Theoretical estimates are obtained and an experimental study is made of the coupling of radiation from stripe and channel semiconductor lasers into single-mode fiber waveguides of two-and three-layer (W) types. Investigations of several variants of the matching devices are reported. It is shown that sufficiently efficient matching of stripe light sources to single-mode waveguides is achieved by axisymmetric focusing components (focons) and a calculation is reported of the optimal parameters of focons. A method for the fabrication of focons is described. The power coupled into two- and three-layer (W-type) single-mode waveguides is in the range 0.5-1 mW. The coupling into W-type waveguides is more efficient than in the case of two-layer waveguides. (19 refs.)

66407 Light-controlled transparencies for storing optical images. V.V.Belov, V.A.Elistratov, G.A.Lebedina, V.F.Nazvanov, E.P.Shebanin (Sci.-Res. Inst. of Mech. & Phys., N.G. Chernyshevskii State Univ., Saratov, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1359-61 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2210-14 (Nov. 1982). [received: May 1983]
Light-controlled storage transparencies (image converters) are studied systematically for the first time. The transparencies consist of stratified photoconductor-liquid crystal and photoconductor-electrochromic material structures. Photoconducting CdS:Na, Cu, and Cl films which exhibit photoelectric memory (residual conduction) at room temperature are used in the photoconducting layers. (15 refs.)

66408 Information transmission equipment with light guides between stationary and mobile objects. H.Pohlers, R.Ide (Ingenieurhochschule Wismar, Wismar, Germany).
Fernmeldetechnik (Germany), vol.23, no.2, p.68-71 (1983). In German.
In communications, light pipes are arranged in a stationary manner mainly. However, for military purposes and certain public events temporary flexible

arrangements are advantageous, particularly in case simultaneous transmission of energy and signals is needed. Compared to wireless operation, transmission with a flexible light guide reduces the requirements for technical equipment. The principle of information transmission between stationary and mobile objects is explained. The mechanical and optical behaviour and properties of flexible light guides are analyzed. The main problem in the entire system is represented by the coupling of the two ends of light guides. All related aspects are discussed in detail. (6 refs.) *K.A.K.*

42.82 INTEGRATED OPTICS

(for optical waveguides see also 42.80L)

66409 Integrated optics wave front measurement sensor. R.H.Rediker, T.A.Lind, F.J.Leonberger (Lincoln Lab., MIT, Lexington, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.647-9 (15 April 1983).
First results are presented demonstrating the feasibility of using an integrated optics array of Mach-Zehnder dielectric-waveguide interferometers to measure the phase and amplitude across an optical wave front. The interferometers are formed from single-mode waveguides produced by Ti diffusion into $LiNbO_3$. The spacings between the arms of the interferometer is 20 μm. The phase difference ϕ between the optical waves incident on the two interferometers arms is measured and compared with theory. The excellent and reproducible agreement between experiment and theory over a number of interferometers suggests that the accuracy of the wave front measurement sensor should be attractively high, limited only by signal statistics and noise considerations. As example, a sensor design is given for which the RMS deviation (1σ) in the value of ϕ is less than 4.5° (the RMS deviation in the optical path difference is less than $\lambda/80$). (6 refs.)

66410 Integrated optics: electrical fields control light. J.O.Akerlund.
Eltek. Aktuell Elektron. (Sweden), vol.26, no.6, p.20-1 (April 1983). In Swedish.
The author describes the function of integrated optical components for communication in the GHz region. The use of lithium niobate in such components is described, as well as the principles of the function of such devices. The range of possible operations such as modulation, time multiplexing and demultiplexing is also described. The author concludes by describing briefly the control of light by magnetic as well as acoustic devices. (no refs.) *H.J.P.*

66411 Geodesic lens of rotational symmetry with axis parallel to light propagation direction. M.Gaj, J.Osinski (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.189-94 (1982).
A new type of geodesic lens, of which the axis of rotational symmetry is parallel to the planar thin film waveguide has been proposed. In particular, the method of evaluation of a parallel beam of rays passing through this particular type of geodesic lens has been proposed and the results of numerical calculations have been presented. This lens is created by rotating the curve (generating curve) of the form $z=f(v)=a(1-v)^{1/2}$, where z—axis of symmetry (axis of revolution), v—normalized distance of surface point with the axis, a—constant factor. 66412 Interferometric countercheck in precision cementing. G.K.Sharma, G.P.Dimri (Instruments Res. & Dev. Establ., Dehra Dun, India).
Appl. Opt. (USA), vol.22, no.8, p.1132-3 (15 April 1983).
It is possible by observing the number of Newton's rings in the air gap between the surfaces to be cemented to a doublet and comparing them with the ring pattern after cementing to deduce the nature of cementing and the uniformity or thickness of the cement layer. The authors discuss this feature and outline its applications. Considerable advantage is obtained if this procedure is followed to reduce subsequent failures due to improper cementing in the system as a whole. (1 ref.)

66413 Computer-controlled polishing of telescope mirror segments. R.A.Jones (Perkin-Elmer Corp., Norwalk, CT, USA).
Opt. Eng. (USA), vol.22, no.2, p.236-40 (March-April 1983).
A method of reducing the cost of large optical telescopes is the use of a segmented primary mirror. The computer-controlled polisher approach is ideally suited to the fabrication of telescope mirror segments. Since the process achieves controlled material removal by regulating the tool motion, there is no need for any surface symmetry. Recent experiments have demonstrated the ability of this process to figure mirror segments. (6 refs.)

66414 Self-calibrating surface measuring machine. A.H.Greenleaf (Itek Optical Systems, Lexington, MA, USA).
Opt. Eng. (USA), vol.22, no.2, p.276-80 (March-April 1983).
A new kind of surface-measuring machine has been developed under government contract at Itek Optical Systems, a Division of Itek Corporation, to assist in the fabrication of large, highly aspheric optical elements. The machine uses four steerable distance-measuring interferometers at the corners of a tetrahedron to measure the positions of a retroreflective target placed at various locations against the surface being measured. Using four interferometers gives redundant information so that, from a set of measurement data, the dimensions of the machine as well as the coordinates of the measurement points can be determined. The machine is, therefore, self-calibrating and does not require a structure made to high accuracy. A wood-structured prototype of this machine was made whose key components are a simple form of air bearing steering mirror, a wide-angle cat's eye retroreflector used as the movable target, and tracking sensors and servos to provide automatic tracking of the cat's eye by the four laser beams The data are taken and analyzed by computer. The output is given in terms of error relative to an equation of the desired surface. In tests of this machine, measurements of a 0.7 m diameter mirror blank have been made with an accuracy on the order of 0.2 μm rms. (no refs.)

66415 On the Bragg-diffraction of surface acoustic waves by acoustic grating. Wang Zou-Qing, Zhou Su-Hua, Wang Cheng-Hao (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.156-67 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The surface acoustic wave diffraction phenomena on acoustic gratings in Bragg regime have been explored. The model approach has been used to treat this problem under strong Bragg condition. Some results, including the eigen-modes in the grating, the equation of the deflected angles, and the analytical expression of deflection efficiency which depends on the operation frequency and the grating parameters, have been obtained. Experimentally, the image of the diffraction acoustic fields on acoustic grating which was composed of some aluminium film stripes on y-cut $LiNbO_3$ crystals have been visualized by means of Schlieren method. Some excellent photographs of diffraction fields have been obtained, and the deflection angles and deflection efficiency at different frequency have been measured by using optical method. The comparison between the theoretical and the experimental results shows that the agreement is satisfactory. (13 refs.)

66416 On the scattering of sound by a vortex ring. M.S.Howe (Faculty of Math. Studies, Univ. of Southampton, Southampton, England).
J. Sound & Vib. (GB), vol.87, no.4, p.567-71 (22 April 1983).
An analytical treatment is given of the scattering of sound by a circular vortex ring translating at low Mach number in an unbounded stationary medium. The theoretical results complement the recent numerical investigation of this problem by Kambe and Myo Oo (1981). (6 refs.)

66417 Acoustics of an obstacle inside a reactive silencer. A.Bostrom (Inst. of Theoretical Phys., Goteborg, Sweden), B.Nilsson.
J. Sound & Vib. (GB), vol.87, no.4, p.603-19 (22 April 1983).
The transmission and reflection of sound in a cylindrical duct containing several discontinuities is investigated. A building-block method, which gives the transmission and reflection matrices for a complex system from those of the parts, is applied to bifurcations, sudden area changes with or without extended inlets, and spherical obstacles (which may be lossy). In some cases the solution can be interpreted in terms of multiple reflections. When the lengths between the discontinuities are small it is important to include also nonpropagating modes, and this is especially true when the sudden area change is obtained from the area change with extended inlet in the limit of vanishing inlet. For an expansion chamber (a portion of the duct with larger radius) with or without an obstacle and with or without inlets a number of numerical results with variation in frequency are presented. Numerical results for the various building-block elements of the expansion chamber are also considered. (15 refs.)

66418 Transmission of acoustical waves through a thin elastic plate in the cylindrical waveguide. D.P.Kouzov, G.L.Nikitin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.24-30 (Feb. 1983). In Russian.
Sound transmission through a thin elastic plate in the cylindrical waveguide is investigated by analytical and numerical methods. Resonance classification for this system is given. (6 refs.)

66419 The edge field behaviour for the problem of the diffraction of a line source by a soft/hard half plane. A.D.Rawlins (Brunel Univ., Uxbridge, England).
Z. Angew. Math. & Mech. (Germany), vol.63, no.3, p.211-12 (1983).
The author discusses the diffraction of an acoustic wave by a half-plane. The edge field behaviour can be obtained from a result of Williams (1978). The

author also considers the more general problem of a line source, but this does not affect the edge field behaviour. (6 refs.)

66420 Difference equation technique for determining the evolution of radially symmetric ultrasonic fields. G.D.Dockery, R.O.Claus (Dept. of Electrical Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.511-15
A simplified difference equation technique has been developed to calculate the three-dimensional evolution of radially symmetric, complex ultrasonic fields. The parabolic approximation to the Helmholtz equation is obtained by assuming that localized changes in the magnitude of the field with respect to distance along the axis of propagation are small compared to those with respect to radial displacement. The Helmholtz equation in cylindrical coordinates may then be approximated, after separating variables, using truncated series expansions. The resulting difference equation determines complex field values at discrete locations in a plane using corresponding adjacent locations in the preceding plane. Stability criteria which determine acceptable values for various parameters are discussed. The technique has been applied to the propagation of ultrasonic fields generated by two-dimensional focusing and non-focusing, uniform and Gaussian profile, piezoelectric transducers in both profiled and non-profiled media. (7 refs.)

66421 Nonlinear quantum acoustics. V.A.Golenishchev-Kutuzov (Kazan Physicotech. Inst., Acad. of Sci., Kazan, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.574-8 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.145-8 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
This review gives a systematic presentation of nonlinear phenomena occurring during the propagation of acoustic pulses whose length is shorter than all the irreversible relaxation times in dielectric and magnetic materials under the conditions of resonance interaction with quantum ensembles in the medium. The particular feature of these phenomena is that relaxation processes cannot erase the phase memory of the excited system, so that its polarization is a nonlinear function of the amplitude and phase of the external field. Nonlinear phenomena such as induction, echo, and self-induced transparency were at first investigated only at radio frequencies under the conditions of NMR and ESR, but were subsequently detected in the optical range. Spin systems in solids have only recently begun to be investigated with the aid of acoustic pulses. (10 refs.)

66422 Measurements of harmonic profiles of a bounded ultrasonic beam in a liquid medium. D.D.McLennan, T.D.K.Ngoc, W.G.Mayer (Phys. Dept., Georgetown Univ., Washington, DC, USA).
Ultrasonics (GB), vol.21, no.3, p.103-6 (May 1983).
The acoustic field of a bounded finite-amplitude beam is governed by competing mechanisms such as medium non-linearity, interference, and attenuation. An analytic determination of the distribution of sonic energy in the individual harmonic components is often not reliable; consequently an experimental mapping of those harmonic components may be more appropriate. An experimental method is presented here which involves a miniature hydrophone probe which has been frequency calibrated for each harmonic component using a light diffraction technique. Measurements (made across the sound field) of the acoustic amplitude of the first three harmonic components are presented. (7 refs.)

66423 Non-linear behaviour and stability of trapped micron-sized cylindrical gas bubbles in an ultrasonic field. E.A.Neppiras, W.L.Nyborg, D.L.Miller.
Ultrasonics (GB), vol.21, no.3, p.109-15 (May 1983).
Stable arrays of cylindrical bubbles with diameters 3 and 4 μm were produced by trapping air in the pores of hydrophobic nuclepore filters. These bubble arrays were irradiated by beams of CW and pulsed ultrasound at carrier frequencies near the resonance frequencies of the trapped bubbles. By examining the frequency spectrum of the field scattered by the arrays it was found that the bubbles may oscillate as non-linear stable cavities of long duration. Using short pulses, the bubbles remain stable up to excitation pressure amplitudes of several bars. Mechanisms for the eventual growth and decay of the bubbles are discussed in light of the observations. (23 refs.)

43.60 ACOUSTIC SIGNAL PROCESSING

66425 A microcomputer based special analysis and multi channel monitoring system for dynamic signals. M.P.Sun.
Noise & Vib. Control Worldwide (GB), vol.14, no.2, p.45-7 (March 1983).
The technique of interfacing standard and well proved computer hardware to extend the capabilities of a basic spectrum analyser offers many advantages. The spectrum analyser retains the simplicity of a stand-alone instrument, uncluttered with built-in peripheral features which may or may not be required by the user. The reliability of such an instrument can be assumed to be better, since its only task is to rapidly Fourier transform the time signal. The microcomputer is a high-volume sales item resulting in cost advantages and good technical support. It is well suited to providing the post processing applications in terms of both speed and memory capability. Processing on both machines can take place in parallel and the spectrum analyser and computer can work independently of each other. Direct access to the software and a wide choice of optional hardware makes the system flexible and versatile, so that individual users' requirements may easily be implemented. (no refs.)

66426 Dispersive relay lines using 180° reflecting metal dot arrays. R.C.Woods (Plessey Res. (Caswell), Towcester.Ltd.,England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.4/1-4
The reflective array compressor (RAC) is a dispersive delay line designed for use in, for example, high performance pulse-compression systems. Recently, the 'in-line' RAC has been introduced using reflection by grooves once through 180°. Its advantages over conventional 90° reflective devices are that a single direction of propagation is used, there is only a single reflection so that the insertion loss can be low, and there is greater design flexibility since rapid changes in weighting can be accommodated. Both the 'in-line' and the conventional grooved RACs suffer from the disadvantage of requiring both photolithography and ion-beam milling for fabrication. Solie (1979) suggested the use of reflecting metal dot arrays to overcome this. The reflecting metal dots are produced simultaneously with the IDTs by photolithography; amplitude weighting of the passband response can be accomplished by varying the number density of dots on the surface. This paper reports the development of the in-line dot RAC in which the surface waves are reflected through 180° by arrays of thin aluminium dots. (5 refs.)

66427 Low loss SAW filter techniques. R.T.Biggs, F.S.McClemont (Hirst Res. Centre, GEC Res. Labs., Wembley, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.5/1-2
SAW filters employing two bidirectional interdigital transducers for input and output have typical insertion losses in excess of 20 dB. Electrical mismatch is necessary for the bidirectional transducer to reduce spurious signals within the filter which give rise to amplitude and group delay ripple within the passband. Various techniques for obtaining low loss together with low amplitude and group delay ripple have been reported. The implementation of any one of these methods depends upon the constraints of the problem, but in general it is the multiphase transducer which offers the most flexibility in bandpass shape, coupled with insertion losses dependent entirely on parasitics. (10 refs.)

66428 SAW convolver employing unidirectional transducers for improved efficiency and variable bandwidths. C.L.West (Ministry of Defence, Royal Signals & Radar Establ., Malvern, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.11/1-4
In the past few years the surface acoustic wave (SAW) convolver has become the subject of much investigation. The convolver operates through the non-linear interaction of two counterpropagating acoustic waves, usually SAW on a piezoelectric substrate such as $LiNbO_3$. In previously reported devices it has been usual to launch the SAW using conventional bidirectional interdigital transducers (IDT). These transducers have the inherent property that SAW are launched in both directions and therefore, as only one of these directions is useful, only half of the input power is employed in the device. A unidirectional transducer would eliminate this waste and, if properly matched to the source/load would also help to eliminate the acoustic reflections from the device thereby reducing self convolution levels. Unidirectional transducers can be realised using various schemes. Many of these produce unidirectional transducers which are narrow band (group type, meandering electrode) and are thereby not applicable to wideband convolvers. In this paper results are presented for convolvers with a centre frequency 300 MHz, bandwidths of 15-40% and high convolution efficiency -70 to -54 dBm. (12 refs.)

66429 Design, fabrication and application of acoustoelectric memory correlators. G.R.Adams (Standard Telecommunication Labs., Harlow, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.12/1-4
The combination of surface wave and semiconductor functions in a single monolithic structure represents a significant advance in the evolution of analogue signal processing devices. An important example of this class of processor is the SAW acoustoelectric memory correlator. In this device the r.f. electric field associated with a propagating surface wave is sampled and stored in a diode array where subsequently it can either be correlated with a copy of itself or recovered intact for retransmission. Memory correlators employing sputtered ZnO thin film overlays on a GaAs substrate, containing a matrix of Schottky diodes, are being researched at STL for applications as radar receiver matched filters and analogue r.f. memories. (no refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

66430 The sound of music [noise levels in concerts]. K.Szymanski (State Inst. for Building, Warsaw, Poland).
Noise & Vib. Control Worldwide (GB), vol.14, no.2, p.54 (March 1983).
In order to discover whether participants at concerts of symphonic music are exposed to a dangerous level of noise, a series of measurements of equivalent continuous noise levels was made during symphonic concerts of the National Philharmonic Orchestra in Warsaw. The measurements covered 10 works composed by Mozart, Beethoven, Chopin, Debussy, Prokofiev and Panufnik. Amongst these works were symphonies, overtures, oratoria, violin and piano concertos. The measured levels start from 72.6 dB(A) for Mozart's violin concerto in A major (KV 201) and end at 85.3 dB(A) for Prokofiev's piano concerto No.3. The results obtained in this way show that symphonic music does not have any dangerous influence on the audience in concert halls. (2 refs.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

66431 A new type of laser probe. R.G.Stearns, G.S.Kino, B.T.Khuri-Yakub (W.W. Hansen Labs. of Phys., Stanford Univ., Stanford, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.659-61 (15 April 1983).
A new technique to measure surface acoustic wave beam profiles is described. A measurement is made of the average phase change of the acoustic wave resulting from periodic heating of the sample surface by an incident modulated laser beam. Scanning of the laser beam across the acoustic wave results in a profile of the energy density in the acoustic beam. To measure the phase change, a surface acoustic wave oscillator configuration is used. Possible application of the technique to the measurement of applied and residual surface stress is discussed. (8 refs.)

66432 Precision methods for determining sound power levels. H.Schmidt.
Noise & Vib. Control Worldwide (GB), vol.14, no.2, p.38-42 (March 1983).
More and more frequently, the sound power level of machines is needed. For precision sound measurements, two dissimilar test methods are used; the reverberation room method and the free-field method in anechoic or semi-anechoic rooms. The author discusses the equipment and ventilation, the noise insulation, and the problem of access (entrance doors). Anechoic chambers are most frequently installed in mechanical and technical development centres. The chambers are also built for testing and calibrating electro-acoustic devices, as well as for audiological, auditory, psychological and physical tests. (4 refs.)

66433 The use of subminiature probe microphones to determine the attenuation of earmuff hearing protectors. J.L.Pehringer, D.A.Preves (Starkey Labs., Minneapolis, MN, USA).
Noise & Vib. Control Worldwide (GB), vol.14, no.2, p.49-53 (March 1983).
Determines the practicability and applicability of real ear probe microphone measurements in the determination of ear protector effectiveness. Employing the probe microphone technique is an innovative, reliable method for assessing the performance characteristics of a hearing protector device in situ. Based on experimental data, the feasibility and applicability of real ear probe microphone measurements of an earmuff's attenuation characteristics for a particular individual under actual conditions seems to be a viable alternative to the traditional method of obtaining attenuation data using theshold shift. (4 refs.)

66434 From laboratory to industry [ultrasonic materials testing]. V.Langone, R.Teti.
Tecnol. Elettr. (Italy), no.2, p.66-72 (Feb. 1983). In Italian.
Napoli University laboratory activity in materials testing by instrumentation using acoustic emissions is described. Instrumentation organisation is detailed showing testing range, basic requirements and instruments design. Acoustic emission detection techniques are highlighted quoting test results and elaborating test techniques. Usefulness in testing compound materials is underlined. (no refs.) *T.H.*

66435 Characteristics of noise attenuators for use in acoustic emission studies. G.G.Martin (Materials Engng. Dept., Monash Univ., Clayton, Victoria, Australia).
Ultrasonics (GB), vol.21, no.3, p.127-33 (May 1983).
The background noise generated by servo-hydraulic machines commonly used in laboratory tests of materials prevents the extraction of the maximum amount of acoustic emission data during fatigue experiments. Some of the solutions for removing background noise during monotonic tests are not applicable, and modern acoustic emission (AE) monitoring systems cannot detect all AE generated in the presence of continuous background noise. The best technique for reducing the background noise appears to be the insertion of a noise attenuating barrier between the noise source and the test specimen. Multilayer sound transmission theory is outlined to show that noise attenuators must be designed for the particular frequency at which the AE system is to operate. The theoretical basis for obtaining (for a given application) the optimum attenuation from attenuators constructed on an acoustic impedance mismatch basis is provided. Finally, physical properties of materials suitable for use in attenuator construction are tabulated. (17 refs.)

66436 SAW resonator performance. R.J.Smith (Central Materials Lab., Mullard Ltd., Mitcham, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.8/1-3
The aim of this work is to establish the technology for the manufacture of SAW resonators. A 404 MHz resonator on ST cut quartz has been used as the subject of the study. Whilst many areas of production technology have been investigated the achievement of target frequency and the subsequent frequency stability on storage have been major areas of investigation. (3 refs.)

43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

66437 Equivalent circuit and input impedance of a piezoelectric transducer with internal losses. V.I.Ivanov (Central Sci.-Res. Inst. of Technol. & Mech. Engng., Moscow, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.589-93 (Aug. 1982). Translation of: *Defektoskopiya (USSR),* vol.18, no.8, p.14-18 (Aug. 1982). [received: April 1983]
Expressions are derived for the electrical input impedance and equivalent circuit of a piezoelectric transducer with the rigorous inclusion of dielectric and mechanical losses. The results can be used to analyze the operation of piezoelectric transducers for ultrasonic flaw detection and acoustic emission. (6 refs.)

66438 Design of impedance-type ultrasonic lens system on basis of prescribed field distribution in focal plane. V.I.Korochentsev, A.V.Kuznetsov (V.V. Kuibyshev Far-Eastern Polytech. Inst., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.597-600 (Aug. 1982). Translation of: *Defektoskopiya (USSR),* vol.18, no.8, p.22-5 (Aug. 1982). [received: April 1983]
The law of impedance variation over the reference surface of an ultrasonic lens is determined which will yield a field of a given form in the focal plane. A sectorial field distribution in the focal plane is designed as an example. (6 refs.)

66439 Volumetric piezoelectric transducers with surface excitation. M.V.Korolev, A.E.Karpel'son, B.P.Starikov (Sci. Res. Inst. of Introscopy, Moscow, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.621-8 (Aug. 1982). Translation of: *Defektoskopiya (USSR),* vol.18, no.8, p.48-57 (Aug. 1982). [received: April 1983]
Surface-excited, resonant (volumetric) piezoelectric transducers having uniform and nonuniform polarizations are considered. Their amplitude-frequency responses in the transmitting and receiving modes are analyzed as well as the frequency dependence of the modulus of their electrical impedance. A study is made of the acoustic fields for various types of these piezoelectric transducers. (8 refs.)

66440 A calculation scheme for the optimum design of ultrasonic transducers. S.J.H.van Kervel (Electroson BV, Liempde, Netherlands), J.M.Thijssen.
Ultrasonics (GB), vol.21, no.3, p.134-40 (May 1983).
A calculation scheme that establishes the transfer function of a thickness-mode piezoelectric transducer is described. A computer program enables flexible manipulation of the design. Parameters that can be inserted are the properties of the piezo-material, the quarter-wavelength layer(s), the backing load and the electrical tuning and matching. Optimization criteria such as maximum bandwidth, optimum dynamic range, minimum pulse duration and minimum round-trip insertion loss (or maximum efficiency) are discussed. (8 refs.)

66441 Overview of SAW devices. C.W.Turner (King's College London, London, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.1/1
Almost 20 years have passed since the first SAW devices were demonstrated. The wide applicability of SAW devices in signal processing was not immediately recognised at first, but major improvements in interdigital electrode transducers stimulated a rapid growth of R and D effort in SAW technology. Nowadays system designers can call upon a variety of mature SAW devices able to meet demanding specifications in the frequency range from about 10 MHz to over 1 GHz. (no refs.)

66442 Reflection of surface acoustic waves by thin metal dots. F.Huang, E.G.S.Paige (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.2/1-3
In a common configuration for SAW devices, frequency-selective transducers convert an electrical signal into an acoustic wave and back to an electrical

signal. Both transduction and the response of the device are determined by the transducer. An alternative arrangement is to have frequency-selective reflecting arrays in the acoustic beam; the transducers can then be designed with fewer constraints and be made as efficient as possible. One source of reflection is the metal partly shorting out the potential that accompanies the surface wave on a piezoelectric material. With strips on a strongly piezoelectric material, this can give an inconveniently large reflection. The replacement of the strip with a row of dots gets over this problem. This paper describes a theory to determine reflectivity and change of velocity due to thin metal dots. Experimental results are also given. Thick dots, whose reflection mechanism is primarily mechanical rather than piezoelectric, are not described here. (2 refs.)

66443 Wave analysis of IC-compatible UHF BWCR (bulk wave composite resonator). R.F.Milsom, W.Pollock (Philips Res. Labs., Redhill, England).
Colloquium on 'Saw Devices', London, England, 23 Feb. 1983 (London, England: IEE 1983), p.14/1-6
Fundamental mode UHF bulk acoustic wave (BAW) resonators have received considerable attention in recent years. One configuration of special interest is the thickness extensional mode resonator employing zinc oxide thin films on silicon. The attraction of these devices is that they offer integration of high Q-factor BAW resonators and filters with other IC components. Theoretical analysis of these devices has been limited to a comparatively simple one-dimensional model. Here details of a two-dimensional analysis are presented. It is shown that there is strong coupling between the fundamental extension motion and the second harmonic shear motion, giving rise to a family of inharmonic modes closely spaced in frequency. This type of resonator response has been observed and described in earlier work. The equivalent electrical parameters of these resonances are computed as functions of the resonator geometry. (10 refs.)

44.00 HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

66444 The heat equation with singular coefficients. I. Operators of the form $-d^2/dx^2+\kappa/x^2$ in dimension 1. C.J.Callias (Dept. of Math, Columbia Univ., New York, NY, USA).
Commun. Math. Phys. (Germany), vol.88, no.3, p.357-85 (March 1983).
The small time asymptotics of the kernel of e^{-tH} is defined and derived for $H=d^2/dx^2+\kappa/x^2$ on $\mathbf{R}^1$. Lemmas on singular asymptotics in the sense of distributions are formulated and used. The results are applied to derive an index formula on $\mathbf{R}^1$. (9 refs.)

66445 A new proof and generalization of the maximum principle of heat conduction. H.Farkas (Inst. of Phys., Tech. Univ. Budapest, Budapest, Hungary).
J. Non-Equilibrium Thermodyn. (Germany), vol.7, no.6, p.355-62 (1982).
The physical content of the maximum principle of heat conduction is discussed. It is shown that the maximum principle is closely related with the second law of thermodynamics. A generalization of the maximum principle valid for a wide class of heat conduction problems is proved on the basis of the Governing Principle of Dissipative Processes. (17 refs.)

66446 Heat conduction through a thin, poorly conductive layer. L.E.Bobisud (Univ. of Idaho, Moscow, ID, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.85-97 (April 1983).
The author considers a model in which a thin sheet of poor conductivity occurs between two conducting materials and seeks an asymptotic representation as the thickness and conductivity of this sheet go to zero. A change in the form of the connection condition is anticipated as a reflection of the singularity of the perturbation. (3 refs.)

44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

66447 The unsteady heat transfer from an oscillating sphere in a viscous fluid. N.Dohara (Dept. of Mech. Engng., Iron & Steel Tech. Coll., Hyogo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1178-85 (April 1983).
The problem of unsteady heat transfer from a solid sphere, performing harmonic oscillations in an unbounded viscous fluid otherwise at rest, is investigated for small values of the Reynolds number. The analysis on the temperature field is carried out up to the third order of the Reynolds number. The time-averaged Nusselt number is obtained. The mechanisms of the oscillatory heat transfer are clarified theoretically. (8 refs.)

66448 Phonon transmission theory of heat transfer through solid-gas interfaces. G.Dharmadurai (Reactor Res. Centre Kalpakkam, Tamil Nadu, India).
Phys. Status Solidi b (Germany), vol.116, no.1, p.307-11 (1 March 1983).
The heat flow is investigated from a hot solid into a gaseous medium using the phonon transmission theory. This basic approach correctly predicts the essential features of the temperature jump occurring at solid-gas interfaces during heat flow across the boundary and the predictions agree well with recent measurements of heat transfer between microspheres of UO_2 in helium and nitrogen atmospheres. The results suggest that the medium-medium acoustic mismatch dominates the heat transfer through these interfaces. (10 refs.)

(see also 05.70 Thermodynamics, 07.20 Thermal instruments and techniques)

66449 An apparatus for the investigation of low-temperature, high-pressure, vapor-liquid and vapor-liquid-liquid equilibria. W.Dorau, H.W.Kremer, H.Knapp (Inst. of Thermodynamics & Plant Design, Tech. Univ., Berlin, Germany).
Fluid Phase Equilibria (Netherlands), vol.11, no.1, p.83-9 (April 1983).
A fluid phase equilibrium apparatus has been designed, built and tested for an operating range of $70<T<300K$ and $1<p<200$ bar. It consists of a high-pressure cell with an optical inspection device, a gas circulation system, a cryostat, and instrumentation for the measurement or control of temperature, pressure and composition. Accurate experimental VLE and VLLE data are useful as a basis for process design or for testing and improvement of correlations. (3 refs.)

44.90 OTHER TOPICS IN HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

66450 Effective monochromatic emissivity of cavity with arbitrary anisothermality. S.P.Rusin, K.S.Mukhamed'yarov (Inst. for High Temperatures, Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.545-51 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.658-64 (July-Aug. 1982). [received: April 1983]
Data are presented for a computer experiment for several temperature distributions typical in the measurement of the temperature from cavity radiation. It is found that, if the temperature at a given point is less than that of the other points on the surface of the cavity, there will be in general a wavelength for which the measured brightness temperature will be equal to the true temperature. In the measurement of brightness temperature a crucial role is played by a temperature function which depends strongly on the temperature level and on the wavelength of the radiation being recorded. A simple method for estimating the effective emissivity of an anisothermal cavity is introduced. (6 refs.)

46.00 MECHANICS, ELASTICITY, RHEOLOGY

46.10 MECHANICS OF DISCRETE SYSTEMS

(see also 03.20 General mathematical aspects)

66451 On static and dynamic finite element analysis of helical springs and experimental verifications. Wen-Hwa Chen, Pwu Tsai (Dept. of Power Mech. Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Chin. Inst. Eng. (Taiwan), vol.6, no.1, p.9-20 (Jan. 1983).
Based on the variational principles, the authors present a rigorous finite element procedure to study the static and dynamic characteristics of helical springs. To characterize the effects of curvature, torsion (or pitch angle), shear force and rotary inertia, the so-called 'space-curved' beam element is devised. Results show that the 'space-curved' beam finite element model accurately reveals the significant influence of curvature, torsion (or pitch angle) and shear force effects on the computation of tension and torsion constants. Furthermore, the present model can be used to predict tension, torsion and mixed-mode natural vibrations can compensate for the lack of experimental and classical approaches. Good correlation between the directly computed 'space-curved' beam finite element solutions and experimental results has also been established for the spring subjected to impact loadings. Lastly, a large-deflection dynamic analysis is employed to study the effect of geometric nonlinearity. (19 refs.)

66452 Attitude stability of torque-free axisymmetric dual spinners with energy sinks, considering spin change allotment between rotor and platform. F.Rimrott, You-Sin-Li (Dept. of Mech. Engng., Univ. of Toronto, Toronto, Ontario, Canada).
Mech. Res. Commun. (GB), vol.9, no.6, p.403-10 (Nov.-Dec. 1982). [received: March 1983]
The authors introduce a spin change allotment factor η, by means of which the energy flow between rotor and platform can be clearly quantified. This makes it possible to differentiate between the kinetic energy change dT^R of the rotor and the energy dD^R absorbed by the rotor, and between the kinetic energy change dT^P of the platform and the energy dD^P absorbed by the platform. An exact value of η cannot be quoted a priori for a given dual spinner. It is, however, possible in principle to measure it in an experiment. The spin change allotment factor η includes all effects that contribute to damping, with the exception of frequency. (3 refs.)

66453 Optimal displacement of a pendulum with a phase constraint on the velocity of the suspension point. A.T.Zaremba.
Mech. Solids (USA), vol.17, no.3, p.22-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.28-34 (1982).
Considers the problem of time-optimal displacement of a pendulum from a rest state over a specified distance with suppression of oscillation at the end of the process. It is assumed that the acceleration of the suspension point of the pendulum does not exceed some maximum permissible absolute value, and also that the velocity of the suspension point is bounded, and this leads to a control problem with a phase constraint. The constraints considered reflect the basic operating properties of electric drives for hoisting machines, which provide smooth (i.e. roughly constant) acceleration or deceleration of the system with a limited maximum displacement velocity. (7 refs.)

66454 Vibration damping by controlling the stiffness. H.Loose, B.Heimann.
Mech. Solids (USA), vol.17, no.3, p.28-36 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.35-44 (1982).
Investigates a mechanical system consisting of a vibrating mass and linear-elastic element with controlled stiffness (damper), which connects the mass to a fixed foundation. The problem of optimal suppression of vibrations which arise after impulsive impacts is solved by controlling the stiffness of the damper, when the system is acted upon by a constant force. Free vibration of the resultant system (exact and approximate solution) is considered. An asymptotic approximation to periodic steady forced vibration of the system under a harmonic load with constant and frequency-dependent amplitude is constructed. (8 refs.)

66455 Problem of impact of a two-element mechanism. E.M.Rubanovich, A.M.Formal'skii.
Mech. Solids (USA), vol.17, no.3, p.37-43 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.45-51 (1982).
Considers a plane mechanism consisting of two hinged elements. The end of one of the elements is located on an impenetrable surface, i.e. a nonconfining constraint is imposed on the system. At some point in time the end of the other element touches the surface with an absolutely inelastic impact. The motion of the system after impact is investigated. The authors consider the case of arbitrary direction (prior to impact) of the velocity vector of the end of the impacting element, when new effects arise. The results are of interest for problems involving the dynamics of bipedal locomotion. (8 refs.)

46.20 CONTINUUM MECHANICS

(see also 03.40 General mathematical aspects)

66456 Methods for computing optimal bounds on deformation in the theory of workhardening adaptation. I.Kaneko (Univ. of Wisconsin, Madison, WI, USA), C.Mazzarella, C.Polizzotto.
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.37, no.2, p.185-204 (April 1983).
Deals with rigid-workhardening structures subjected to dynamic loadings. Within the theory of workhardening adaptation, a bounding technique is studied. Numerical methods for computing optimal bounds on deformation are given and illustrated by means of a simple frame structure. It is demonstrated that the computed optimal bounds are fairly accurate. (16 refs.)

66457 Discrete and non-discrete mixed methods applied to eigenvalue problems of plates. F.Fujii, T.Hoshino (Dept. of Civil Engng., Gifu Univ., Gifu, Japan).
J. Sound & Vib. (GB), vol.87, no.4, p.525-34 (22 April 1983).
A mixed variational formulation for eigenvalue problems of plates is presented. Spline functions with multiple nodes are used to interpolate the displacement and moment fields. The solution procedure can be applied in either discrete or non-discrete forms. In contrast with displacement methods, the specified boundary conditions can be considered very easily by introducing multiplicity in the boundary nodes. Numerical examples include buckling and free vibration, of rectangular plates, with in-phase loading and or elastic foundations. The accuracy of the results obtained and the superiority of the mixed methods presented to conventional displacement approaches are discussed. (15 refs.)

66458 Toward an extremum characterization of kinetic stability. J.G.Papastavridis (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Sound & Vib. (GB), vol.87, no.4, p.573-87 (22 April 1983).
The Hamiltonian action-based stability ideas of Routh (1905) are combined with Trefftz's (1933) variational formulation of the adjacent configuration method of static buckling into a comprehensive time-integral-of-energy-based extremum criterion of kinetic stability. Specifically, if the action functional along a fundamental path is a minimum for an arbitrarily long time interval of integration then the path is unstable, whereas if it ceases to do so at some point, then the path is stable up to that point; this latter leads to a direct method for approximate stability limit calculations. Some relevant analytical tools are also discussed, and finally applications of the criteria to the stability of equilibrium, and that of the steady state of Duffing's (cubic and harmonically-forced) oscillator are presented. (29 refs.)

66459 On the solar coefficient in Timoshenko's beam theory. J.J.Jensen (Dept. of Ocean Engng., Tech. Univ. of Denmark, Lyngby, Denmark).
J. Sound & Vib. (GB), vol.87, no.4, p.621-35 (22 April 1983).
Some existing formulations for the shear coefficient in Timoshenko's beam theory are discussed, especially through evaluation of the accuracy to which natural frequencies of simply supported, prismatic, thin walled beams can be obtained. The main conclusion drawn is that if a consistent expression for the shear coefficient, such as those given by Cowper [1966] or Stephen [1980], is used in Timoshenko's beam theory, then very high accuracies can be expected for the natural frequencies, even for wavelengths of the same magnitude as the transverse dimension of the beam. It is noted that no reduction of the moment of inertia due to shear lag effects should be made as these effects are included in the consistent formulas for the shear coefficient. Finally, some apparently paradoxical results indicating that a reduction in shear stiffness occurs in rare cases if more material is added to a section are discussed and explained as resulting from the use of integrated rather than pointwise deflection measures in the derivation of consistent shear coefficient expressions. The results are discussed in the light of the importance of the shear stiffness of the hull girder in ship hull vibration analysis. (15 refs.)

66460 Equations of the linear theory of shells with slowly varying curvatures. S.Lukasiewicz (Politech. Warszawska, Warsaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.167-79 (1981). In Polish.
The fundamental equations are presented of the theory of shells with slowly varying curvatures. In comparison with the author's previous work, a consistent and complete derivation of the fundamental equations is given. The system of differential equations of the theory of shells has been reduced to the system of two differential equations for the normal deflection and the stress function. Two variants of the differential equations have been analysed and it has been proved that in the case of shells of slowly varying curvature they lead to identical fundamental equations. (7 refs.)

66461 An analysis of rod-shield constructions by the finite element method. E.Rusinski (Polytech. Wroclawska, Wroclaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.253-60 (1981). In Polish.
The method of calculating any rod-shield construction by the finite element method is shown. The rigidity matrix of the rod-shield construction for elements of rectangular and triangular shape with three degrees of freedom is given. In a rod-shield element any shape of the rod cross-section may be applied. The rigidity matrix of a rectangular shield and of a four bars frame is also given. The PRTA program was written in FORTRAN 1900 language and was tested on an ODRA 1300 computer. (12 refs.)

66462 The variational principles of mechanics for variable domains and their utilization for structural optimization. K.Dems (Politech. Lodzka, Lodz, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.269-83 (1981). In Polish.
Provides the virtual displacement and stress principles in the case when simultaneous variation of external or internal boundaries bounding an elastic body is considered. Both the conservative and nonconservative, dependent on boundary configuration, load systems are considered. The problem of mean compliance design of a structure with unspecified in advance shape is considered. The optimality conditions are generated for the case of optimal shape design of loaded and free external boundaries as well as for design of interfaces separating materials of different stiffness. 66463 Boundary element method in elastostatics: theory and applications. G.Kuhn (Lehrstuhl Tech. Mech., Univ. Erlangen-Nurnberg, Erlangen, Germany), W.Mohrmann.
Appl. Math. Modelling (GB), vol.7, no.2, p.97-105 (April 1983).
Presents the theoretical foundations of the boundary element method as they are applied in the numerical code BETSY (for: boundary element code for thermoelastic systems). The code is applicable to linear elastostatic problems including thermoelasticity allowing stationary temperature fields and nonvanishing volume forces. When the theoretical fundamentals of the method are presented, a unified approach to the transformations of domain integrals into boundary integrals is formulated, encompassing both plane and spatial problems. The application range of the method is increased by introducing an unbounded solution and by eliminating the domain integral expression due to volume forces. Two illustrative examples show the code in action, pointing out the fundamental usefulness for practical applications. (14 refs.)

66464 Stresses in an internally pressurized thin rectangular prismatic duct. M.Holland (Dept. of Mech. Engng., Liverpool Polytech., Liverpool, England).
Proc. Inst. Mech. Eng. Part C (GB), vol.197, p.71-3 (March 1983).
An elastic analysis is developed which results in equations for the prediction of stresses at principal positions in the duct. These equations express the stress as a function of the aspect ratio and the ratio of the thickness of adjacent sides (opposite sides are taken to be of the same thickness). It is shown that for a fixed 'longest side' length, an optimum stress condition is achieved when the aspect ratio is two-to-one and the four sides have the same wall thickness. (no refs.)

66465 A rational theory of oblique incidence and its extension to stress-separation in birefringent composites. S.K.Chaturvedi (Dept. of Engng. Sci., Univ. of Florida, Gainesville, FL, USA).
Exp. Mech. (USA), vol.23, no.1, p.36-41 (March 1983).
A rational theory of oblique incidence for a birefringent medium is developed. The theory rules out the concept of secondary principal stresses as an arbitrary one and provides more adequate interpretation of isochromatics and isoclinics in oblique incidence. The method is shown to be applicable for stress-separation in an anisotropic-birefringent composite, and the stress-optical equations deduced require an additional stress-fringe constant to those involved in normal incidence. The stress-birefringence relations for isotropic photoelasticity are obtained as a particular case of the general theory. (14 refs.)

66466 An approximate method of orthotropic photoelastic analysis. B.D.Agarwal (Dept. of Mech. Engng., Indian Inst. of Technol., Kanpur, India).
Exp. Mech. (USA), vol.23, no.1, p.55-8 (March 1983).
An approximate strain-optic law has been derived for photoelastic analysis of orthotropic model materials. Principal-strain difference and the direction of major principal strain can be obtained from only two photoelastic measurements (isochromatic-fringe order and isoclinic angle) by means of this

strain-optic law. Limited experiments on models subjected to uniaxial and biaxial stresses indicate good agreement between the experimental results and predictions of the strain-optic law. A parametric study demonstrates that the difference can be predicted within ± 20 percent for most practical values of degree of orthotropy and ratio of principal strains. The error levels are quite acceptable considering the significant ease in analysis provided by the new law and the fact that such error levels are not uncommon in experimental investigations. (8 refs.)

66467 Further considerations on the problem of torsion and flexure of prismatical beams. E.Reissner (Dept. of Appl. Mech. & Engng. Sci., Univ. of California, La Jolla, CA, USA).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.385-92 (1983).
A linear system of one dimensional beam equations is established through use of the principle of minimum potential energy in conjunction with suitable displacement approximations, which takes account of warping stiffness in addition to stretching, transverse shearing, bending and twisting stiffness. This system of equations is used for the asymptotic analysis of a warping boundary layer, including the concept of contracted and reduced boundary conditions for the determination of the state of the beam outside the layer, as well as for the derivation of expressions for cross sectional shear centre coordinates which are more general than previous expressions for these quantities. (4 refs.)

66468 Thermal stress of square region with an elliptical hole. E.Matsumoto, T.Sekiya (Dept. of Aeronaut. Engng., Univ. of Osaka Prefecture, Sakai, Osaka, Japan).
Mech. Res. Commun. (GB), vol.9, no.6, p.397-402 (Nov.-Dec. 1982). [received: March 1983]
The problem of thermal stress with internal heat generation in the square region with an elliptical hole at the center is described. A point-matching method is utilized selecting the appropriate points on the boundaries for numerical calculation. It is shown that the plane thermoelastic problems can easily be formulated by a mechanical analogy, and this method is applied to solve the problem. (4 refs.)

66469 Averaged equations of the theory of elasticity of matrix composites. M.I.Gandel'sman.
Mech. Solids (USA), vol.17, no.3, p.54-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.63-70 (1982).
Within the framework of the self-consistent field method, a systematic derivation of the averaged equations is offered for bounded regions of matrix composite. It is shown that description of the elastic properties of the composite by means of effective moduli corresponds to allowance for interaction of inclusions in the dipole approximation. In this approximation, the theory in question is analogous, from the mathematical standpoint, to the traditional electrostatics of dielectrics. Allowance for high-order multipole terms leads to the appearance in the averaged elastic-equilibrium equations of additional terms with high-order derivatives of the averaged tensor $\epsilon(x)$. Additional terms also appear in the equations that specify the boundary conditions. Thus, allowance for interaction of inclusions in high-order multipole approximations leads to averaged elastic-equilibrium equations, which can be regarded as a variant of multipolar elasticity theory. In this case the description of the elastic properties of the composite is not exhausted by introducing the tensor of the effective moduli. (12 refs.)

66470 Prefailure scheme for composites near holes. A.N.Polilov.
Mech. Solids (USA), vol.17, no.3, p.97-103 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.110-17 (1982).
A scheme is proposed for describing prefailure of composites that leads to 'blunting' of a hole or notch and to a decrease in the effective stress concentration coefficient. The hypothesis of constant size of the prefailure zone, characteristic of the given material, enables one to describe the strength as a function of the dimensions of the stress concentrators by using one experimental parameter, for an extensive class of holes and notches. (12 refs.)

66471 Deformation of an elastic plane reinforced by a periodic system of nonperiodically loaded oblique semi-infinite stringers. G.A.Kamysheva, B.M.Nuller, M.B.Ryvkin.
Mech. Solids (USA), vol.17, no.3, p.104-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.118-23 (1982).
Cyclical symmetry can be used to solve the problem of deformation of a plane weakened by a system of radial cracks. The procedure is applied to the contact problem of deformation of an infinite elastic plate reinforced by a periodic system of semi-infinite rectilinear stringers whose ends lie on the same straight line, are in complete adhesion with the plate, offer no bending resistance, are parallel to one another, and make an arbitrary angle with the straight line in question. A cyclical or arbitrary system of longitudinal tensile forces is applied to the ends of the stringers. The solution is obtained in quadratures. A formula is given for the stress intensity coefficients in the neighborhood of the ends of the stringers. As a result of numerical analysis, it is shown that it is possible to use a simple approximate formula for the intensity coefficient. (10 refs.)

66472 Bending of elastic plates with a regular structure. E.I.Grigolyuk, M.G.Gringauz, V.N.Dolgikh, L.A.Fil'shtinskii.
Mech. Solids (USA), vol.17, no.3, p.110-15 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.124-30 (1982).
Doubly periodic problems of bending of plates with curvilinear holes or elastic inclusions are reduced to systems of Fredholm integral equations of the second kind. An algorithm for determining the stresses and the effective stiffness parameters is given; results of calculations are presented. (11 refs.)

66473 A second order theory for large deflections of slender beams. P.Pleus, M.Sayir (Inst. fur Mech., Swiss Federal Inst. of Technol., Zurich, Switzerland).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.192-217 (March 1983).
The classical theory of finite deformations for slender beams was mainly developed by Euler and Kirchhoff and assumes linear-elastic constitutive behaviour. But finite deformations lead a priori to a problem of nonlinear elasticity. Introducing dimensionless quantities, one realizes the importance of two small parameters which characterize the slenderness of the beam and the relation between the loading and the stiffness of the material. The asymptotic approximation of first order with respect to these two parameters confirm in the case of the 'elastica' the Kirchhoff equations. For the second order approximation the authors restrict the discussion to the case, where the centerline of the beam bends as a plane curve in first order. Under this assumption, they derive general equations of second order and discuss some special cases. They show that local stress and strain fields of second order are always influenced by physical nonlinearities. The importance of the nonlinear effects is illustrated in some numerical examples. (9 refs.)

66474 Minimum-weight thin-walled cylinders of given torsional and flexural rigidity. B.L.Karihaloo, W.S.Hemp.
Report OUEL-1438/82, Univ. Oxford, England (Nov. 1982), 11 pp.
Obtains, in an analytical form, the shape of a doubly symmetrical thin-walled cylinder of constant wall thickness and given contour length that uses the least amount of material in providing prescribed minimum stiffness in torsion and in bending in a principal plane. The shape optimization problem is defined parametrically, and the resulting necessary optimality condition is solved in a closed form.

46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation

(inc. rheology of solids)

66475 Nonlinear statics and dynamics of thin axisymmetric shells by high precision finite elements. W.Borkowski, M.Kleiber (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.1, p.15-37 (1982).
Fundamental equations of the finite element model for an arbitrary axisymmetric thin shell subjected to axisymmetric loadings are studied in the paper. Both different constitutive models (elasticity, elasto-plasticity, creep, elasto-viscoplasticity) and large deformation effects are taken into account. A number of examples illustrate the application of the approach to the numerical nonlinear static and dynamic analysis of shells. (17 refs.)

66476 Interference effect of notches. I. An evaluation of interference effect of notches on yield point load of notched bar with double U-notches by upper and lower bound theorems. T.Majima (Chiba Univ., Chiba, Japan).
Bull. JSME (Japan), vol.26, no.212, p.179-85 (Feb. 1983).
The interference effect of notches on yield point load is analysed by the upper and lower bound theorems for a specimen with double U-notches which is subjected to tensile load under the plane strain and axisymmetrical deformation. The notch pitch range influencing the interference effect on yield point load obtained by theory is in good agreement with that on general yielding load obtained by experiment. The kinematically admissible velocity field with velocity discontinuity and the statically admissible stress field with stress discontinuity employed are proved to be available in predicting the interference effect of notches. These methods of calculating the upper and lower bounds can be applied to the problems of the interference effect of V-notches or cracks. (5 refs.)

66477 Yield design: Norton-Hoff regularization and augmented Lagrangian. T.Guennouni, P.Le Tallec (Lab. Central des Ponts et Chaussees, Paris, France).
J. Mec. Theor. & Appl. (France), vol.2, no.1, p.75-99 (1983). In French.
Describes a kinematical method for yield design which leads to a convenient numerical treatment of three-dimensional bodies and nondifferentiable yielding criterion. The kinematical problem is first regularized through the introduction of the Norton-Hoff viscoplastic fluid associated with yielding criterion, then numerically solved by augmented Lagrangian techniques. Convergence results are derived and numerical examples are presented, including limit load computations of 2-dimensional structures made of truncated Coulomb material or of Camclay, and the computation of the bearing capacity of a square foundation over a purely coherent soil. (24 refs.)

66478 An experimental determination of the fields of strains and stresses in the elastoplastic range. S.Rautu, E.Leibzon (Ben-Gurion Univ., Beer-Sheva, Israel).
Exp. Mech. (USA), vol.23, no.1, p.99-104 (March 1983).
In order to determine the fields of strains and stresses in the elastic and plastic ranges, for the plane-stress problem, a so-called chromorheological (CHR) model has been utilized. On one side of the model the development of plastic deformations, including the elastoplastic boundaries at any stage of loading, can be either visually observed or recorded on film. On the other side of the model, a birefringent coating is attached from which regular experimental data can be obtained. These data, together with the yield condition, render the possibility of finding the state of stresses at all the points of the known elastoplastic boundaries. The problem of stress in the plastic range is statically determinate. The experiment provides all the data on the boun-

daries, and thereby the field of stresses in the plastic range can be calculated. The field of strains in the elastic and plastic zones can be obtained by the well-known method of photoelasticity. In this way, the relationship between stresses and strains in the plastic zones can be worked out. The effectiveness of the approach on a strip with a central hole has been proven by experimental research. (15 refs.)

66479 Plastic bending of laminated sheets for a given change of thickness. A.D.Matveev.
Izv. VUZ Mashinostr. (USSR), no.2, p.6-9 (1983). In Russian.
Discusses the bending of a laminated sheet into a cylindrical shell, whilst preserving the plane of meridional cross-sections, with an unchanging layer in the material volume and size of sheet in direction of the cylindrical axis. For a given change of the sheet thickness, expressions are derived for the motion, rate of deformation, the actual radii between interfacing layers at which the rate of deformation is zero and radii of surfaces with zero deformation. With these parameters of the sheet motion, it is possible to evaluate the stress and the outer moment and forces, satisfying the equation of equilibrium, and depending also on properties of the sheet material; these properties may be assumed to become strain-hardened with deformation. The materials may be isotropic or anisotropic. (no refs.) *Z.F.V.*

66480 Finite plastic deformation of a circular membrane under hydrostatic pressure. I. Rate-independent behaviour. E.Chater, K.W.Neale (Faculte des Sci. Appl., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).
Int. J. Mech. Sci. (GB), vol.25, no.4, p.219-33 (1983).
The large strain behaviour of a circular membrane under uniform hydrostatic pressure is examined for materials with transversely isotropic plastic properties. Time-independent material response is assumed, and both flow theory and deformation theory of plasticity are considered. A variational principle is first applied to derive the governing equations for the pressurized membrane. It is shown that a special solution previously given by Hill (see Phil. Mag., vol.41, ser.7, p.1133, 1950) for isotropic materials can readily be extended to certain transversely isotropic membranes. A finite element solution based on Hill's extremum principle is then developed to study the influence of anisotropy on the finite deformation behaviour of the membrane. Conditions where localized-necking bifurcations become possible are also discussed. (31 refs.)

66481 Finite plastic deformation of a circular membrane under hydrostatic pressure. II. Strain-rate effects. E.Chater, K.W.Neale (Faculte des Sci. Appl., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).
Int. J. Mech. Sci. (GB), vol.25, no.4, p.235-44 (1983).
For pt.I see ibid., vol.25, no.4, p.219 (1983). The combined effects of material strain-rate sensitivity and anisotropy on the large strain behaviour of pressurized circular membranes are examined. Various rate-dependent constitutive laws based on both flow theory and deformation theory of plasticity are considered for materials with transversely isotropic inelastic properties. The numerical analysis is based on the implementation of a finite element scheme for elastic-viscoplastic materials. A criterion assuring numerical stability and convergence is developed and incorporated in the finite element solutions. (11 refs.)

66482 Flexure of an infinite beam embedded in a Vlazov layer. A.P.S.Selvadurai (Dept. of Civil Engng., Carleton Univ., Ottawa, Ontario, Canada).
Int. J. Mech. Sci. (GB), vol.25, no.4, p.245-50 (1983).
Examines the problem related to the flexure of an infinite beam of finite width embedded in bonded contact with a Vlazov-type elastic layer. In such an elastic layer internal displacement constraints are prescribed a priori. The expressions for the deflection, flexural moment, etc. in the infinite beam are presented in integral form. Numerical results are presented for the flexural moment induced in the embedded beam due to the action of a concentrated line load normal to its length. (9 refs.)

66483 Plastic deformation analysis of strain-rate sensitive materials under plane strain conditions. Y.S.Lee, A.T.Male (Res. & Dev. Center, Westinghouse Electric Corp., Pittsburgh, PA, USA).
Int. J. Mech. Sci. (GB), vol.25, no.4, p.251-63 (1983).
The two-dimensional plane strain equation of plastic flow in accordance with the Levy-Mises constitutive relation is expressed in terms of stream function of complex variables. Expressions for the stress, strain-rate and velocity are derived, assuming the stream function in the forms of both the summation and product of conjugate flow functions, for plastic flow in a nonlinear viscous medium. The plastic states are also derived using a mixed mode solution expressed in terms of non-separable, independent conjugate complex variables. Calculations are made on the effect of variation of the strain-rate sensitivity exponent on the development of a specially instrumented plane strain block indentation test for the rapid determination of the strain-rate sensitivity of real materials. By reducing the results of the indentation of a perfectly plastic material it is found that the contact stress is uniform and the external load is constant. (19 refs.)

66484 Dynamic perforation of viscoplastic plates by rigid projectiles. M.Ravid, S.R.Bodner (Faculty of Mech. Engng., Technion Israel Inst. of Technol., Haifa, Israel).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.577-91 (1983).
A model is formulated for the dynamic perforation. The process is considered to occur in 5 continuously coupled but distinct stages which are amenable to analytical treatment. An essential feature of the analysis is the use of postulated, physically motivated, deformation mechanisms in conjunction with the upper bound theorem of plasticity theory which is modified to include dynamic effects. Special attention is given to the bulging process and effects associated with the later stages. This model is self-contained and capable of predicting that exist velocities of the projectile and the plug. It also determines the bulge and plug shape, provides the force-time history of the process, and describes a number of geometrical features of the treatment and final deformation state of the target plate. (12 refs.)

66485 Bifurcations in axially compressed thick elastic-plastic tubes. A.Kumar (Civil Engng. Dept., Indian Inst. of Technol., Kanpur, India), B.B.Niyogi.
Int. J. Eng. Sci. (GB), vol.21, no.6, p.677-80 (1983).
The stress at which first bifurcation takes place in an axially compressed thick elastic-plastic tube is calculated by utilizing the exact formulation developed by A. Kumar and B.B. Niyogi (Int. J. Engng. Sci., vol.21, p.677, 1983) for elastic tubes. Both axisymmetric and asymmetric modes of bifurcation are considered. (8 refs.)

66486 On the relationship between the logarithmic strain rate and the stretching tensor. M.E.Gurtin, K.Spear (Dept. of Math., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.437-44 (1983).
The relationship between the stretching tensor $\mathbf{D}$ and the logarithmic (Hencky) strain $\ln \mathbf{V}$, with $\mathbf{V}$ the left stretch tensor is investigated. The simple formula $\mathbf{D}=(\ln \mathbf{V})^{\circ}-\mathrm{sym}(\mathbf{F}\Omega_r\mathbf{F}^{-1})$, which holds for arbitrary three-dimensional motions is established. Here $\mathbf{F}$ is the deformation gradient, $(\ln \mathbf{V})^{\circ}$ is the time derivative of $\ln \mathbf{V}$ measured in a coordinate system which rotates with the left principal strain axes, and Ω_r is the spin of the right principal strain axes. This formula is used to show that $\mathbf{D}=(\ln \mathbf{V})^{\circ}$, (or, equivalently, $\mathbf{D}=(\ln \mathbf{V})^{*}$, the Jaumann derivative of $\ln \mathbf{V}$), if and only if the characteristic spaces of the right stretch tensor $\mathbf{U}$ are constant on any time interval in which the number of distinct principal stretches is constant. Finally, it is shown that the asymptotic approximation $\mathbf{D}=(\ln \mathbf{V})^{*}+O(\epsilon^3)$ holds whenever the displacement gradient $\mathbf{H}$ satisfies $\mathbf{H}=O(\epsilon),\dot{\mathbf{H}}=O(\epsilon)$. (9 refs.)

66487 Stress state for off-axis tension of perforated materials. A.Litewka, E.Rogalska.
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.285-99 (1981). In Polish.
Determines the elastoplastic stress state in specimens of anisotropic materials loaded in the direction which does not coincide with the symmetry axes of the material structure. The anisotropic material was modelled by means of perforated materials with regular triangular and square penetration patterns. The tests enabled the stress distributions to be determined in characteristic sections of the material structure. The stresses determined were homogenized along the pitch of the hole pattern and the disturbances of the uniaxial stress state for off-axis tension of the specimens were estimated. (11 refs.)

66488 Stressed state of a half-plane reinforced by a beam and stringer, with allowance for the development of plastic deformation. Yu.I.Kudishin.
Mech. Solids (USA), vol.17, no.3, p.116-26 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.131-42 (1982).
In a half-plane whose edge is reinforced by a beam loaded by a transverse concentrated force, at the ends of a stringer perpendicular to the edge, a sharp stress concentration is observed, leading to the appearance of plastic zones. The plasticity problem is solved by the method of elastic solutions of Il'yushin (1948). The corresponding elastic problem is solved by the method of linear conjugacy. Computer calculations are given for two examples: the crane girder of an industrial building and the center girder of a heat and electric power plant, manufactured of construction steels. (14 refs.)

66489 Elastic-plastic bending of beams in the process of motion. M.Ya.Brovman.
Mech. Solids (USA), vol.17, no.3, p.140-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.155-60 (1982).
The problem of elastic-plastic bending of beams that perform translational motion along their axis is considered. Conditions of linear distribution of deformation over the thickness of the beam and the model of an ideal elastic-plastic medium are assumed. Experimental findings are presented. (5 refs.)

66490 Defining equations of creep. K.I.Romanov.
Mech. Solids (USA), vol.17, no.3, p.149-51 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.163-5 (1982).
Equations of nonsteady creep are proposed that link the increments of the deformation and stress rates. These equations make it possible to express the loading history. They can readily be integrated in the case of simple loading. An example of the use of the equations is considered. (3 refs.)

66491 A linear integrodifferential equation for viscoelastic rods and plates. K.B.Hannsgen.
Q. Appl. Math. (USA), vol.41, no.1, p.75-83 (April 1983).
It is proved that the resolvent kernel of a certain integrodifferential equation in Hilbert space is absolutely integrable on (O,∞). The equation arises in the linear theory of isotropic viscoelastic rods and plates. (8 refs.)

46.30L Static buckling and instability

66492 On the buckling and imperfection-sensitivity of arches with and without prestress. J.M.T.Thompson, G.W.Hunt (Dept. of Civil Engng., Imperial Coll. London, London, England).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.445-59 (1983).
Shallow, essentially inextensional, simply-supported arches under central point load are used extensively to illustrate the cusped imperfection-sensitivity of an unstable-symmetric bifurcation. Often these are made in the laboratory by simply buckling a straight strut between fixed abutments, and are therefore prestressed. The authors give a concise buckling and post-buckling analysis of such an arch with any degree of prestress, and show that the critical bifurcation load varies linearly with the prestress. The immediate use of the inextensibility greatly simplifies the analysis and leads to neat closed-form solutions which agree extremely well with the limited theoretical and experimental results available from other sources. (15 refs.)

66493 Reduced stiffness axial load buckling of cylinders. J.G.A.Croll, C.P.Ellinas (Univ. Coll. London, London, England).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.461-77 (1983).
A reduced stiffness method is presented for the estimation of lower bounds to the imperfection sensitive general buckling of axially loaded, orthotropically stiffened, elastic cylinders. It predicts many previously inexplicable empirical observations and provides lower bounds to the scatter of available test buckling loads, thus becoming useful as a design tool. (24 refs.)

66494 Buckling of a thin-walled conical shell for axially-symmetric loads beyond the elastic limit. J.Zielnica, M.Kloiek (Politech. Poznanska, Poznan, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.181-201 (1981). In Polish.
The basic equations are derived, and the critical load evaluation method for an elastic-plastic thin-walled conical shell is presented. It is assumed that the shell is subjected to the following, external, axially symmetric loads: lateral uniform pressure, external uniform hydrostatic pressure, longitudinal compressive force, acting along the shell generatrix. Taking into account Shanley's concept, for each case the relations are given enabling one to find critical loads according to both basic plasticity theories (incremental and total strain). The material's compressibility and linear-type stress-strain characteristic are taken into account. The problem is solved by the orthogonalization method. Numerical results are given in diagrams. (6 refs.)

66495 Buckling and post-buckling behaviour of trapezoidal webplates under compression. R.Gradzki (Politech. Lodzka, Lodz, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.203-15 (1981). In Polish.
The approximate solution of the title problem is derived on the basis of nonlinear differential equations of thin plates with initial deflection. The solution of these equations is based on the Bubnov-Galerkin method. The results of numerical calculations are presented in diagram form. Theoretical results are verified by experiments. 46.30M Vibrations, aeroelasticity, hydroelasticity, mechanical waves, and shocks

(see also 43.40 Mechanical vibrations and shock)

66496 Out-of-plane vibrations of curved bars with varying cross-section. K.Suzuki, T.Kosawada, S.Takahashi (Yamagata Univ., Yonezawa, Japan).
Bull. JSME (Japan), vol.26, no.212, p.268-75 (Feb. 1983).
The out-of-plane free vibrations of a curved bar of which the cross-section varies are analyzed by using the classical theory. The equations of vibration and the boundary conditions are determined from the stationary conditions of the Lagrangian of the bar in a period of vibration. The equations of vibrational are solved exactly in a series solution. As numerical examples, the natural frequencies and the mode shapes of symmetric elliptic arc bars with both clamped ends and with both simply supported ends are obtained. And the variations of the natural frequencies and the mode shapes for various cross-sections are investigated. (13 refs.)

66497 Coupled *P* and *SV* waves propagating in spherical elastic layers. Exact solution and interpretation. A.Gerard (Lab. de Mecanique Theorique, Univ. Pierre et Marie Curie, Paris, France).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.617-25 (1983).
The propagation of coupled P and SV waves emitted by a source point placed outside a given finite set of concentric elastic spherical layers is studied. It is shown that the system of boundary conditions of this pattern is a linear combination of the boundary conditions of the simpler problem of reflection-refraction phenomenon of a wave at a spherical surface. From this result the exact solution follows for all regions of the multilayered structure without using Cramer's technique. This solution is written as a series of which each element is interpreted directly in terms of multiple reflection-refraction. It gives a simple explanation for triggering of resonance phenomena. The solution contains many particular bases of which several are investigated. (17 refs.)

66498 Pade extensions to ray series methods and analysis of transients in inhomogeneous viscoelastic media of hereditary type. D.W.Barclay, T.B.Moodie, R.J.Tait (Dept. of Math., Univ. of Alberta, Edmonton, Alberta, Canada).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.663-73 (1983).
It is demonstrated that wavefront expansions for the analysis of transient phenomena are far from adequate when numerical information back of the wavefront is required. However, by employing Pade approximants together with ray series methods, one can obtain directly and greatly extend the range of validity of these expansions. The procedure, which is straightforward and requires very little computing time, is applied to a non-trivial problem involving impact-generated shear transients in inhomogeneous viscoelastic media whose stress-strain laws are given in integral form. For a special combination of the material parameters an exact solution is recovered and used to check the validity of the approximate Pade-extended wavefront solution. The results from the extended inversion scheme for Laplace solution are also compared with numerical solutions obtained using Bellman's approximate inversion scheme for Laplace transforms. A further advantage of the authors' approach is that, unlike transform techniques, it does not depend upon being able to find tabulated special function equations for the transformed dependent variables. (11 refs.)

66499 Vibrations of cantilevered doubly-curved shallow shells. A.W.Leissa, J.K.Lee, A.J.Wang (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.411-24 (1983).
Vibrational characteristics are determined for a previously unsolved class of problems, that of doubly-curved shallow shells having rectangular planforms, clamped along one edge and free on the other three. The solution procedure uses the Ritz method with algebraic polynomial trial functions. Convergence studies are made, and accurate frequencies and contour plots of mode shapes are presented for various curvature ratios, including spherical, circular cylindrical and hyperbolic paraboloidal shells. Particular emphasis is given to the effect of adding spanwise curvature to shells having chordwise curvature; numerous published references already exist for the case of zero spanwise curvature. The effects of changing aspect ratio, thickness ratio and Poisson's ratio are also studied. (14 refs.)

66500 Simplified equations and solutions for the vibration of orthotropic cyclindrical shells. W.Soedel (School of Mech. Engng., Purdue Univ., West Lafayette, IN, USA).
J. Sound & Vib. (GB), vol.87, no.4, p.555-66 (22 April 1983).
Starting with Love type equations of motion for orthotropic circular cylindrical shells, the theory is simplified by assumptions similar to those in the Donnell-Mushtari-Vlasov development for isotropic shells. Closed form solutions for simply supported cases are then obtained. Results of two example cases are compared with finite element results and are shown to agree well. It is argued that this simplified approach allows easy assessment of the influence of design parameter changes. (14 refs.)

66501 Vibration analysis of Mindlin plates. N.Ganesan (Dept. of Appl. Mech., Indian Inst. of Technol., Madras, India), M.S.Dhotarad.
J. Sound & Vib. (GB), vol.87, no.4, p.643-5 (22 April 1983).
Natural frequencies of flexural vibrations of isotropic plates based on the classical thin plate theory can be in significant error for other than the lower modes of truly thin plates. To account for the effects of transverse shear and rotary inertia, a small number of improved thick plate theories have been developed. One of them is the Mindlin plate theory. The parameters involved in the problem are the deflection w, and the cross sectional rotations ψ_x and ψ_y. In the Rayleigh-Ritz method, trial functions are required for the spatial variation of each of the three quantities w, ψ_x, and ψ_y and these were taken by Dawe and Roufaeil [1980] to be series of products of beam functions. As the functions are little more complicated than classical beam functions it is of some interest to compare results obtained by using the simpler classical beam functions for the solution of the Mindlin plate problem with those obtained by Dawe and Roufaeil. (9 refs.)

66502 Sensitivity of solutions of linear equation for a vibrating membrane to variation of equation coefficients. R.Gutowski (Politech. Warszawska, Warsaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.375-84 (1981). In Polish.
The sensitivity of solution has been tested by the sensitivity function, for which a partial differential equation has been derived. A properly established distance between the null solution to this equation and the solution of the differential equation of sensitivity has been used to estimate the double integral of the square of the sensitivity function. The estimation service later to investigate the variation with time of the double integral and permitted one to determine its limitations and convergence to zero as $t \rightarrow \infty$. (6 refs.)

66503 Transverse vibrations of a beam forced by discrete material system. S.Kasprzyk, R.Ziernicki (Politech. Karkowska, Krakow, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.423-33 (1981). In Polish.
A mathematical model is developed for the analysis of the dynamic response of a beam on which a discrete system moves with constant velocity. (6 refs.)

66504 Hamilton's law applied to the nonstationary elastodynamics of plates. C.D.Bailey (Dept. of Aeronaut. & Astronaut. Engng., Ohio State Univ., Columbus, OH, USA).
Mech. Res. Commun. (GB), vol.9, no.6, p.381-9 (Nov.-Dec. 1982). [received: March 1983]
Hamilton's law of varying action is applied to obtain direct analytical solutions to the non-stationary, non-conservative and conservative motion of plates with prescribed initial conditions. Analytical solutions are generated directly from the law of varying action without any use of or reference to the theory of differential or integral equations. Calculated results are compared to experimental results for two separate sets of initial conditions. (21 refs.)

66505 Waves in weakly anisotropic media. Yu.A.Rossikhin.
Mech. Solids (USA), vol.17, no.3, p.146-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.160-2 (1982).
An anisotropic medium is considered whose elastic moduli differ only slightly from the elastic coefficients of some isotropic material. A medium of this type is called weakly anisotropic. In this medium the behavior of body waves that arise when a load is suddenly applied to the boundary of a spherical cavity is investigated. The perturbation method is employed which enables one to obtain in a first approximation a number of features of wave propagation in crystals. (4 refs.)

66506 Experimental study of the behavior of perforated plates under static and dynamic loads. I.N.Preobrazhenskii, E.D.Skurlatov.
Mech. Solids (USA), vol.17, no.3, p.155-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.168-71 (1982).
Presents the findings of an experimental study of the behavior of circular perforated plates under the action of a static load or load of shock-wave type applied to the lateral surface. The plates were made both of plastic compounds of type AMG-6 and of brittle materials such as polymethyl methacrylate, celluloid, and beryllium. Analysis of test results yielded empirical relationships that simplify the calculation of the static breaking load and that also permit an evaluation of the dynamic response of perforated plates acted upon by shock waves. Aspects of the behavior of brittle and plastic plates in collision with solid particles moving at velocities 100-2500 m/sec are discussed, as well as aspects of the behavior of particle-damaged plates under subsequent static and dynamic loading. (4 refs.)

66507 Density of free vibration frequencies for a thin anisotropic shell made of anisotropic layers. G.R.Gulgazaryan, V.B.Lidskii.
Mech. Solids (USA), vol.17, no.3, p.159-62 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.171-4 (1982).
The density of free vibration frequencies is found for a thin shell of arbitrary outline, made up of anisotropic shells. (11 refs.)

46.30N Fracture mechanics, fatigue, and cracks

66508 Interaction of cracks in elastic media. M.Matczynski, M.Sokolowski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.1, p.89-104 (1982).
The problem of static interaction of cracks in elastic bodies is considered from the point of view of the classical fracture analysis, and of the general theory of defects in solids. Effective formulae for the interaction forces are derived by means of the path-independent integrals. The results are illustrated by examples of approximate analysis of the problem of an infinite elastic body containing two parallel cracks and subject to antiplane strain. (12 refs.)

66509 Axisymmetric problem of a flat interface annular crack between an elastic layer and a half-space. K.Kaneko (Yanagicho Works, Toshiba Corp., Kawasaki, Japan), Y.Shindo, A.Atsumi.
Bull. JSME (Japan), vol.26, no.212, p.202-6 (Feb. 1983).
The singular stress problem for an elastic layer bonded to a half-space with different material properties is considered. It is assumed that the bimaterial interface contains a flat annular crack of which the surfaces are subjected to known tractions. The axisymmetric elastostatic problem is first reduced to

that of solving a system of singular integral equations of the second kind. By the way of expanding the unknown function into Jacobi polynomials, the singular integral equations are further reduced to the infinite system of linear algebraic equations for determining the unknown coefficients. Numerical examples are given for an aluminum-epoxy and an aluminum-steel material combination. The stress-intensity factor with the ratio of the inner radius to the outer one of the crack is shown graphically for several values of layer thickness. (7 refs.)

66510 Some remarks on elastic fracture mechanics. P.Destuynder (Div. Mecanique Theorique et Calcul des Structures. EDF, DER, Clamart, France), M.Djaoua, S.Lescure.
J. Mec. Theor. & Appl. (France), vol.2, no.1, p.113-35 (1983). In French.
A thermodynamical approach to the propagation law in elastic media is given. From a particular choice of an energy dissipation potential, some propagation laws are deduced corresponding to particular loading cases. Finally a new computational method for the energy release rate is suggested and discussed from a computational point of view. (25 refs.)

66511 Dynamic crack curving—a photoelastic evaluation. M.Ramulu, A.S.Kobayashi (Dept. of Mech. Engng., Univ. of Washington, Seattle, WA, USA).
Exp. Mech. (USA), vol.23, no.1, p.1-9 (March 1983).
A dynamic-crack-curving criterion, which is valid under pure Mode I or combined Modes I and II loadings and which is based on either the maximum circumferential stress or minimum strain-energy-density factor at a reference distance of r_o from the crack tip, is verified with dynamic-photoelastic experiments. Directional stability of a Mode I crack propagation is attained when $r_0=1/128\pi[(K_I/\sigma_{0x})^2V_0^2(C,C_1,C_2)]>r_c$, where $r_c=1.3$ mm for Homalite-100 used in the dynamic-photoelastic experiments. (34 refs.)

66512 Displacement measurements around cracks in three-dimensional problems by a hybrid experimental technique. C.W.Smith, D.Post, G.Hiatt, G.Nicoletto (Dept. of Engng. Sci. & Mech., Virginia Polytech. & State Univ., Blacksburg, VA, USA).
Exp. Mech. (USA), vol.23, no.1, p.15-20 (March 1983).
Diffraction gratings were applied to slices taken from three-dimensional stress-frozen models of bodies with cracks. The slices were then annealed to relax the reversible strains and moire interferometry was used to determine the deformation of the slice. A virtual reference grating of 1200 *l*/mm (30000 *l*/in) was used to provide the required high sensitivity. The moire pattern in the LEFM (linear-elastic fracture-mechanics) zone was photographed with 20x magnification. Results were compared with those obtained photoelastically. (17 refs.)

66513 Internal energy dissipation in metals subjected to cyclic stresses with varying amplitudes. A.N.Artamonov, D.N.Reshetov, R.M.Chatynyan.
Izv. VUZ Mashinostr. (USSR), no.2, p.12-15 (1983). In Russian.
Describes a procedure for investigating rules of build-up of fatigue faults by a method of continuous recording of the deformation of a sample. Experimental results are presented in the form of graphs of the energy dissipated during a cycle, as a function of the loading cycles, for fixed and mean equiprobable loading conditions. Tests with identical samples were performed in a quantity adequate for statistical processing of the data. (9 refs.) *Z.F.V.*

66514 The onset of fracture at the tip of a three-dimensional crack in a solid subjected to bending loads. E.Smith (Dept. of Metall., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.627-33 (1983).
The conditions for the extension of a 3-dimensional crack in a solid subjected to bending loads are examined for the case where the ligament has fully yielded. The main conclusion, for this 3-dimensional problem, is that caution should be exercised when applying the well-known J integral relation: $J=(\partial M_p/\partial A)\phi_p$ where M_p is the plastic limit moment and ϕ_p is the plastic rotation. (4 refs.)

66515 Three-dimensional curved crack in an elastic body. V.Sladek, J.Sladek (Inst. of Construction & Architecture, Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Int. J. Solids & Struct. (GB), vol.19, no.5, p.425-36 (1983).
The boundary integral equations, which give the relation between the crack opening displacement and traction on the surface of a crack embedded in an infinite isotropic elastic body are formulated. The integral equations are transformed into spherical and cylindrical coordinates in the cases of cracks curved in the shape of spherical and cylindrical surfaces respectively, so that these boundary integral equations may be converted into a system of algebraic equations by the boundary element method. The dependence of stress-intensity factors on the curvature of crack has been numerically calculated for the spherical crack with circular contour under a constant load. (12 refs.)

66516 Elastic analysis of torsion crack problems of a bar with ring segment sections. Chen Yi-Zhou (Div. of Solid Mech., North-Western Polytech. Univ., Xian, China), Chen Yi-Heng.
Int. J. Fract. (Netherlands), vol.22, no.1, p.3-14 (May 1983).
Torsion crack problems of a bar with ring segment sections are discussed. The procedure utilized consists of the following three steps: (1) using the conformal mapping technique, (2) using the harmonic function continuation technique, (3) using the compliance method. The procedure used belongs to an indirect one with respect to calculation of K_3 values. All the numerical results concerning the torsional rigidity and K_3 are given. (11 refs.)

66517 Comparison of finite element solutions with analytical and experimental data for elastic-plastic cracked problems. M.H.Bleackley, A.R.Luxmoore (Dept. of Civil Engng., Univ. Coll. of Swansea, Swansea, Wales).
Int. J. Fract. (Netherlands), vol.22, no.1, p.15-39 (May 1983).
Nonlinear finite element results from a round robin are compared with empirical and experimental data obtained for three types of geometries: compact specimen, three-point bend specimen and a center-cracked panel subject to uniaxial loading. The solution parameters to be compared in various forms are: applied load, clip gauge displacement, Rice J-integral (with no limit placed on method of calculation), K_I, crack opening profiles and plastic zone development. (15 refs.)

66518 Energy release rate techniques for combined thermo-mechanical loading. B.R.Bass, J.W.Bryson (Heavy-Section Steel Technol. Program, Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Int. J. Fract. (Netherlands), vol.22, no.1, p.R3-7 (May 1983).
Nonlinear methods in computational fracture mechanics have focused increasingly on energy release rate techniques for computing stress intensity parameters of crack configurations. The technique of deLorenzi (1980) has been applied in the heavy-section steel technology (HSST) program to 3-D linear elastic and elastic-plastic models of plates and cylinders containing straight-through and curved finite crack configurations. For brevity, only the essential alterations to deLorenzi's argument are treated here. (7 refs.)

66519 Effect of non-uniform pressure on the extension of an external crack. M.Maiti, R.Paramguru (Dept. of Math., Indian Inst. of Technol., Kharagpur, India).
Int. J. Fract. (Netherlands), vol.22, no.1, p.R15-19 (May 1983).
Considers non-uniform loading condition over the surface of an external crack and thereby determine the effect of such loading on the extension of an external crack. (9 refs.)

66520 The inclined crack under biaxial and uniaxial loading. P.S.Theocaris, A.C.Chrysakis (Dept. of Theoretical & Appl. Mech., Athens Nat. Tech. Univ., Athens, Greece).
Int. J. Fract. (Netherlands), vol.22, no.1, p.R25-9 (May 1983).
It has been observed that for an inclined crack under biaxial loading at infinity (σ_1, k, β) the coefficient of its singular solution, known as the stress intensity factor and being a complex number, can be expressed by means of two real parameters. As such the authors choose the stress at infinity σ and the inclination α of a uniaxially loaded inclined crack, thus establishing an equivalence between the two configurations. This equivalence is shown to fail for those combinations of k and β corresponding to the case of mode II deformation. (7 refs.)

66521 Plane-normal separation crack for the case of linear linkages between its surfaces. E.I.Shifrin.
Mech. Solids (USA), vol.17, no.3, p.70-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.80-6 (1982).
Considers a plane crack in an elastic space. It is assumed that normal opening forces that are symmetrical relative to the plane of the crack are applied to the crack surfaces, and that there are linkages between the surfaces. It is further assumed that the effect of the linkages can be taken into account by normal forces that close the crack and are proportional to the aperture. An example can be provided by a material with a crack whose surface is intersected by a large number of elastic reinforcing elements of small dimensions. In this case the forces that close the crack arise as a result of adhesion between the material and the reinforcing elements. A comparison theorem is proved with respect to the parameter characterizing the linkages. By means of these assertions, estimates are obtained for the stress intensity coefficients under uniform loads in terms of the geometrical characteristics of the crack region. Estimates for the crack volume are given that are analogous to those obtained in the problem without linkages. A numerical solution is provided for the problem of a penny-shaped crack under uniform loads and for various characteristics of the linkages. (8 refs.)

66522 Dynamic fracture mechanics. R.S.J.Corran.
Report OUEL-1421/82, Univ. Oxford, England (July 1982), 70 pp.
The elastic analysis of the dynamic crack is presented, including the crack tip stress field, the energy flux into the crack tip, the energy balance criterion, and the problem of crack arrest. Techniques for measuring initiation toughness are reviewed, including notched bar tests, small CTS (compact tension specimen) testing, and the notched cylinder test. Crack arrest testing is discussed including dynamic analysis of a double cantilevered beam specimen. (41 refs.)

46.30P Friction, wear, adherence, hardness, mechanical contacts

66523 Explicit equations for the stresses beneath a sliding spherical contact. G.M.Hamilton (Dept. of Engng., Univ. of Reading, Reading, England).
Proc. Inst. Mech. Eng. Part C (GB), vol.197, p.53-9 (March 1983).
Explicit formulae are developed for the stresses beneath a sliding, normally loaded Hertzian contact. As friction rises a region of impending failure develops in the back edge of contact. (11 refs.)

66524 A slip-line field analysis of the rolling contact problem at high loads. H.Petryk (Inst. of Fundamental Technol. Res., Acad. of Sci., Warsaw, Poland).
Int. J. Mech. Sci. (GB), vol.25, no.4, p.265-75 (1983).
An analysis of the steady rolling of a rough rigid cylinder over the surface of a rigid-perfectly plastic solid is presented. An exact slip-line field solution is investigated by using some recently developed techniques. It is shown that the solution is not uniquely defined and infinitely many complete solutions can be constructed for given boundary conditions. The numerical results show interesting variations of the deformation pattern and of rolling resistance at high loads. The limits are predicted to the magnitudes of the applied load and braking torque for which the steady rolling is possible. (22 refs.)

66525 Contact between an elastically supported circular plate and a rigid indenter. L.M.Keer, G.R.Miller (Northwestern Univ., Technol. Inst., Evanston, IL, USA).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.681-90 (1983).
The axially symmetric problem of a finite circular plate loaded at its center by a smooth, rigid punch is solved by superposing an infinite layer elasticity solution with a pure bending plate theory solution. The problem is reduced to dual integral equations, which are further reduced to a single Fredholm integral equation of the second kind. The Fredholm equation is numerically solved and the results are used to compute contact stresses under the indenter as well as the overall load-deflection behavior. The problem is formulated to model a partially fixed edge around the plate's perimeter, and calculations are carried out for the limiting cases of simple supports and complete fixity. Various ratios of plate diameter to plate thickness are studied, and the results are compared to both Hertzian contact theory and standard plate theory. (5 refs.)

66526 Nature of substructural hardening. N.A.Koneva, E.V.Kozlov (Civil-Engng. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.681-91 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.3-14 (Aug. 1982). [received: April 1983]
This is a reworked version of a review paper that the authors presented at the first conference on substructural hardening (mechanical-thermal working and Substructural Hardening of Metals Conference, Kiev, May 19-21, 1981), and contains a classification of substructures, important characteristics of mechanisms for its formation, and an estimate of the role of the component substructures in the formation of flow stress. The experimental facts, on which the concepts presented are based, are taken from work that they have performed with co-workers. The materials used for the investigations were austenitic

manganese steel, disordered and ordered nickel and palladium-iron and copper-gold alloys. Thus, the problems examined in this paper and the results obtained are limited to FCC materials. (27 refs.)

46.30R Measurement methods and techniques

(see also 07.10 Mechanical instruments and techniques, 81.70 Materials testing)

66527 Optical heterodyne measurement of vibration phase. Y.Oshida, K.Iwata, R.Nagata (Dept. of Mech. Engng., Univ. of Osaka Prefecture, Osaka, Japan).
Opt. & Lasers Eng. (GB), vol.4, no.2, p.67-79 (1983).
An optical heterodyne system for measuring a vibration phase, which uses a frequency-shifted and phase-modulated reference beam, is proposed. This system is applicable to a rough surface. By using the light scattered by a standard vibrating point on the object surface as the reference beam (local reference beam technique), effects of the uniform displacement of the object can be eliminated, i.e. only the vibration component is detected with no sensitivity to the uniform displacement. Preliminary experiments demonstrate the validity of the theory. (7 refs.)

66528 Interferometric analysis for small rotation. Jacob Wen-Kuang Huang, Song Yu-Dong (Phys. Dept., Towson State Univ., Baltimore, MD, USA).
Opt. & Lasers Eng. (GB), vol.4, no.2, p.81-90 (1983).
Both holographic interferometry and speckle interferometry are used to analyse small rotation. The experimental set-up and results are presented. A brief comparison of the two methods is also given. (4 refs.)

66529 Experimental study of inelastic strain patterns in a model of a tube-plate ligament using an interferometric moire technique. C.A.Walker, J.McKelvie, A.McDonach (Centre for Industrial Innovation, Univ. of Strathclyde, Glasgow, Scotland).
Exp. Mech. (USA), vol.23, no.1, p.21-9 (March 1983).
A sensitive moire interferometer has been developed for measuring elastoplastic strain distributions. No rigid connection with the specimen was required, and the fringe patterns could be seen by eye as loading progressed. The system has been applied to the measurement of strain patterns in a stainless-steel model of a tube-plate ligament. The model was loaded in tension and in bending, with the eventual aim of measuring strain-intensification factors which could be used as basic design data. (8 refs.)

66530 Epon 828 epoxy: a new photoelastic-model material. R.B.Agarwal, L.W.Teufel (Dept. of Mech. Engng., San Jose State Univ., San Jose, CA, USA).
Exp. Mech. (USA), vol.23, no.1, p.30-5 (March 1983).
The photoelastic properties of Epon 828 are discussed. The epoxy is evaluated experimentally for its time-edge effect, optical creep, stress-optic relations, and mechanical properties at room and elevated temperatures. Epon 828 is extremely clear, has good transparency, and can be used for photoelastic stress analysis at room and elevated temperatures. It has a low-fringe constant at room temperature as will as at elevated temperatures coupled with a high critical modulus of elasticity. Epon 828 can easily be cast stress-free and has relatively small amounts of optical and mechanical creep. The machining characteristics of Epon 828 are excellent and it cements easily with itself and other epoxy materials. (6 refs.)

66531 An introduction to dynamic photoelasticity. Discussion. J.A.Clark, A.J.Durelli (Dept. of Mech. Engng., Catholic Univ. of America, Washington, DC, USA).
Exp. Mech. (USA), vol.23, no.1, p.42-8 (March 1983).
J.W. Dally's review of several systems for recording photoelastic fringe patterns which change rapidly in time identifies many of the challenges and recent successes of one active research area in dynamic photomechanics. His presentation also outlines techniques for determining stresses from photographs of dynamic fringe patterns in a few particular cases, indicates some successful applications of photoelastic methods and addresses the difficult problem of categorizing elastodynamic phenomena in a manner most relevant to researchers in photoelasticity. However, the discussers feel that this article, if intended as an introduction to the entire field of dynamic photoelasticity, would benefit from a broader view of the subject. The authors offer the following comments in the spirit of complementing the original article with discussions of several other aspects of dynamic photoelasticity which the authors feel are at least equally important. Ambiguities in this article such as the confusion between edge waves on a thin plate and Rayleigh waves require that the discussion starts with a presentation of some fundamental concepts concerning the distinction between waves propagating in large bodies (extended media) and waves propagating in plates (bounded media). (22 refs.)

66532 On stress analysis of anisotropic composites through transmission optical patterns: isochromatics and isopachics. K.A.Jacob, V.Dayal, B.Ranganayakamma (Structures & Materials Div., Aeronautical Dev. Establ., J.B. Nagar, Bangalore, India).
Exp. Mech. (USA), vol.23, no.1, p.49-54 (March 1983).
A real-time holographic interferometry technique is suggested for recording the isopachic patterns corresponding to transparent anisotropic composites. The isochromatic and isopachic patterns are obtained for a transparent glass-epoxy composite disk with a central hole subjected to diametral compression. A method is suggested for interpreting the optical data and to obtain the separate values of stress components. Its application is demonstrated. (14 refs.)

66533 A method of three-dimensional strain measurement on non-ideal objects using holographic interferometry. J.L.Goldberg (CSIRO Div. of Appl. Phys., Sydney, Australia).
Exp. Mech. (USA), vol.23, no.1, p.59-73 (March 1983).
Holographic interferometry has been applied to determine the components of tensile, compressive and shear strain in the surface layer of a non-ideal object subjected to high values of stress. The method consists of determining the three components of the vector displacement at a sufficient number of discrete points on the surface of the object. Functions in the form of truncated power series are fitted to the fringe order-distance data using the method of least squares. Interpolation of these functions is then carried out to obtain the fringe-order numbers at closely spaced equal intervals. The displacement in each interval is calculated and the displacement-distance relationship is then numerically differentiated to obtain strain. Components of stress at a particular point are then estimated by multiplying the strain value by the appropriate modulus. (12 refs.)

66534 Experimental technique for measurement of stress-acoustic coefficients of Rayleigh waves. K.Jassby (Faculty of Engng., Tel-Aviv Univ., Tel-Aviv, Israel), D.Kishoni.
Exp. Mech. (USA), vol.23, no.1, p.74-80 (March 1983).
Two stress-acoustic coefficients, K_1 and K_2, are required to determine the state of biaxial surface stress from ultrasonic Rayleigh-wave velocity of time of flight measurements in elastic, initially isotropic solids. An experimental technique is described for the precise measurement of these two coefficients in uniaxially stressed test specimens. The technique is applied to aluminum 2024-T351 and 6061-T651 alloys. The influence on measurement results of various parameters such as material anisotropy and temperature is considered. (14 refs.)

66535 In-plane shear test of thin panels. G.L.Farley, D.J.Baker (US Army Res. & Tech. Labs., Langley Res. Center, Hampton, VA, USA).
Exp. Mech. (USA), vol.23, no.1, p.81-8 (March 1983).
Efficient application of thin-gage composite materials to helicopter fuselage structures necessitates that the materials be designed to operate at loads several times higher than initial buckling load. Methods are required to accurately measure and predict the response of thin-gage composites when subjected to these loads. This paper presents the results of an analytical and experimental study of the behavior of thin-gage composite panels subjected to in-plane shear loads. Finite-element stress analyses were used to aid in the design of an improved shear fixture that minimizes adverse corner stresses and tearing and crimping failure-modes characteristic of commonly used shear fixtures. Tests of thick buckle-resistant aluminum panels and thin aluminum and composite panels were conducted to verify the fixture design. Results of finite-element stress and buckling analyses and diagonal-tension-theory predictions are presented. Correlation of experimental data with analysis indicated that diagonal-tension theory can be used to predict the load-strain response of thin composite panels. (5 refs.)

66536 Transient response of a central crack to a tensile pulse. A.A.Sukere, W.N.Sharpe,Jr. (Dept. of Mech. & Aerospace Engng., Univ. of Missouri-Columbia, Independence, MO, USA).
Exp. Mech. (USA), vol.23, no.1, p.89-98 (March 1983).
Studies the opening displacement of a central electromachined slot in a thin aluminum plate subjected to an elastic tensile pulse. The tensile pulse was generated by an impact apparatus, and in-plane displacements were measured by interferometric techniques. Comparison with existing analytical and finite solutions was good for short times. (27 refs.)

66537 Identification of isochromatic fringes. A.J.Durelli, A.Shukla (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA).
Exp. Mech. (USA), vol.23, no.1, p.111-19 (March 1983).
In simple cases of static-photoelastic analysis, the numbering or the isochromatic fringes does not present unusual difficulties. In more complex cases, in particular wave propagation, the problem may be so difficult that few investigators attempt the analysis. The authors present guidelines to number the isochromatic fringes. Advantage is taken of some topological properties as well as of the time and space derivatives of these isochromatic fringes. Several examples are discussed to illustrate the use of the guidelines. It is observed that under most conditions the guidelines are sufficient to number the whole field of isochromatics on photographs taken with the commonly used monochromatic light. (10 refs.)

66538 Nondestructive residual-stress measurement in a wide-flanged rolled beam by acoustoelasticity. H.Fukuoka, H.Toda, H.Naka (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Exp. Mech. (USA), vol.23, no.1, p.120-8 (March 1983).
Acoustoelasticity makes use of stress-induced acoustic-birefringent effects. It gives stress distributions averaged through the thickness of a specimen. This technique is attractive because it does not require a transparent plastic model as photoelasticity does. However, much should be done before this method is established as a standard nondestructive technique of stress analysis. The most important among them is to separate stress-induced birefringence from that introduced by texture structure. For special cases, such as axisymmetric stress distributions and when a stress-free region is known a priori, residual-stress distributions can be evaluated nondestructively. In this paper, the authors measured residual-stress distribution in a wide-flanged rolled beam by using a recently developed T-type transducer. The results were compared to those obtained from conventional destructive methods. (3 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

66539 Analysis of the Rouse model in extensional flow. I. A general solution of the distribution function in an arbitrary flow field. D.H.King, D.F.James (Dept. of Mech. Engng., Univ. of Toronto, Toronto, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.7, p.4743-8 (1 April 1983).
The statistical mechanics of the Rouse model for a macromolecule are analyzed by the use of Laplace transform techniques. The analysis leads to the known constitutive equation for a dilute solution of Rouse-type molecules and to the general solution for the distribution function ψ in an arbitrary flow field. The form of the general solution is different from that presented by Lodge and Wu (1971) and appears to be easier to use. In particular, the new solution makes it straightforward to calculate average molecular quantities like deformation because there is a simple relation between the quantity and the Laplace transform of ψ. This capability is shown by calculations of molecular size, shape, and elastic storage for a general flow field. The deformation of a submolecule unit is also calculated for an assessment of the validity of the Rouse model. The assessment shows that the model is valid per se even at high rates of pure extension. (8 refs.)

66540 Analysis of the Rouse model in extensional flow. II. Stresses generated in sink flow by flexible macromolecules and by finitely extended macromolecules. D.H.King, D.F.James (Dept. of Mech. Engng., Univ. of Toronto, Toronto, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.7, p.4749-54 (1 April 1983).
For pt.I see ibid., vol.78, no.7, p.4743 (1983). Stresses generated by a solution of Rouse macromolecules in planar and axisymmetric sink flow were analyzed by solving the momentum equation together with the constitutive relation corresponding to the Rouse model (i.e., the generalized converted Maxwell equation). The results show that the additional normal stress in the radial direction is of order $[\eta]c$ when compared with the corresponding Newtonian viscous stress. However, in the high Reynolds number range where sink flow conditions are valid, the additional stress must be compared with inertial stresses, and in that case the results show that the ratio of non-Newtonian to Newtonian hydrodynamic stresses is of order $[\eta]c/\mathrm{Re}$, where Re is the Reynolds number. Since experimental data exceed this small ratio by two orders of magnitude, a new molecular model was developed to accommodate limited molecular extension. The model presumes that, in a converging flow, a molecule initially deforms as a Rouse molecule and then its configuration is frozen after a certain amount of extension. This 'frozen-necklace' model consequently provides an estimate of hydrodynamic effects caused by finite extension, as might be created by intramolecular entanglements. Non-Newtonian stresses predicted by the model are compared with available data for strictly dilute solutions and agree to the same order of magnitude. (14 refs.)

66541 Binary blends of monodisperse polymers: use of a kinetic network model for nonlinear shear stress predictions in entangled polymer fluids. T.Y.Liu, D.S.Soong, M.C.Williams (Dept. of Chem. Engng., Univ. of California, Berkeley, Berkeley, CA, USA).
J. Rheol. (USA), vol.27, no.1, p.7-35 (Feb. 1983).
A molecular network theory incorporating the concept of entanglement disruption and regeneration was previously developed (1981) to describe not only steady-state but also transient rheological properties of monodisperse polymer melts and concentrated solutions. The viscoelastic responses of these systems are dominated by a rapid segmental motion at short times and a more sluggish, structure-dependent network relaxation process at long times. In a binary blend of monodisperse fractions, the entangled network is composed of chains of two different lengths. The chain dynamics, and thus the characteristic response time, of each component in such a system is influenced by the presence of the coexistent component. This interaction is accommodated by a simple mixing assumption, which leads to accurate predictions of composition-dependent linear viscoelastic properties, such as zero-shear viscosity. In addition, the model gives an excellent description of the shear-rate-dependent viscosity curves of binary blends of various compositions and concentrations. (35 refs.)

66542 Shear fracture in cone-plate rheometry. R.I.Tanner, M.Keentok (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia).
J. Rheol. (USA), vol.27, no.1, p.47-57 (Feb. 1983).
When subject to moderate shear rates in a cone-plate and parallel plate rheometer, viscoelastic samples tend to fracture at the edge of the sample thus preventing the measurement of viscosity and normal stresses at high shear rates. An explanation of this behavior has been given in terms of a critical elastic strain energy by Hutton and the authors offer an alternative explanation based on fracture mechanics. It is shown that fracture occurs if $|N_2| > \Gamma/3a$, where N_2 is the second normal stress difference, Γ is the surface tension coefficient, and a is the size of the fracture. The experimental data show that this equation correctly predicts the occurrence of shear fracture and also the shear rate at which it occurs. At high shear rates, Newtonian liquids and some viscoelastic liquids are ejected from the cone-plate and parallel plate rheometer due to the effect of centrifugal forces. (10 refs.)

66543 Effect of shear degradation on the rheological properties of dilute drag-reducing polymer solutions. Hsun-Fu David Chang, R.Darby (Dept. of Chem. Engng., Texas A&M Univ., College Station, TX, USA).
J. Rheol. (USA), vol.27, no.1, p.77-88 (Feb. 1983).
Apparent viscosity over a range of 10^6 s^{-1} in shear rate and first normal stress difference functions for dilute drag-reducing solutions of Separan AP-30 in distilled water were measured for both freshly prepared and shear-degraded solutions, for concentrations from 100 to 500 wppm. A nonlinear integral constitutive equation is proposed which accurately represents these data, and the effects of concentration and shear degradation on the properties (e.g., the model parameters) is shown. Shearing has a greater effect on the low shear viscosity of these solutions than it has on the elastic properties, resulting in a greater degree of drag reduction for the sheared than the fresh solutions. (21 refs.)

66544 Unusual rheology of a branched, water-soluble chitosan derivative. M.Yalpani (Dept., of Pathology, Univ. of British Columbia, Vancouver, British Columbia, Canada), L.D.Hall, M.A.Tung, D.Brooks.
Nature (GB), vol.302, no.5911, p.812-14 (28 April 1983).
Reports some unusual non-Newtonian features of 1-deoxylactit-1-yl chitosan, which displays low-shear Newtonian behaviour, a medium-shear viscosity increase (dilatancy), and a high-shear viscosity drop (pseudoplasticity). In conditions of steady shear the shear stress-time function varies in the different shear rate regimes. A 2% solution of this derivative exhibits unique oscillatory behaviour under steady shear at the transition point between the dilatant and pseudoplastic regimes. (15 refs.)

46.90 OTHER TOPICS IN MECHANICS, ELASTICITY, AND RHEOLOGY

66545 Mathematical models of the methods for calculations of shape and tensile forces in moving thread systems. W.Hackmann (Wilhelm-Pieck-Univ. Rostock, Rostock, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.3, p.173-84 (1983). In German.
Evaluates shape and tensile forces in systems of threads uniformly moving in a viscous fluid. Two kinds of mathematical models are described. Model 1 uses a system of ordinary differential equations of the first order for shape and tensile force. Model 2 uses a system of integral equations for the tensile force. Further there are stated sufficient conditions to solve model 2 by means of successive approximations. After discretization of model 2 by the centered Euler scheme (or box scheme) one can use the method of successive approximation to the discretized system under similar sufficient conditions. Error bounds of type $O(h^2)$ are stated for the solutions of the discretized system belonging to model 2. At last results are deduced for the applicability of Newton's method to the discretized system. (9 refs.)

47.10 GENERAL THEORY

(see also 03.40G Mathematical aspects)

66546 Finite elements and characteristics applied to advection-diffusion equations. Y.Hasbani, E.Livne, M.Bercovier (Inst. of Math., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
Comput. & Fluids (GB), vol.11, no.2, p.71-83 (1983).
Deals with an algorithm for the solution of advection-diffusion equations based on the finite element method combined with the discretization of the total differential $D\rho/Dt$. The authors give in the one dimensional case the finite difference analog of the Galerkin method. Diffusion of the scheme is studied in the two dimensional case by means of a classic example. They show that the scheme is stable, has no phase error and leads to simple problems at each time step. The authors extend the study to a simple 2D transport problem in rotating flow. (12 refs.)

66547 Progress in computational physics. E.Turkel (School of Math., Tel-Aviv Univ., Tel-Aviv, Israel).
Comput. & Fluids (GB), vol.11, no.2, p.121-44 (1983).
Recent progress in computational methods for time dependent fluid dynamics is presented. The emphasis is on advances applicable to large scale systems with the connection between the numerics and the physics of the code stressed. All aspects of a working code are discussed including such topics as initialization, boundary conditions, grid generation in addition to algorithmic advances. One sometimes uses a time dependent method as an iteration procedure to reach a steady state solution. Work in accelerating the convergence to the steady state is also surveyed. (307 refs.)

66548 Solutions of the Navier-Stokes equations by group methods. R.E.Boisvert (School of Math., Georgia Inst. of Technol., Atlanta, GA, USA), W.F.Ames, U.N.Srivastava.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.31-5 vol.3
Using the machinery of Lie theory (groups and algebras) applied to the Navier-Stokes equations a number of exact solutions for the steady state are derived in (two) three dimensionals. It is then shown how each of these generates an infinite number of time dependent solutions via (three) four arbitrary functions of time. This algebraic structure also provides the mechanism to search from other solutions since its character is inferred from the basic equations. (9 refs.)

47.15 LAMINAR FLOWS

66549 Stream function formulation of the 2-D Stokes problem in a multiply-connected domain. F.Crowet, C.Dierieck (Philips Res. Lab., Bruxelles, Belgium).
J. Mec. Theor. & Appl. (France), vol.2, no.1, p.67-74 (1983).
Deals with the problem of characterizing the stream function associated with a velocity field, described by a 2-*D* Stokes problem (i.e. viscous incompressible plane flow). As is well known, such a problem amounts to solving a biharmonic equation. Attention is focused on the determination of the exact boundary conditions, especially in a multiply-connected domain. In particular for the stream function formulation of a 2-*D* Stokes problem with homogeneous boundary conditions, it is possible to calculate explicitly the

constants which the stream function should attain on each connected component of the boundary. (7 refs.)

66550 Mass transfer between a suspension of fibres and a rotating disk. D.Huin, G.Cognet (Lab. d'Energetique et de Mecanique Theorique et Appliquee, Nancy, France).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.1-12 (Jan.-Feb. 1983). In French.
Considers the laminar flow of a suspension of fibres generated by a rotating disk. Addition of fibres increases noticeably the mass transfer at the disk surface meanwhile the skin friction seems not to be really modified by their presence. (5 refs.)

66551 Steady viscous flows by compact differences in boundary-fitted coordinates. X.Aubert, M.Deville (Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
J. Comput. Phys. (USA), vol.49, no.3, p.490-522 (March 1983).
Fourth-order compact differencing is applied to the steady solution of two-dimensional viscous incompressible flows at moderate Reynolds number. The physical region where the fluid flow occurs is mapped onto a rectangle by means of the boundary-fitted coordinates transformation method. The design of the general numerical algorithm rests upon discretization of velocity components and pressure field at the same grid points. The validity of this procedure is assessed by the investigation of a Stokes test problem. Fourth-order numerical results are compared the analytical solution, second-order results and Chebyshev tau approximation. (28 refs.)

47.15C Laminar boundary layers

66552 Laminar compressible flow between close rotating disks. An asymptotic and numerical study. M.Israeli (Computer Sci. Dept., Technion-Israel Inst. of Technol., Haifa, Israel), M.Ungarish.
Comput. & Fluids (GB), vol.11, no.2, p.145-57 (1983).
Laminar steady compressible flow between close rotating thermally conducting axisymmetric disks with inflow was investigated by means of a numerical solution of the Navier-Stokes equation and an asymptotic analysis. The approximate solution, obtained for small ϵ, E and H (Rossby and Ekman numbers, and height/radius, respectively) is valid for 'merged', 'close' and 'separate' boundary layers on the disks, corresponding to $\beta \ll k1$, $\beta \simeq 1$ and $\beta \gg 1$, respectively (where $\beta = H/2\sqrt{E}/\rho$, and ρ is the non-dimensional density). These three cases may appear simultaneously in different regions of the same system due to the large variation of ρ in the radial direction. The small ϵ (i.e. negligible convection terms) does not necessarily imply small perturbations of the pressure, and a special treatment of the pressure term was used in order to account for this feature, which sometimes culminates in inversion of the radial pressure gradient. The numerical solution was obtained by a finite-difference, modified Cheng-Allen method, using a non-uniform mesh. The numerical and the approximate solution are in good agreement. (14 refs.)

66554 Analysis of a turbulent boundary layer subjected to a strong adverse pressure gradient. N.Afzal (Dept. of Mech. Engng., Aligarh Muslim Univ., Aligarh, India).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.563-76 (1983).
Two non-dimensional parameters $\Lambda = \tau_\omega / p_x \delta$ and $R_p = U_p \delta / \nu$ are defined where τ_ω is the wall stress, $p_\omega (>0)$ is the pressure gradient to which the turbulent boundary layer (of thickness δ) is subjected, ν is the kinematic viscosity, $U_p = (\nu p_x / p)^{1/3}$ is a characteristic velocity and p is the density. The limit corresponding to the strong adverse pressure gradient is formulated as $\Lambda \rightarrow 0$, $R_p \rightarrow \infty$, ΛR_p finite. Using appropriate inner and outer asymptotic expansions, both above a wall layer possibly scaling with τ_ω and ν, it is found by an application of Millikan's argument that there is an inertial sublayer where the streamwise velocity distribution obeys a half-power law, whose slope depends on Λ, and intercept on ΛR_p. Indeed comparison with available experimental data shows the inner law to be well represented by $\mu / U_p = (3.5 + 19\Lambda)(y U_p / \nu)^{1/2} + 2.5 \Lambda R_p$. The outer flow obeys a generalized defect law; use of constant eddy viscosity closure yields results in good agreement with experiment. (21 refs.)

66555 A few applications of the Nee-Kovasznay model for shear flow turbulence. R.Takaki (Faculty of General Education, Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1186-93 (April 1983).
The Nee-Kovasznay model is applied to the three turbulent shear flows; the wall region of the turbulent boundary layer, the plane mixing layer and the turbulent Rayleigh problem. The model equation is solved analytically, partly by the use of a technique analogous to the integral method for turbulence prediction. The former two applications are intended to determine the two unknown parameters in the model by comparing the theory with experiment, the results of which are $A = 0.20$ and $B = 2.2$. In the third problem approximate solutions for the mean velocity and the turbulent viscosity are obtained and compared with experiments. Agreements are satisfactory. The theory shows also some disagreements, which may be due to the lack of the concept of 'coherent structure' in the model. (15 refs.)

66556 A statistical theory of thermally-driven turbulent shear flows, with the derivation of a subgrid model. A.Yoshizawa (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1194-205 (April 1983).
A statistical theory is presented for the turbulent motion of an incompressible fluid subject to the Boussinesq convection. The Reynolds stress and the heat flux for arbitrary mean velocity and temperature distributions are calculated with the aid of the two-scale Direct-Interaction formalism, i.e. the DI formalism incorporated with the separation of scales of the mean and fluctuating fields. The two quantities are expressed in terms of binary correlations and responses of the fluctuating field, and these expressions are simplified by the use of the inertial-range theory. As an application of the results, a subgrid model is derived for the large-eddy simulation of turbulent shear flows with buoyancy effects. (18 refs.)

66557 Large-amplitude long waves in a shear flow. M.E.Stern, N.Paldor (Graduate School of Oceanography, Univ. of Rhode Island, Kingston, RI, USA).
Phys. Fluids (USA), vol.26, no.4, p.906-19 (April 1983).
Large amplitude disturbances in a boundary layer shear flow are considered in an inviscid and long-wave theory. Initially weak horizontal convergences are concentrated and amplified in time, thereby increasing the maximum normal velocity (ν) until it becmes comparable with the horizontal velocity. The effect is first demonstrated in a two-dimensional model having piecewise uniform vorticity. The leading edge of the compact disturbance propagates downstream more rapidly than the trailing edge, but no 'quiet' zone appears in the center. Instead $\nu \rightarrow \infty$ and a tendency for wavebreaking occurs. The evolving large ν pattern is consistent with observations of the laminar spike just prior to its breakdown. The long-wave theory is generalized to three-dimensional motions, and the effect of an initial spanwise divergence is such as to rationalize the initial vorticity assumed in the two-dimensional model. (9 refs.)

66558 Turbulent diffusion of mass in circular pipe flow. A.N.Puri, C.Y.Kuo, R.S.Chapman (Dept. of Civil Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Appl. Math. Modelling (GB), vol.7, no.2, p.135-8 (April 1983).
An implicit finite difference scheme was used to solve the convective-diffusion equation to predict the steady-state transport of a conservative, neutrally buoyant tracer injected along the centreline into a fully developed turbulent pipe flow. Three different distributions for the radial mass diffusivity have been compared with two independent sets of experimental data. The results indicate that the distribution based on the turbulent kinematic eddy viscosity predicted by a k-l model produces the closest agreement between the numerical model predictions and the experimentally observed tracer distribution. (14 refs.)

66559 Thermal diffusivity in mesophases: a systematic study in 4-4′-di-(*n*-alkoxy) azoxy benzenes. W.Urbach, H.Hervet, F.Rondelez (Phys. de la Matiere Condense, Coll. de France, Paris, France).
J. Chem. Phys. (USA), vol.78, no.8, p.5113-24 (15 April 1983).
The authors present a systematic study of thermal diffusivity in the nematic liquid crystalline phase of 4-4′-di-(*n*-alkoxy) azoxy benzenes and several other materials. The data allows separation of the respective contributions of the rigid central core and of the flexible aliphatic chains. For the components of the diffusivity tensor parallel to the long molecular axis, it is found that they differ by as much as a factor of 6 in favour of the core contribution. Combining the present observations with their earlier results, they are now able to draw general conclusions on the thermal diffusivity in a nematic and smectic A, B, and C phases. They have also developed two semiquantitative models based, one on a static network of distributed resistances, and the other on an extension of the Eyring kinetic model for the thermal conductivity of simple liquids. Only the dynamic model yields a satisfactory description of the authors' data. The distance over which the thermal energy is not transferred instantaneously upon collision between two neighbouring molecules is found to correspond to the aliphatic chain length (calculated for a freely rotating chain). Using this formalism, a priori calculations of the thermal diffusivities can be performed, to better than 20%, for any rodlike liquid crystalline material. (24 refs.)

(see also 44.25 Convective and constrained heat transfer)

66560 Phenomenon of wave-length increase in Rayleigh-Benard convection and criterion of maximum entropy production. Chen Shi-Gang (Inst. of Phys., Acad. Sinica, Peking, China), Wang You-Qin.
Acta Phys. Sin. (China), vol.32, no.2, p.209-15 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The phenomenon of wave-length increase occurred in Rayleigh-Benard convection is analysed by numerical method, and the result obtained is in good agreement with experiment. The calculations for stability and entropy production show that the criterion of maximum entropy production for relative stability of steady states is correct. (11 refs.)

66561 Effects of variable physical properties on free convection in a porous insulating layer. T.Masuoka (Dept. of Mech. Engng., Kyushu Inst. of Technol., Kitakyushu, Japan), H.Shimomura, Y.Okamoto.
Bull. JSME (Japan), vol.26, no.212, p.247-53 (Feb. 1983).
A numerical study is made of the effects of variable properties on free convection in vertical, helium- (or air-) saturated porous layer. The temperature differences between hot and cold boundary walls are as large as 1000°C. The effects of variations in viscosity, thermal conductivity and density are included. Flow patterns are found to be considerably distorted in a horizontal direction to the symmetrical patterns predicted by the constant-property theory, whereas the overall heat-transfer characteristics do not alter very much provided that representative properties are evaluated at a mean temperature. At sufficiently large amplitude of convection, however, the deviation from the Boussinesq approximation is not negligible. (11 refs.)

66562 Forced convection heat transfer from an elliptic cylinder of axis ratio 1:2. T.Ota (Dept. of Mech. & Prod. Engng., Akita Univ., Akita, Japan), S.Aiba, T.Tsuruta, M.Kaga.
Bull. JSME (Japan), vol.26, no.212, p.262-7 (Feb. 1983).
An experimental investigation has been made to clarify the heat transfer characteristics of an elliptic cylinder of axis ratio 1:2. The testing fluid was air and the Reynolds number ranged from about 5000 to 90000. The angle of attack α was varied from 0° to 90°. The local heat transfer behavior is clarified and it is quite different from that of a circular cylinder. In the region of $\alpha>40°$, the heat transfer rate from the upstream surface, on which a laminar boundary layer develops, becomes lower than that from the downstream surface in the separated flow region. The mean heat transfer coefficient Nu_m depends upon the angle of attack along with the Reynolds number. It is found that Nu_m is the highest for $\alpha=75°$ to 90° and is the lowest for $\alpha=30°$ over the whole Reynolds number range studied. The mean heat transfer rate from the elliptic cylinder investigated in the present work is higher than that from the circular cylinder at all the angles of attack over the Reynolds number range studied. (20 refs.)

66563 Heat transfer enhancement in oscillatory cavity flow. G.Antonini, E.Brunier, G.Guiffant (Dept. de Genie Chimique, Univ. de Technol. de Compiegne, Compiegne, France).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.13-23 (Jan.-Feb. 1983).
The unsteady fluid motion driven in a square cavity by the combined effects of a vibrating wall and natural convection is examined. The mean heat transfer characteristics of the oscillatory cavity flow are derived and discussed. (12 refs.)

66564 Water absorption by a solution of lithium bromide in wetted wall columns with tangential feed. S.Gabsi, R.Bugarel (Inst. du Genie Chimique Chemin de la Loge, Toulouse, France).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.49-58 (Jan.-Feb. 1983).
One of the most effective methods of increasing the rate of heat transfer is to carry it in the form of thin film. The purpose of the reported research is to investigate water absorption by a solution of lithium bromide under vacuum in wetted wall columns with tangential feed in order to apply it in a cycle of absorption heat pump. It is shown that film-wall heat transfer coefficient increases with pressure, vapor and liquid flow rate but it does not vary with the solution concentration in the range of the experiments. (22 refs.)

66565 Heat transfer by natural convection in a vertical porous layer. N.Rudraiah, T.Masuoka, M.S.Malashetty (Dept. of Maths., Central Coll., Bangalore Univ., Bangalore, India).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.59-76 (Jan.-Feb. 1983).
Heat transfer by a natural convection in a vertical porous layer heated from below and cooled from above is studied analytically. In the case of linear theory, the normal mode technique is used to find the criteria for the onset of convection and it is shown that convection sets in when the critical Rayleigh number exceeds π^2. The nonlinear theory is investigated using normal mode technique combined with the orthonormal sequences which determines the amplitudes and hence the heat transfer. It is shown that uni-cellular pattern exist and the corresponding heat transfer increases with Rayleigh number. (12 refs.)

66566 New method to determine characteristic time of viscoelastic fluids. E.Y.Kwack, J.P.Hartnett (Energy Resources Center, Univ. of Illinois, Chicago, IL, USA).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.77-82 (Jan.-Feb. 1983).
An extra dimensionless parameter involving the ratio of the elastic and viscous forces, the Weissenberg number, is necessary to correlate the friction and heat transfer behaviour of viscoelastic fluids. The evaluation of the Weissenberg number requires a measurement of the first normal force difference or, alternatively, the determination of the characteristic time of the fluid. The authors suggest that the characteristic time of viscoelastic fluids can be determined by a simple pressure drop measurement. The basis for the proposed method is presented. More detailed measurements are required to validate the procedure. (17 refs.)

66567 Exact solution of the thermal boundary-layer equations for an arbitrary heat-flux distribution on a surface in a flow. A.Sh.Dorfman (Inst. of Tech. Heat Phys., Acad. of Sci., Ukrainian SSR).
High Temp. (USA), vol.20, no.4, p.567-74 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.683-91 (July-Aug. 1982). [received: April 1983]
An exact solution of the equations for a thermal laminar boundary layer is obtained for an arbitrary distribution of the heat flux on the surface and a power-law velocity distribution in the outer flow. The solution is constructed in the form of a series in the shape parameters and in an integral form containing the influence function of the unheated section. The influence functions are calculated for gradient flows and arbitrary values of the Prandtl number. The results can be applied to heat-transfer calculations for any Neumann-type boundary condition. (11 refs.)

66568 Investigation of flow distribution in cells with triangular tubular bundles. P.I.Bystrov, A.A.Volovik, V.S.Mihkailov (Inst. of Railroad Transport Engrs., Dnepropetrovsk, USSR).
High Temp. (USA), vol.20, no.4, p.582-6 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.700-4 (July-Aug. 1982). [received: April 1983]
The results of experimental investigations of the flow distribution in cells with triangular tubular bundles with the relative spacing varying in the range $s/d=1.028$-1.5 are presented. Approximate dependences are proposed for calculating the hydraulic nonuniformity in the intertubular space of heat exchangers based on the use of the equation of motion of variable-mass flow in a quasi-one-dimensional formulation. (5 refs.)

66569 Calculation of heat transfer in smooth pipes with turbulent flow of gaseous heat-carriers with constant and variable physical properties. V.A.Kurganov (Inst. of High Temperatures, Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.587-93 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.705-11 (July-Aug. 1982). [received: April 1983]
Universal working equations are proposed for heat transfer to gases and vapors in hydraulically smooth heated pipes with turbulent flow and boundary conditions of the first and second kind. (22 refs.)

66570 A numerical simulation of 'convection' in a cylindrical geometry. P.Manneville (CENS, Gif-sur-Yvette, France).
J. Phys. (France), vol.44, no.5, p.563-71 (May 1983).
Rudimentary numerical simulations performed on a two-dimensional model of three-dimensional convection already give valuable information about the process of non-linear pattern selection in convection experiments. The author has considered a disc which corresponds to a cylindrical box with intermediate aspect ratio ($R/h\sim6$). Starting with low level random initial conditions they observe: 1) the linear growth of unstable modes, 2) a saturation stage during which the selection is very active, 3) a final reorganization corresponding to the slow motion of defects. Solutions which have been observed were stationary even with non-linear terms which did not derive from a potential. The structures found in these simulations are strikingly similar to those obtained experimentally with comparable aspect ratios and high Prandtl numbers. Limitations and possible improvement of the model are also discussed. (32 refs.)

66571 Nonlinear evolution of the disturbance in a natural convection induced in a vertical fluid layer. J.Mizushima (Dept. of Information Sci., Sagami Inst. of Technol., Fujisawa, Japan), K.Gotoh.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1206-14 (April 1983).
The nonlinear evolution of the disturbance in a natural convection induced in a fluid layer between two parallel vertical walls kept at different temperatures is investigated on the basis of the weakly nonlinear theory. The theory is used in an improved form for the evaluation of the coefficients in the evolution

equation of disturbance. The amplitude of disturbance and the heat transfer across the fluid layer are determined in a super-critical and equilibrium condition. The curve of the mean Nusselt number N versus the Grashof number G has a small hump at the critical Grashof number G_c, and that the estimation of N so far established is reasonable only in a narrow range of G close to G_c.

66572 Laminar flow of a non-Newtonian fluid in the thermal entrance region of a smooth pipe. K.Rup (Politech. Krakowska, Krakow, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.337-47 (1981). In Polish.
To investigate the influence of the temperature boundary condition of the third kind on the laminar heat transfer of a pipe, the energy equation is solved by applying the momentum integral method. The power-law model characterises the non-Newtonian behavior. Uniform and fully developed velocity profiles are considered. Constant fluid properties are assumed. The effect of heat generation by viscous dissipation is included. It is concluded that there can be a significant influence of Biot number, Brinkman number and flow index non mean temperature and local Nusselt number. The results are compared with the available solutions of Newtonian fluid: an excellent agreement has been found. (8 refs.)

66573 Loss of stability condition for free convection in a porous layer. B.Borkowski, W.Kordylewski (Politech. Wroclawska, Wroclaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.463-75 (1981). In Polish.
A stability analysis of two-dimensional natural convection in a porous layer has been performed. By means of Galerkin's method the system of two partial differential equations has been replaced by a system of six ordinary differential equations,. The branch of steady-state solutions referring to the primary stage of free convection has been determined. The condition for stability loss of fluid motion in a porous layer induced by a temperature gradient is determined by the Hopf bifurcation point for a Rayleigh number equal to $30\pi^2$. (13 refs.)

66574 Heat transfer in a bounded vortex MHD-flow with volume heat release. O.A.Glazov.
Magnetohydrodynamics (USA), vol.18, no.3, p.254-8 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.52-6 (July-Sept. 1982). [received: April 1983]
Heat transfer in a vortex flow bounded by a cylindrical surface of radius r_o is discussed. The z axis of the cylindrical coordinate system (r, ϕ, z) is assumed to be directed along the axis of the cylinder bounding the flow. Boundary conditions of the first kind, which are dependent in a periodic way on the azimuthal coordinate, are adopted on the cylindrical surface: $T(r_0,\phi)=T_0+T_a\sin\phi$, where T_o and T_a are assumed to be constant positive quantities. The heat transfer by a vortex flow under the above boundary conditions is investigated in the presence of a steady heat release $q_e(r,\phi)$ in the fluid volume. (1 ref.)

66575 Natural convection with transpiration over a vertical porous plate at high temperature. Effects of a nonuniform blowing. D.Lemonnier, Doan-Kim-Son (Lab. de Thermique, ENSMA, Poitiers, France).
Mech. Res. Commun. (GB), vol.9, no.6, p.359-65 (Nov.-Dec. 1982). [received: March 1983]
A numerical study suitable for large ambient-wall temperature differences is developed and consideration is given to the influence of non uniform blowing on the velocity and temperature profiles and heat transfer. It was found that the natural convection flow with blowing and suction is not only dependent on the quantity of fluid that is being transpired but also on the distribution of this transpiration. Particularly, the heat transfer between the plate and the fluid was found to be very sensitive to both transpiration rate and blowing distribution. (5 refs.)

66576 Effect of rotation on the stability of a bounded cylindrical layer of fluid heated from below. J.C.Buell, I.Catton (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).
Phys. Fluids (USA), vol.26, no.4, p.892-6 (April 1983).
The onset of steady natural convection in a rotating cylindrical volume of fluid completely bounded by rigid surfaces is examined for moderate Taylor numbers ($Ta \leq 2\times10^6$) and aspect ratios ($A\leq2$). The critical Rayleigh number for three dimensional disturbances is found to be lower than that for the radially unbounded problem by up to a factor of six. The thermal boundary condition on the lateral walls is shown to have a greater effect here than in the nonrotating case. (12 refs.)

66577 Free convection flow of a second-order fluid along a porous vertical plate with periodic suction. R.C.Chaudhary, P.R.Sharma (Dept. of Math., Univ. of Rajasthan, Jaipur, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.6/3-22 (Nov. 1982). [received: April 1983]
The authors study three-dimensional flow and heat transfer for a non-Newtonian fluid, i.e. free convection flow of a second-order fluid along a porous vertical plate with transverse sinusoidal suction velocity distribution. The effect of the non-Newtonian fluid parameter on the stress component and heat flux has been discussed numerically. (4 refs.)

66578 Heat induced flow effects on heat transfer properties of a pulsed superconductor. R.S.Kensley, Y.Takahashi, K.Okuno, M.Nishi, H.Tsuji, L.Dresner, T.Ando, S.Shimamoto.
Report JAERI-M-82-107, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Aug. 1982), 18 pp.
Heat transfer properties of a pulsed conductor, called JA-10, were measured and important effects caused by heat induced flow were found. JAERI has developed the conductor JA-10 for research and development of superconducting poloidal coils for Tokamak reactors. JA-10 is a 10 kA, 7-T pulsed conductor with NbTi bundles around a stainless steel flat core. Heat transfer properties from the surface of this conductor is an important basis for its stability during pulsed operation, therefore the authors measured the heat transfer property under the same conditions as a wound coil. By this experiment, it was clarified that turbulent flow in the uninterrupted vertical cooling channels strongly enhance heat transfer properties of a pulsed conductor like JA-10. (4 refs.)

66579 Forced flow cooling studies of volumetrically heated porous layers. V.X.Tung, V.K.Dhir, D.Squarer (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.876-83 vol.2
Experiments were conducted in a 9.5 cm ID pyrex jar with a filter plate to support the particulate layer. The jar had a provision for flow of subcooled liquid at the bottom. In the experiments the size of the spherical particles was varied from 3175 to 4763 μM while the bed porosity was kept fixed at about 0.4. The porous layer height was varied from 10 cm to 20 cm. The particles were heated inductively. Freon-113 was used as the coolant. The flowrate of the coolant and the volumetric heat generation rate in the particles were varied so that either superheated or wet vapor could exit the porous layer. The porous layer temperature was measured at different locations with 30-gage copper-contantan thermocouples. The pressure drops between different segments of the porous layer were measured with manometers. (6 refs.)

47.25R Wakes

66580 An experimental investigation of the wake of an axisymmetric body with a slanted base. X.J.Xia, P.W.Bearman (Dept. of Aeronautics, Imperial Coll., London, England).
Aeronaut. Q. (GB), vol.34, pt.1, p.24-45 (Feb. 1983).
The effect of base slant on the base pressure distribution, drag coefficient and vortex shedding characteristics of a model consisting of an axisymmetric main body with an ellipsoidal noise have been investigated for three fineness ratios; 3, 6 and 9. A sudden change in the drag coefficient and separated flow pattern is observed at a critical slant angle (for constant incident) or at a critical angle of incidence (for a constant base slant angle). The tests confirm that the value of the maximum drag coefficient is extremely sensitive to angle of incident. Measurements of the frequency of vortex shedding are presented and the structure of the wake is investigated using smoke visualization and hot-wire correlation measurements. The wake is found to be far less stable than that from a two-dimensional bluff body and the vortex structures are sometimes in-phase and sometimes out of phase across the wake. The effect of free-stream turbulence on this family of body shapes is observed to be different to that on three-dimensional blunt-faced bluff bodies. Free-stream turbulence is found to have a minimal effect on base pressure for slant angles giving a recirculating type near wake flow. When longitudinal vortices are present the addition of free-stream turbulence slightly reduces the magnitude of the peak suctions recorded on the base but has little effect on base drag. (17 refs.)

47.30 ROTATIONAL FLOW AND VORTICITY

66581 On the calculation of the velocity induced b a vortex-source cone. K.Varsamov, K.Yosifov, A.Haimov.
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.455-61 (1981). In English.
Describes the transition from numerical quadrature to linearized expressions for calculation of the velocity induced by unit vortex cones at points near the

vortex sheet. A criterion is obtained by comparing the results with the exact solution for singularity distribution of constant strength. (3 refs.)

66582 Interaction of a turbulent conducting vortex with a magnetic field. L.P.Gorbachev, A.Yu.Matronchuk.
Magnetohydrodynamics (USA), vol.18, no.3, p.249-53 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.47-51 (July-Sept. 1982). [received: April 1983]
The motion of a turbulent vortex ring in an infinite incompressible fluid has been discussed in previous work. Such motion is described with the help of the turbulent viscosity, and the self-similar problem for the case in which the viscosity depends on time has been investigated. Turbulent motion of a cylindrical vortex is investigated within the framework of the model of an incompressible fluid; the pressure is assumed to be constant over the entire volume of the vortex. A nonlinear equation in a cylindrical coordinate system is used to describe the turbulent vortex. (5 refs.)

66583 Atomistic nonequilibrium computer simulations. W.G.Hoover (Dept. of Appl. Sci., Univ. of California, Davis, CA, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.111-22 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
Newton's, Lagrange's and Hamilton's equations of motion have been modified to include the effects of constraints, nonequilibrium fluxes, and gradients. These nonclassical equations provide estimates of the linear transport coefficients and, through nonlinear dissipative terms can also simulate nonequilibrium steady states. To illustrate the modified equations of motion, the author applies them to a simple three-oscillator problem. The new methods have also been used to study nonlinear problems with large coupled gradients. He describes two examples: the coupling of heat flow with rotation and the simulation of strong shockwaves in dense fluids. (23 refs.)

66584 *N*-solitons on a vortex filament. D.Levi (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland), A.Sym, S.Wojciechowski.
Phys. Lett. A (Netherlands), vol.94A, no.9, p.408-11 (4 April 1983).
The authors describe a purely algebraic algorithm for finding, in the localized induction approach, three-dimensional vortex motion corresponding to the N-soliton solution of the nonlinear Schrodinger equation. The method used relies essentially upon the geometric approach to soliton systems and consists in the construction of the corresponding soliton surfaces. For $N=0$ and $N=1$ they recover the straight line and Hasimoto vortex respectively, while for $N=2$ the algorithm gives a new vortex motion, of higher complexity, which is, presumably, an analytic expression for some scattering phenomena along vortices recently discovered by Browand and Hopfinger (1982). 47.35 WAVES

66585 The pressure characteristics of random water waves. Yi-Ku.Kuo, Her-Yuan Chen (Dept. of Civil Engng., Nat. Chiao Tung Univ., Hsinchu, Taiwan).
J. Chin. Inst. Eng. (Taiwan), vol.6, no.1, p.1-8 (Jan. 1983).
An empirical formula is suggested by laboratory data to describe the relationship between surface wave heights and wave pressure fluctuations. This formula can not only be used in monochromatic waves, but also can determine the attenuation of random pressure fluctuations. The expected error is about 10%. Based on this fact, it is known that the linear superposition consideration is applicable to wave spectral model approximately even in the moderate shallow water region. On the other hand, from the existing experimental results, it has been shown that the statistical wave heights can be estimated through the transformation of the root-mean-square values of the wave pressure records to those of the water surface displacements. (11 refs.)

66586 Shallow water waves: conservation laws and symplectic geometry. Y.Akyildiz (Math. Sci., Univ. of Petroleum and Minerals, Dhahran, Saudi Arabia).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.27-8 (11 April 1983).
The author shows that shallow water equations on a sloping beach can be cast into hamiltonian form, that they have infinitely many polynomial conserved quantities in involution and that there are associated symplectic Backlund transformations. (3 refs.)

66587 Nonlinear interfacial progressive waves near a boundary in a Boussinesq fluid. D.I.Pullin (Dept. of Mech. Engng., Univ. of Queensland, St. Lucia, Queensland, Australia), R.H.J.Grimshaw.
Phys. Fluids (USA), vol.26, no.4, p.897-905 (April 1983).
The behavior of nonlinear progressive waves at the interface between two inviscid fluids in the presence of an upper free boundary is studied as a model of waves on the thermocline. A set of relationships between the integral properties of bounded waves in a general two-fluid model is first developed and the Stokes expansion to third order is derived. The exact free boundary problem for the wave profile is then formulated within the Boussinesq approximation as a nonlinear integral equation, which is solved numerically using two different numerical methods. For finite velocity difference across the two-fluid interface bifurcation of solutions into upper and lower branch wave profiles with quite different properties is obtained. Numerically calculated wave shapes and integral properties show good agreement with third-order Stokes expansion predictions in the weakly nonlinear regime for waves which are not too long. Very long waves were found to exhibit distinct solitary wave-like features. (15 refs.)

66588 Small-amplitude finite-rate waves in suspensions of particles in fluids. A.Kluwick (Tech. Univ. Wien, Wien, Austria).
Z. Angew. Math. & Mech. (Germany), vol.63, no.3, p.161-71 (1983).
Deals with the propagation of weakly nonlinear waves in homogeneous suspensions. Under the assumption that a one-dimensional treatment is adequate the properties of these waves are investigated in stable as well as unstable flow and near the stability limit. Special emphasis is placed on the discussion of waves of constant form. (34 refs.)

(see also 28.70 Nuclear explosions, 52.35T Plasma shock waves)

66589 Effect of initial conditions on constant pressure mixing between two turbulent streams. S.Kangovi (Nat. Aeronautical Lab., Bangalore, India).
Aeronaut. Q. (GB), vol.34, pt.1, p.61-75 (Feb. 1983).
A study of the process of mixing and wake development has varied applications in wide ranging fields like jet ejectors, wake signatures, base pressure control, combustors, flow over cut-outs, jet noise and jet interactions. In real flows the wake is usually divided into two zones namely, the near field and the far field. The near field is usually controlled by initial conditions which involve two back-to-back boundary layers separating from the trailing edge of a solid surface. In the far field the flow becomes fully developed and assumes self similarity. The properties of fully developed far field have been well established but little is known about the near field. This paper describes the application of an integral analysis to study the effects of initial conditions like velocity ratio, initial boundary layer thickness, compressibility and temperature ratio on the development of near field of the turbulent mixing layer between two compressible, non-isoenergetic streams at constant pressure. Results include velocity and temperature profiles and the location of jet boundary line in the mixing layer. These results show the gradual approach of the mixing layer to self-preservation. (17 refs.)

66590 Compressible Rayleigh-Taylor instability. L.Baker (Mission Res. Corp., Albuquerque, NM, USA).
Phys. Fluids (USA), vol.26, no.4, p.950-2 (April 1983).
The role of compressibility in modifying the growth rate of Rayleigh-Taylor instability is discussed. Compressibility can either enhance or decrease the growth rate. If the sound speeds in the two media are the same, compessibility can still have an effect, in contrast to 'fist-order' theory. Compressibility becomes less important as the density ratio between the fluids increases. Experimental results have shown that compressibility can enhance growth rates compared to the incompressible value. (14 refs.)

47.40D General subsonic flows

66591 Methods of loss estimation in compressible flow through pipe orifices and nozzles. Y.Torizumi, N.Hirayama, T.Maeda (Tokyo Metropolitan Univ., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.212, p.215-22 (Feb. 1983).
Compressibility effects on the characteristics of the flow through orifices and nozzles have been investigated, theoretically and experimentally, under the conditions of subsonic and supercritical flow regimes. A practical experimental formula is proposed by expressing the amount of loss as a ratio of loss coefficient of compressible flow case to that of incompressible flow case. The results of energy flow measurement indicate that the major part (60-70%) of the total dissipation energy arises within one-pipe diameter downstream of orifice. In addition, by measurements of the velocity and wall pressure, it is confirmed that the maximum pressure recovery does occur at 2 to 3 times the pipe diameter downstream of the reattachment point, and this location corresponds to the point where the irregularity of the velocity distribution due to the existence of orifice almost disappears. (10 refs.)

66592 Compressible three-dimensional stagnation point flow over a moving wall. R.Krishnaswamy, G.Nath (Dept. of Appl. Math., Indian Inst. of Sci., Bangalore, India).
Curr. Sci. (India), vol.52, no.3, p.118-20 (5 Feb. 1983).
The steady laminar compressible three-dimensional stagnation point flow over a moving wall with mass transfer has been studied and a three-dimensional analogue of two-dimensional separation has been presented. Both nodal and saddle point regions have been included in the analysis. The equations governing the flow have been solved numerically using an implicit finite-difference scheme. The effect of moving wall, mass transfer, compressibility and wall temperature on the flow field is found to be appreciable. (12 refs.)

47.40H Transonic flows

66593 A vectorized finite element method for the computation of transonic tridimensional potential flows. C.Bonnet, Y.Vigneron, T.Lejal, O.Brocard, J.Bousquet.
Bull. Dir. Etud. & Rech. Ser. C (France), no.1, p.45-50 (1983). In French, English. (1^{er} Colloque International sur les Methodes Vectorielles et Paralleles en Calcul Scientifique (1st International Colloquium on Vectorial and Parallel Methods in Scientific Calculations), Paris, France, 17-18 March 1983).
An algorithm is described to compute transonic flows around complex shapes such as civil transport aircraft. The potential solution is obtained as the limit of the minimums of a sequence of modified pressure integrals. Finite elements are used to discretize the problem. The calculation of the 'gradients of the integrals to be minimized has been vectorized by the Cray-1 and Cyber 205 computers. Computing times are given for the Cray-1S, Cray-1M, Cray XMP, as well as for the CYBER 205, 2 and 4 pipes. They are compared with those obtained on the Cyber 170/750. (3 refs.)

47.40K Supersonic and hypersonic flows

66594 Numerical simulation of a compressible turbulent boundary layer over a conductive wall with line heat source. D.Degani, A.Brosh (Technion-Israel Inst. of Technol., Haifa, Israel).
Comput. & Fluids (GB), vol.11, no.2, p.85-93 (1983).
A conjugated problem of supersonic turbulent flow over a conductive solid wall with an embedded line heat source has been investigated as a model of a separation detector and skin friction gage. The 2-D Navier-Stokes equations for compressible fluid, including a two layer eddy viscosity model, are solved simultaneously with the heat transfer equation for the solid, written in general coordinates. The effect of the interface boundary condition on the stability of the implicit scheme of the flow field has been checked. A careful investigation of the effect of heat source strength, solid and fluid conductivity and Mach and Reynolds numbers on flow and temperature fields has been performed. The results of this investigation may be used to design an optimal gage with a minimum influence on the flow field. (16 refs.)

47.40N Shock-wave interactions

66595 Characteristic method applied to blast waves in a dusty gas. F.Higashino (Stosswellenlabor, Rheinisch-Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.399-406 (April 1983).
The unsteady propagation of shock waves in a dusty gas is investigated theoretically. The characteristic equations are obtained without neglecting the effect of the partial pressure of the particles. Numerical computations were carried out by Hartree's technique. As examples, the flow in a shock tube and in a blast wave is examined by applying a generalized piston problem. The results show that the existence of suspended particles may cause a rapid decay of the shock strength and that the flow field is divided into several regimes which are characterized by the shock position and the relaxation times. 66596 Asymmetries in evaporation and condensation Knudsen layer problems. T.Ytrehus (Norwegian Inst. of Technol., Trondheim, Norway).
Phys. Fluids (USA), vol.26, no.4, p.939-49 (April 1983).
Basic symmetries are shown to exist between half-space problems for evaporation and those for condensation, in the regime of linear transport. The asymmetry is determined by the normalized latent heat of the substance, which is found to have a critical influence upon the flow behavior in the condensation problem. The analysis is based upon the linearized Maxwell-Boltzmann transport equation, and the results indicate nonexistence of solutions to the condensation half-space problem for substances with latent heat below a certain critical value. (20 refs.)

66597 Flow of gases at low density through a packed bed. On the equivalent diameter and tortuosity factor. T.Kanki, S.Iuchi.
Rep. Himeji Inst. Technol. (Japan), no.35A, p.9-21 (1982). In Japanese.
Porous flow of gases at low density is studied on the basis of the equivalent capillary model. Based on the mean free path theory, the equivalent diameter is newly defined for free molecule flow as the ratio of molecular velocity to frequency of collisions of molecules with wall of porous structure. Despite the definition limited to the free molecule flow, the equivalent diameter is shown to be identical to Blake's one, $D_{eq}=4\epsilon/S_v(1-\epsilon)$ for continuum flow. In addition, a distribution law of radii of sectional area of spherical particles packed uniformly is deduced from statistical arguments and is applied to determine the tortuosity factor, which is given as a function of the porosity as $q=(2-\epsilon)^{3/4}$. Applying these results to the equivalent capillary model, expressions for permeability of gases through a packed bed are derived for free molecule, continuum, and transition flows. Also, the dependence of porosity on the Kozeny constant is briefly discussed. (13 refs.)

47.50 NON-NEWTONIAN DYNAMICS

66598 Effect of small-amplitude harmonic vibrations on viscoelastic flows in a plane slider bearing. S.Zahorski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.1, p.73-88 (1982).
Considers the case of small-amplitude harmonic vibrations superposed on flow in a plane slider bearing (wedge flow), i.e. the situation fundamental in the lubrication theory. To discuss separately the influence of normal stresses and variable (apparent) viscosities on the lift and frictional forces in the bearing, the authors applied the model of viscoelastic second-order fluid and the simple model of viscous fluid with shear-dependent viscosity. A perturbation method proposed by Walters et al. (1971) is used to obtain effective solutions up to the second-order terms. The cases of moving slider and stationary base and vice versa as well as the mixed cases in which vibrations are acting either on the upper or the lower part of the bearing are discussed in greater detail. It is shown that normal stresses exert positive influence on the load capacity of the vibrating bearing, while the variable viscosity leads to an opposite effect. On the other hand, the frictional forces on moving and vibrating parts of the bearing are usually greater than in the case of purely Newtonian fluids. (12 refs.)

66599 Non-Newtonian behavior of polymeric liquids. R.B.Bird (Chem. Engng. Dept., Univ. of Wisconsin-Madison, Madison, WI, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.3-16 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
A survey is given of the three main approaches to the study of the non-linear constitutive equations for polymer solutions and polymer melts: rheometric measurements in shear and elongational flows, continuum mechanics results for special flows and useful empiricisms; and molecular theories, including single-molecule theories for dilute solutions and network and reptational theories for melts. (33 refs.)

66600 Molecular dynamics simulations of the rheological properties of simple fluids. D.J.Evans (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Physica A (Netherlands), vol.118A, no.1-3, p.51-68 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
Reviews some of the principal results obtained from non-equilibrium molecular dynamics simulations of Couette flow in fluids. The simulations show that even simple fluids exhibit a wide variety of non-Newtonian behaviour (e.g. viscoelasticity, shear thinning and dilatancy, normal stress differences and non-local momentum transport). The asymptotic dispersion relations for each of these effects is consistent with the non-analytic functional forms predicted using 'long-time-tail theories. However in each case, the magnitude of the observed effect is much larger than theoretical predictions. The author shows that non-linear irreversible thermodynamics successfully relates a number of these non-Newtonian effects observed, very far from equilibrium, outside the regime of local thermodynamic equilibrium. (47 refs.)

66601 Similarities and differences in the nonlinear flow behavior of simple and of molecular liquids. S.Hess (Inst. fur Theoretische Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Physica A (Netherlands), vol.118A, no.1-3, p.79-104 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
After the introduction of viscosity coefficients describing the non-Newtonian flow behavior and the normal pressure differences in a plane Couette symmetry, methods for the calculation of these coefficients are presented and some remarks on the connection with the linear viscoelasticity are made. The nonlinear flow behavior stems from the influence of the vorticity of the flow field and of the symmetric traceless shear rate tensor on the primary shear-rate-induced anisotropy of molecular distribution functions. In the case of molecular liquids the orientational distribution of the molecular axes (alignment) is the most relevant quantity; in simple liquids it is the pair-correlation function. Results are presented which can be inferred from an extended version of irreversible thermodynamics of molecular liquids; from a Fokker-Planck equation approach and for simple liquids, from a kinetic equation of Kirkwood-Smoluchowski type for the pair-correlation function. Finally, some modifications are discussed which lead to a nonanalytic shear-rate and frequency dependence as observed for the viscosity coefficients in the computer simulations. (77 refs.)

66602 Finite-amplitude periodic extensional flows. R.L.Powell (Dept. of Chem. Engng., Washington Univ., St. Louis, MO, USA).
Phys. Fluids (USA), vol.26, no.4, p.890-1 (April 1983).
By specializing the class of unsteady extensional flows considered by Slattery (1964) to motions which are periodic perturbations about a rest state and using the proper presentation for Noll's (1958) simple fluid undergoing such flows, explicit formulas for the induced stresses in terms of measurable material properties were achieved. It is found that oscillations of a sufficiently large amplitude will generate steady stresses in the fluid due to its nonlinear viscoelastic properties implying that orientation effects might be found in such flows. (9 refs.)

66603 Adiabatic shearing of incompressible fluids with temperature-dependent viscosity. C.M.Dafermos, L.Hsiao (Brown Univ., Providence, RI, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.45-58 (April 1983).
A convenient test problem for elucidating the effects of the dependence of viscosity on temperature is provided by adiabatic rectilinear shearing flow of an incompressible viscous fluid between two parallel plates. In this case the conservation equations are particularly simple and viscosity is the sole dissipative mechanism present. (2 refs.)

66604 The dynamics of simple fluids in steady circular shear. J.D.Goddard (Univ. of Southern California, Los Angeles, CA, USA).
Q. Appl. Math. (USA), vol.41, no.1, p.107-18 (April 1983).
An isotropic simple fluid of constant density ρ is confined between two infinite horizontal planes which rotate steadily about separate vertical (z) axes with common angular velocity ω. The author shows that at least one solution to the exact equations of motion is determined by the differential equation: $(\mathrm{d}/\mathrm{d}_z)(\eta[\mathrm{du}/\mathrm{dz}])i\rho\omega u=0$, where $u(z)$ is a complex variable representing the horizontal velocity and $\eta(|du/dz|, \omega)$ is a complex shear modulus. This equation represents the extension to nonlinear viscoelasticity of the previous works of R. Berker (1963) and of T.N.G. Abbott and K. Walters (1970) on linear viscoelastic fluids, for which η reduces to the usual dynamic viscosity $\eta^*(\omega)$. (15 refs.)

66605 Mechanism of pseudo-shock wave in supersonic jet. M.Nagai (Univ. of the Ryukyus, Okinawa, Japan).
Bull. JSME (Japan), vol.26, no.212, p.207-14 (Feb. 1983).
Concerning the overexpanded supersonic jet, interaction between the normal shock wave immediately downstream of the D'Laval nozzle exit and the shear layer of the jet boundary was investigated experimentally. The following were demonstrated. (1) The normal shock wave changes into a pseudo-shock wave immediately after its occurrence in the flow, (2) the pseudo-shock wave is several jet diameters in length but somewhat shorter than the pseudo-shock wave in duct flow, (3) its pressure ratio is extremely small compared with that of the normal shock wave and nearly proportional to the Mach number immediately upstream of the pseudo-shock wave. (16 refs.)

66606 An experimental investigation into the effect of changes in the geometry of a slot nozzle on the heat transfer characteristics of an impinging air jet. H.Hardisty (School of Engng., Univ. of Bath, Bath, England).
Proc. Inst. Mech. Eng. Part C (GB), vol.197, p.7-15 (March 1983).
High velocity, impinging, air jets are commonly user for heating, cooling, drying etc., because of the high heat transfer coefficients which occur in the impingement region. To provide data for design, a variety of slot nozzles has been tested to determine the effect on heat transfer of both nozzle shape and slot width. A small heat flux meter was used to measure local values of the heat transfer coefficient in the impingement zone, and these local values were integrated to yield space average values. As a necessary preliminary to the heat transfer investigation, the discharge coefficients of the nozzles were measured. From the first test series it was found that heat transfer results from differently shaped nozzles could be satisfactorily correlated provided that the effective slot width was used to characterize nozzle shape. From the second test series it was found that for geometrically similar arrangements, narrower slots gave higher heat transfer coefficients. (12 refs.)

66607 Efficiency of combined jet cooling of a plate in conditions of complex heat transfer. V.V.Glazkov, M.D.Guseva, B.A.Zhestkov, V.P.Lukash.
High Temp. (USA), vol.20, no.4, p.575-82 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.692-9 (July-Aug. 1982). [received: April 1983]
The conditions in which the relative flow rate of coolant used to create the projective jet for combined jet cooling of a wall as a minimum are determined. The general cases of wall cooling with complex heat transfer, combined jet cooling in conditions of convective heat transfer, jet cooling of a nonheat-conducting wall heated by a radient heat flux, and jet cooling of a heat-conducting wall are considered. Experimental and calculated values of the wall temperature are compared in the case of combined jet cooling with complex heat transfer. (10 refs.)

66608 Eddy viscosity in axially symmetric, swirling jets. S.Drobniak (Politech. Czestochowska, Czestochawa, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.477-90 (1981). In Polish.
The results are presented of experiments carried out in order to find the evolution of eddy viscosity in swirling jets. The existence of a semi-preserving region has been proved in this kind of flow and the behaviour of a turbulent Reynolds number has also been checked. (9 refs.)

66609 A theoretical prediction of the fluid buckling frequency. J.O.Cruickshank (Res. Div., Carrier Corp., Syracuse, NY, USA).
Phys. Fluids (USA), vol.26, no.4, p.928-30 (April 1983).
A simple theoretical model of the coiling frequency for a buckled axisymmetric fluid jet is developed. The special case of a jet dominated by viscous and gravity forces is considered, and the theoretical prediction is compared with experimental data. (4 refs.)

66610 Semi-elliptic computation of an axisymmetric transonic nozzle flow. M.Rizk, M.A.Serag-Eldin, A.Mobarak (Dept. of Mech. Engng., Cairo Univ., Giza, Egypt).
Appl. Math. Modelling (GB), vol.7, no.2, p.123-7 (April 1983).
A newly developed, semi-elliptic computational algorithm is employed to predict the transonic flow inside an axisymmetric, convergent-divergent nozzle featuring small wall radius of curvature at the throat. The predictions obtained are compared against flow measurements for this nozzle, which have been reported elsewhere. Good agreement between the corresponding measurements and predictions is revealed, thus validating the computational algorithm and demonstrating its value as a design tool. (8 refs.)

66612 Experimental study on sluggish bubble behaviors in pressure waves. H.Kimoto (Osaka Univ., Osaka, Japan), T.Fujii, T.Hirose.
Bull. JSME (Japan), vol.26, no.212, p.223-30 (Feb. 1983).
By means of high-speed photography and pressure transducers, the motion of a gas- or a vapour-slug bubble is observed in pressure waves. The velocity of a water jet, formed at the spherical top surface of a slug bubble, is measured on the high-speed photographs, and it is confirmed that the velocity is less than 10 m/s even in the case of a vapour slug bubble, and that the pulsation of the gas slug bubble in the pressure waves is treated as an adiabatic one. Moreover, the impact pressure of the water jet against the pressure transducer, set in the gas slug bubble, is measured, and it is also confirmed that the value is the same as the one, estimated by the stagnation pressure of the water jet. (10 refs.)

66613 Frictional resistance in fiber suspensions. I. Pipe flow. H.Kato, H.Mizunuma (Tokyo Metropolitan Univ., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.212, p.231-8 (Feb. 1983).
Viscous properties and pipe flow resistance of fiber suspensions are experimentally investigated. The authors employ several synthetic fibres with various aspect ratios and microscopic asbestos fibers. The viscosity of fiber suspensions decreases with an increasing shear rate but it exhibits Newtonian viscous behavior at very high shear rate. The viscous property of synthetic fiber suspensions is correlated experimentally to the aspect ratios. In synthetic fibers, turbulent drag reduction is due to an increase in log profile's gradient. This increase is affected by their stiffness, aspect ratio, concentration and others. Their correlation is experimentally determined. In asbestos fibers, thickening of viscous and buffer layers also contributes to the drag reduction. (6 refs.)

66614 Frictional resistance in fiber suspensions. II. Flow on a rotating disk. H.Mizunuma, H.Kato (Tokyo Metropolitan Univ., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.212, p.239-46 (Feb. 1983).
For pt.I see ibid., vol.26, no.212, p.231-8 (1983). The frictional moment in fiber suspensions is measured to investigate experimentally the flow on a rotating disk. In laminar region and in case of aspect ratio beyond 200, the fiber flocculence increases the frictional resistance. In turbulent region, the drag-reduction increases with the aspect ratio. Though the effect of disk diameter is little, the drag reduction increases with the diameter. These phenomena are correlated with those in pipe flow. (9 refs.)

66615 The Faxen formulae for a rigid particle in an unsteady non-uniform Stokes flow. R.Gatignol (Lab. de Mecanique Theorique, Univ. Pierre-et-Marie-Curie, Paris, France).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.143-60 (1983).
A method for calculating the drag and torque of a solid particle moving non-uniformly in an unsteady stream of viscous incompressible fluid is proposed. The problem is formulated in a conventional way in a frame linked to the particle. By using the Fourier transform and some reciprocity formulae the drag and the torque are deduced from knowledge of the normal stress vector on the particle in very simple flows. The results are given explicitly for the case of a spherical particle and are in agreement with the formulae known in various special cases. (30 refs.)

66616 Turbulent heat transfer on the surface of a steam-chugging bubble. C.K.B.Lee (R&D Associates, Marina del Rey, CA, USA).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.25-37 (Jan.-Feb. 1983).
The length and velocity scales of the turbulent eddies at the surface of a type of steam-chugging bubble (the detached bubble) are derived from a physical model. The corresponding turbulent heat transfer result, which contains no free parameters, is $\mathrm{Nu}=0.04$, $\mathrm{Re}^{7/8}$, $\mathrm{Pr}^{1/2}$. A comparison with the available experimental data shows excellent agreement. (13 refs.)

66617 Numerical optimization studies of axisymmetric unsteady sprays. S.K.Aggarwal, G.J.Fix, D.N.Lee, W.A.Sirignano (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Comput. Phys. (USA), vol.50, no.1, p.101-15 (April 1983).
A hybrid numerical technique is developed for the treatment of axisymmetric unsteady spray equations. An Eulerian mesh is employed for the parabolic gas-phase subsystem of equations while a Lagrangian scheme (or method of characteristics) is utilized for the droplet equations. The integration schemes and the scheme for interpolation between the two meshes are demonstrated to be second-order accurate. The effects of interesting numerical parameters such as mesh size, number of droplet characteristics, time step, and the injection pulse time are determined via a parameter study. (7 refs.)

66618 On a mathematical model of colmatage process in cracks and its application. O.Cieslicki (Politech. Warszawska, Inst. Automatyki Przemyslowej, Warsaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.385-95 (1981). In Polish.
Presents the phenomenological model of a phenomenon accompanying the flow of suspension through a micro-gap. The phenomenon is called the colmatage process and depends on trapping the dispersion phase particles. The particles being trapped in the gap divide its area into separate segments. It was assumed that a single particle stopped in the crack segment can divide or remove the segment, depending on the mutual dimensions. The number of segments—C and the characteristic dimension of flow width—L after flow of the volume V of liquid have been calculated. The analysis is based on the computer solved results of the set of formulated, nonlinear differential equations. Also the approximate, analytical solution of the set has been obtained. (7 refs.)

66619 The effect of Brownian motion on the transport properties of a suspension of spherical particles. B.U.Felderhof (Inst. fur Theoretische Phys., Tech. Hochschule Aachen, Aachen, Germany).
Physica A (Netherlands), vol.118A, no.1-3, p.69-78 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
Discusses the effect of Brownian motion on the transport properties of a suspension of spherical particle immersed in an incompressible fluid satisfying the equations for creeping flow. The author derives a Smoluchowski equation for the probability distribution in the particle configuration space with time-dependent imposed flow and applied forces. It is shown that retardation of the distribution function gives rise to a frequency dependence of the effective viscosity of the suspension. (23 refs.)

66620 Growth law dynamics in a phase separating fluid. R.C.Desai, S.W.Koch, F.F.Abraham (IBM Res. Lab., San Jose, CA, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.136-43 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
From a molecular dynamics experiment of an unstable two-dimensional fluid undergoing phase separation, the authors observe two principal growth regimes: (1) spinodal decomposition with a wavelike morphology followed by (2) a transition to cluster formation and growth due to atomic condensation and cluster coagulation. In the second regime the growth law is $t^{1/2}$. This dependence arises from the isothermal growth law for vapor accretion on two-dimensional clusters in a 'one' component supersaturated vapor. The details of theoretical analysis that leads to $t^{1/2}$ growth law are presented. (4 refs.)

66621 Equation of motion for a small rigid sphere in a nonuniform flow. M.R.Maxey (Dept. of Chem. Engng., Johns Hopkins Univ., Baltimore, MD, USA), J.J.Riley.
Phys. Fluids (USA), vol.26, no.4, p.883-9 (April 1983).
The forces on a small rigid sphere in a nonuniform flow are considered from first principles in order to resolve the errors in Tchen's equation and the subsequent modified versions that have since appeared. Forces from the undisturbed flow and the disturbance flow created by the presence of the sphere are treated separately. Proper account is taken of the effect of spatial variations of the undisturbed flow on both forces. In particular the appropriate Faxen correction for unsteady Stokes flow is derived and included as part of the consistent approximation for the equation of motion. (24 refs.)

66622 A two-equation turbulence model for two-phase flows. S.E.Elghobashi, T.W.Abou-Arab (Dept. of Mech. Engng., Univ. of California, Irvine, CA, USA).
Phys. Fluids (USA), vol.26, no.4, p.931-8 (April 1983).
A two-equation turbulence model has been developed for predicting two-phase flows. The two equations describe the conservation of turbulence kinetic energy and dissipation rate of that energy for the carrier fluid in a two-phase flow. They have been derived rigorously from the momentum equations of the carrier fluid. Closure of the time-mean equations is achieved by modeling the turbulent correlations up to third order. The new model eliminates the need to simulate in an ad hoc manner the effects of the dispersed phase on turbulence structure. Preliminary testing indicates that the model is successful in predicting the main features of a round gaseous jet laden with uniform-size solid particles. (33 refs.)

66623 A note on the Stokes resistance tensors of multiparticle systems in shear fields. S.Haber (Faculty of Mech. Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.246-52 (March 1983).
The Stokes resistance tensors (material tensors) of a multiparticle system subjected to a general shear flow depends on the spatial configuration of the particles, their shape, size and location of some arbitrarily fixed set of points locked to the particles by which their linear velocities are traced. The objective of the work is the determination of some symmetry properties of the material tensors and the transformation laws which govern them under translation of the set of points fixed to the particles. (8 refs.)

66624 Computer simulation of laminar dilute suspension flows in asymmetric pressure-driven membrane units. C.Kelinstreuer, M.S.Paller, T.P.Chin (Dept. of Chem. & Environmental Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.55-8 vol.3
A computer simulation model for steady laminar dilute suspension flow in a channel with one permeable wall has been developed. Reduced forms of the mass transport and momentum equation were solved simultaneously to study the effects of system parameters and transport mechanisms on permeation flux decline. Unique features of the model include: (1) the use of a subchanneling technique with which the strong coupling betwe en theequation of motion and the convection-diffusion equation is incorporated, (2) the asymmetry of the flow field, and (3) the fact that some of the boundary conditions are unknown a priori in the 'marching' routine. The computer simulation model is a useful tool for system investigations, sensitivity analyses and predictive case studies towards optimal design. (28 refs.)

66625 The effect of rate of expansion on the condensation of supersonic wet steam flow in a Laval nozzle. Yi-nian Cai, Yao Huang (Xi'an Jiaotong Univ., China).
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.254-61 vol.1
The authors present a summary of one aspect of the research work that has recently been done on the nucleation of condensing wet steam flow in an experimental Laval nozzle. By way of such a summary, it is possible to picture the outlook for further research in this direction which is very closely related to the development of nuclear power generation in China. (15 refs.)

66626 Pressure drop and flow characteristics of two-phase flow in porous media with distinct permeability regions. H.S.Lee, I.Catton (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA), H.L.Sullivan.
Thermal-Hydraulics of Nuclear Reactors. Second International Topical Meeting on Nuclear Reactor Thermal-Hydraulics, Santa Barbara, CA, USA, 11-14 Jan. 1983 (LaGrange Park, IL, USA: ANS 1982), p.904-9 vol.2
An experiment has been performed where the pressure drop and void fraction of two phase flow in a porous media have been measured. A multilayered structure of isotropic materials serves as the porous media. The beds of uniform glass spheres of different sizes are packed adjacently to give the regions different but uniform permeabilities. The experiment is modeling the degraded core in a nuclear reactor which could form following a severe accident. The pressure drop in such a two phase flow system is one of the primary concerns. The migration of vapor to a region of low permeability (or high permeability) could be very important in determining the coolability of the degraded core. For each porous media configuration, results are presented for the pressure drop as a function of superficial velocities of the fluids. The interplay of the distinct permeability regions on two-phase flow is observed and reported. (16 refs.)

66627 On the moisture movement in hygroscopically-porous material during the falling rate drying period. M.A.Kusumowardhoyo (Mech. Engng. Dept., Inst. of Technol. Bandung, Bandung, Indonesia).
Int. Commun. Heat & Mass Transfer (GB), vol.10, no.1, p.39-48 (Jan.-Feb. 1983).
A new concept of moisture transfer in hygroscopically-porous material during drying is proposed. The drying model developed gives simulation results which are in a very good agreement with experiments. (2 refs.)

66628 Collocation simulator for a system of coupled transport operators. V.V.Nguyen (Dept. of Civil Engng., Princeton Univ., Princeton, NJ, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.300, vol.2
Summary form only given, as follows. A mathematical description of the transport of chemicals in reactive porous media consists of a set of coupled quasilinear partial differential equations. This set of equations may be systematically decomposed into two kinds of operators and subsequently solved using an iterative collocation simulator. The associated standard error bounds are derived. The influence of the quasilinear terms upon the iteration scheme will also be investigated. (no refs.)

47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

66629 Flow of a stratified fluid in channels and pipes. V.P.Shidlovsky, L.I.Turchak (Computing Centre, Acad. of Sci., Moscow, USSR).
Arch. Mech. (Poland), vol.34, no.1, p.5-14 (1982).
A new derivation is presented for a set of equations describing the flow of viscous, heat conducting, salted and stratified fluid, based on the Boussinesq approximation. These equations are applied to study flows of stratified fluid in vertical channels and pipes, caused by thermal convection or pressure gradient. The effect of stratification results in appearance of a boundary layer. (11 refs.)

66630 Experimental determination of the random lump-age distribution in the boundary layer of the turbulent pipe flow using laser-Doppler anemometry. H.R.E.Van Maanen (Koninklijke/Shell Lab., Amsterdam, Netherlands), J.M.H.Fortuin.
Chem. Eng. Sci. (GB), vol.38, no.3, p.399-423 (1983).
Local velocities in the boundary layer of a fully-developed turbulent water flow in a horizontal, straight, smooth, 50 mm dia. tube were measured at 15, 20 and 30°C, and at $Re=5000$, $Re=9500$ and $Re=20000$ with a laser-Doppler velocimeter, accessory optics and a data processing system. Velocities in axial and radial directions at fixed positions near the wall were measured and their fluctuations were attributed to bursts and background turbulence. Each burst is considered as a spontaneous replacement of a liquid lump on the wall by a fluid entity from the bulk; background turbulence is considered as noise. For the velocity fluctuations in the axial direction an adequate procedure was applied to discriminate between bursts and noise. The values of a large number of time intervals between successively detected bursts were measured and presented in histograms. Further the time-averaged velocity

profile in the boundary layer and the velocity profile near the wall just after the moment that a burst occurs, were determined experimentally. (20 refs.)

66631 Secondary instability of plane channel flow to subharmonic three-dimensional disturbances. T.Herbert (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Phys. Fluids (USA), vol.26, no.4, p.871-4 (April 1983).
A linear secondary instability mechanism is presented that leads to the occurrence of subharmonic three-dimensional disturbances in wall-bounded shear flows. The instability originates from the periodic redistribution of vorticity in the shear flow by small but finite-amplitude Tollmien-Schlichting waves. Low threshold amplitudes and other characteristics of this instability are consistent with experiments and may elucidate various obscure observations. (17 refs.)

66632 Numerical studies on a confined channel flow. K.Murai, K.Ohta, M.Sasakura, M.Nakagawa, Y.Kawashima.
Rep. Himeji Inst. Technol. (Japan), no.35A, p.22-39 (1982). In Japanese.
The flow characteristics and flow pattern of two-dimensional confined channel have been studied. It is so difficult to obtain an analytical solution that a direct numerical solution of the Navier-Stokes equations in finite difference form for laminar flow is proposed under simplified conditions, and for turbulent flow, Reynolds stresses are assumed to be related to the mean strains by a scalar eddy viscosity, and numerical solutions are obtained. In a case of turbulent flow, the momentum equations, the equation which links the vorticity and the stream function, and that for the turbulent energy k are solved simultaneously in finite difference form. Finite difference equations are derived by integration of the fundamental differential equations over finite area. The flow patterns obtained by numerical calculation are in agreement with that of the experimental results. (5 refs.)

66633 An application of adjoint variational method to the capillary instability in liquid. Xu Shuochang (Inst. of Mech., Acad. Sinica, Beijing, China).
Sci. Sin. (China), vol.26, no.3, p.284-96 (March 1983).
Applying the direct variational approach of first-order approximation to the capillary instability problem for the cases of rotating liquid column, toroid and films on both sides of cylinder, the author obtains the necessary and sufficient conditions for motion stability of the 'cylindrical core-liquid-liquid-cylindrical shell' systems. The results obtained before are found to be special cases of the present investigation. The author has also explained the physical essence of rotating instability. (19 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

66634 MHD free-convection flow in the Stokes problem for a porous vertical plate by finite difference method. A.K.Singh (Dept. of Math., Banaras Hindu Univ., Varanasi, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.67-74 (Feb. 1983).
The flow past an infinite vertical isothermal plate started impulsively in its own plane in a viscous incompressible and electrically conducting fluid has been considered. The magnetic Reynolds number is assumed small so that the induced magnetic field can be neglected. The governing equations of the flow are solved by a finite-difference method when the Prandtl number is not equal to unity. The influence of the various parameters, entering into the problem, on the velocity field, the temperature field and on their related quantities is extensively discussed with the help of graphs and tables. (4 refs.)

66635 Motion of a fluid around a cylinder of any conductivity due to crossed magnetic and electric fields. P.Marty, A.Alemany (Inst. de Mecanique de Grenoble, Centre di Tri, Grenoble, France).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.227-43 (1983). In French.
Studies the perturbation due to the presence of an infinitely long cylinder, of any electrical conductivity, immersed in liquid metal subjected to a homogeneous magnetic field and an electric current which are perpendicular to each other. Calculations are made for three configurations: the cylinder is parallel (i) to the electric current, (ii) to the magnetic field, and (iii) to the force field. In this last case an induced flow around the obstacle appears. This flow is studied for asymptotic values of the Hartmann number, M. When $M \ll 1$, the flow, directed along the cylinder axis, is arranged in four cells of equal area. When $M \gg 1$, a singular perturbation technique is used and it is shown that the flow is also directed along the cylinder axis and is invariant in the direction of the magnetic field. In each case, the acting force is expresed as a function of the electrical conductivities of the fluid and of the obstacle. (15 refs.)

66636 Rayleigh-Taylor instability of a fluid supported against gravity by an oscillating magnetic field. B.B.Chakraborty (Dept. of Chem. Technol., Bombay Univ., Bombay, India), H.K.S.Iyengar, A.R.Hayak.
J. Math. Phys. (USA), vol.24, no.5, p.1326-31 (May 1983).
Rayleigh-Taylor instability of an incompressible, inviscid, and infinitely conducting heavy fluid supported against gravity by a horizontal and uniform magnetic field is studied. The magnetic field consists of a steady part and an unsteady part, of magnitude varying with time, rotating with a fixed period about a vertical axis. The growth rate of instability of any unstable disturbance is obtained analytically when the magnitude of the unsteady part of the field is small. When the unsteady part of the field is not small, the growth rate is calculated numerically. The analytical as well as the numerical results show that, except in some special cases, the steady and the unsteady field components together have greater stabilizing influence on the fluid than in the case when the unsteady field is acting alone. A physical explanation of the stabilizing influence of the combined presence of the steady and unsteady field is suggested. (14 refs.)

66637 Theory of an almost toroidal dynamo. E.P.Kropachev.
Magnetohydrodynamics (USA), vol.18, no.3, p.220-6 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.14-20 (July-Sept. 1982). [received: April 1983]
The kinematic theory of magnetic field production in the motion of a conducting liquid is based on examining the induction equation of magnetohydrodynamics with a given velocity field. The problem consists in elucidating what motion of the conducting liquid in a certain finite volume will give rise to a magnetic field that tends to zero at large distances but which does not vanish with the lapse of time. An approach is available for certain important classes of hydrodynamic motion in a conducting liquid such as almost axially symmetrical ones and small-scale turbulent gyrotropic motion. The author considers the generation of a magnetic field in a sphere when the main flow of the liquid is toroidal but there is no axial symmetry in the motion. Generation of a magnetic field is impossible for a purely toroidal motion (Bullard's antidynamo theorem). Minor radial deviations in the velocity can naturally give rise to conditions for magnetic field generation. The character of these conditions is examined. (4 refs.)

66638 Nonlinear self-excited oscillations in MHD flows. A.G.Bershadskii.
Magnetohydrodynamics (USA), vol.18, no.3, p.245-9 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.42-6 (July-Sept. 1982). [received: April 1983]
Recently acquired experimental data on the stability of shear MHD flows contradict the accepted theory of self-excited oscillations in a fluid. Both versions of the theory predict that the amplitude of self-excited oscillations will be proportional to $\sqrt{\delta}$, where δ is the supercriticality parameter. In experiments on the stability of shear MHD flows, however, a linear dependence of the amplitude on δ is obtained for small values of δ. The indicated theories well describe simple self-excited oscillations, but the investigation of coupled self-excited oscillations requires more realistic methods for their investigation. Such a method is proposed. For simple self-excited oscillations this method yields the same fundamental results as the conventional theories. For self-excited doublets the new method gives a linear dependence of the amplitude and frequency on the small supercriticality parameter. The conditions are determined for the existence of subcritical and supercritical self-excited doublets, and expressions are derived for calculating their amplitudes and frequencies. (7 refs.)

66639 Flow of an electrically conducting liquid in a pipe with a longitudinal magnetic field. L.G.Genin, T.E.Krasnoshchekova.
Magnetohydrodynamics (USA), vol.18, no.3, p.258-63 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.57-62 (July-Sept. 1982). [received: April 1983]
For flow in a longitudinal magnetic field, the Hartman effect related to the flattening of the average velocity profile is absent and the only effect stemming from the action of the magnetic field on the flow is suppression of turbulent pulsations. In addition, the hydraulic resistance and heat transfer also decrease. There are a large number of computational-theoretical papers in which available experimental data are used to construct semiempirical models of turbulent MHD flows. However, until now, the available experimental data have not been carefully compared and generalized. The authors attempt such a generalization. Based on a single dependence for the coefficient of turbulent diffusion of momentum, they were able to describe with good accuracy the available experimental data on velocity profiles and drag for flow of an electrically conducting fluid in a longitudinal magnetic field. (10 refs.)

66640 Experimental studies of electroconvective motion in transformer oil. A.I.Fedonenko, A.I.Zhakin.
Magnetohydrodynamics (USA), vol.18, no.3, p.272-6 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.74-8 (July-Sept. 1982). [received: April 1983]
Experimental data is presented on development and kinematic characteristics of electrical convection over a wide range of intensity of the external electric field (from uniform to strongly nonuniform) in a liquid dielectric with varying electrical conductivity. (13 refs.)

66641 EHD-flow in system with mutually parallel shells. Yu.K.Stishkov, A.A.Ostapenko, N.A.Chistyakov.
Magnetohydrodynamics (USA), vol.18, no.3, p.277-80 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.79-83 (July-Sept. 1982). [received: April 1983]
Study of EHD flow in systems with mirror-symmetric electrodes is of profound scientific interest, since it would in a clear manner reveal the basic characteristics of EHD flow modes, their polar diversities and their dependence on the electrophysical properties of the medium. The author presents results of an experimental study of EHD flow in a system with 'wire-wire' electrodes. The main experiments were performed in a vessel made of acrylic glass. In a similar vessel, but with through passage, was studied the development of straight-through flow. (2 refs.)

66642 Dielectrophoretic motion of bubbles in liquid. A.B.Isers.
Magnetohydrodynamics (USA), vol.18, no.3, p.280-3 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.83-6 (July-Sept. 1982). [received: April 1983]
One of the problems under conditions of near weightlessness is removal of gaseous inclusions from liquid fuel. Inasmuch as most working liquids are liquid dielectrics, it maybe possible to remove bubbles by means of a nonuniform electric field. The polarization forces appearing due to difference between the dielectric permittivity of the liquid and that of the gas produce a so-called dielectrophoretic motion of bubbles in the liquid. Since under real conditions clusters of bubbles are to be removed, it is worthwhile to examine the interaction between bubbles upon application of an electric field and, first

of all, pairwise interaction. Such interaction is the object of the study. (4 refs.)

66643 Compensation of induced magnetic fields at high magnetic Reynolds number. A.M.Anisimov, V.F.Vasil'ev, I.V.Lavrent'ev.
Magnetohydrodynamics (USA), vol.18, no.3, p.299-304 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.105-10 (July-Sept. 1982). [received: April 1983]
As the magnetic Reynolds number ($N_{Re,m}$) increases, the efficiency of various MHD devices (generators, pumps, throttles, flow meters) decreases appreciably because of the negative effect of the magnetic fields of currents induced in the channel. Various methods of compensating these induced fields have been proposed for reducing this effect. The most widely adopted one is use of a return current conductor or a two-channel (bifilar) MHD device with two identical channels inside the gap of the magnet system, where the working medium as well as the electric current flow in opposite directions. It has been demonstrated on the basis of two-dimensional theory that compensation by means of a return current conductor in a channel without barriers is ineffective: as$N_{Re,m}$ increases, the electrical power delivered by a generator channel and the mechanical power delivered by a pump channel decrease appreciably, even though the maximum attainable electromagnetic efficiency of the channel remains at the same level as $N_{Re,}=Re_m$ in the noninductive approximation ($N_{Re,m}=0$). A bifilar device, on the other hand, is assumed to provide full compensation and the characteristics of its channels are described by the inductionless theory. This is not so and a bifilar device is not one ensuring full compensation of induced magnetic fields. Furthermore, an increase of $N_{Re,m}$ is accompanied by a decrease of the resultant magnetic field within the active zone under the inductor, the amount of this decrease becoming larger as the magnet system is made shorter. This effect is closely linked to the three-dimensionality of the electromagnetic field distribution and its rigorous description is possible only with a solution to the three-dimensional problem. (6 refs.)

66644 Evaluation of MHD-processes in saline coolants. A.D.Votsish.
Magnetohydrodynamics (USA), vol.18, no.3, p.322-5 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.129-32 (July-Sept. 1982). [received: April 1983]
The main problem in the design of heat exchanger systems based on liquid coolants in a strong magnetic field (6-8 T) is, from the MHD standpoint, determining the decrease of hydraulic pressure drop and the increase of heat transfer in streams of conducting liquids in magnetic fields. An examination of designs of such systems reveals an appreciable effect of a magnetic field on the stream of liquid. In one design, for instance, the pressure drop can vary over a range of six orders of magnitude from 0.1 to 10^5 N/cm^2, depending on the channel geometry and the channel position in the magnetic field as well as on the electrical conductivity of the channel walls. Turbulent flow offers advantages over laminar flow, from the standpoint of intensifying the heat transfer, but also involves larger pressure losses. Transition to turbulent flow in a channel of rectangular cross section or in a pipe of circular cross section with smooth walls occurs at a Reynolds number of the order of $Re \geq Re_{cr}=2300$. As the magnetic field strength is increased, in terms of the Hartmann number, the critical Reynolds number also increases. In a transverse magnetic field, for instance, a change of the Hartmann number from 10 to 1000 will cause the critical Reynolds number to increase within the 6×10^3-6×10^6 range. In heat exchangers with liquid-metal coolants, therefore, laminarization of the stream is possible at high values of the Reynolds number. The pressure loss in such a mode of MHD flow is much smaller than in a turbulent mode. (16 refs.)

66645 A variational principle for surface waves in magnetohydrodynamics. B.K.Shivamoggi (The Australian Nat. Univ., Canberra, Australia).
Q. Appl. Math. (USA), vol.41, no.1, p.31-3 (April 1983).
A variational principle for the motion of the interface between an infinitely conducting fluid and a vacuum magnetic field is given. This variational principle not only gives the Laplace equation governing the velocity potential and the magnetic-field potential, but also provides all the boundary conditions appropriate to the interface between an infinitely conducting fluid and a vacuum magnetic field. However, unlike the hydrodynamical case, this variational principle does not have the simple physical interpretation of the stationarity of the fluid pressure+magnetic field pressure. (5 refs.)

66646 Flow of liquid cathodes in three-dimensional magnetic fields. A.A.Kostin, V.I.Eberil'.
Sov. Electrochem. (USA), vol.18, no.6, p.625-33 (June 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.6, p.707-15 (June 1982). [received: Feb. 1983]
Motion of a liquid cathode is examined as open-channel flow of an electrically conducting liquid without any pressure head which is brought about by the simultaneous action of body forces and electrodynamic forces that are generated in the cathode by the magnetic field of the electrolyzer and by the currents flowing in the cathode. For increasing unit power of the electrolyzers, electrodynamic forces begin to play a significant part in shaping the flowing cathode. Calculations are presented, both of the flow thickness in different sections of cathode surface (allowing for the effect of electrodynamic forces) and of the average increase in electrode gap caused by the change in cathode profile. (8 refs.)

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

66647 Numerical solution of the two-dimensional equations of laminar flame propagating down a cylindrical tube. S.L.Aly (Dept. of Mech. Power, Cairo Univ., Giza, Egypt).
Appl. Math. Modelling (GB), vol.7, no.2, p.119-22 (April 1983).
A system of premixed laminar flame freely propagating, at constant pressure, down a cylindrical tube, having constant cool wall temperature, is formulated and solved numerically. Single step Arrhenius kinetics and average transport properties are used for a simulated propane-air mixture. The solution method is based on linearizing the nonlinear terms in the equations, using the Picard method, and solving line by line to cover the integration field. Iteration then proceeds with varying degrees of underrelaxation until convergence is obtained. The solution yields the flame speed and structure at any tube diameter. The flame structure reveals the wall cooling effect on the flame at various diameters. (12 refs.)

66648 Operator splitting methods for the computation of reacting flows. J.B.Greenberg (Dept. of Aeronautical Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Comput. & Fluids (GB), vol.11, no.2, p.95-105 (1983).
If the modeling of the chemistry of a reacting flow system is to consider more than a simple, one-step, global reaction the attainment of a numerical solution of the relevant governing equations is generally jeopardised by the problem of stiffness. A general approach to overcoming the stiffness hazard is presented. It makes use of operator-splitting techniques, the novel feature being that splitting of the chemical source terms themselves is permitted, with the aid of a new chemical splitting parameter. For the case of elliptic flow with a unimolecular reversible chemical reaction a convergence analysis provides an insight into the conditions under which a converged solution will be obtained. The existence of an optimum value of the chemical splitting parameter indicates the possibility of accelerating convergence. Finally, calculated results for some test problems, involving linear and nonlinear chemical kinetic models, illustrate the viability and usefulness of methods based on the new approach. (14 refs.)

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

66649 Multiprocessor computer modeling of transonic flow. A.V.Sherstyuk.
Autom. & Remote Control (USA), vol.43, no.8, pt.2, p.1099-104 (Aug. 1982). Translation of: *Avtom. & Telemekh. (USSR)*, vol.43, no.8, p.152-7 (Aug. 1982). [received: April 1983]
A problem encountered in experimental aerodynamics at transonic velocities is the elimination of the distorting influence of the walls of the wind tunnel on the gas flow in it. The methods proposed for the solution of this problem by controlling the boundary conditions at the tunnel walls entail, as an integral part of the problem, the modeling of transonic flow on a time scale consistent with the experiment. In this article the author proposes a method for the modeling of steady transonic flow, specifically tailored for implementation on a multiprocessor computer, and describes the first results of its implementation on the PS-2000 matrix-type computer system. The modeling problem applied to highly disturbed flow near an obstructing body is discussed. (9 refs.)

66650 Explosion-driven shock tubes (review). V.B.Mintsev, V.E.Fortov (Inst. of Chem. Phys., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.623-45 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.745-64 (July-Aug. 1982). [received: April 1983]
The authors examine the characteristic designs of explosion-driven shock tubes used in experimental physics, the methods for calculating their parameters, the gasdynamics possibilities for such apparatus and the methods of diagnostics, and discuss new directions in research. The schemes for linear and cumulative explosion driven tubes, explosion systems using gradient acceleration and an explosion-driven generator of rectangular pulses, and large-scale explosion installations are presented. The results of experiments are discussed on determining the radiative properties of shock waves in gases by investigating the nonideal plasma generated by the explosion, problems of high-velocity hurling, thermal working of material surfaces, and the use of explosion-driven shock tubes for transforming kinetic energy into electrical energy. (100 refs.)

66651 A sensor for flow measurements near the surface of a compressor blade. P.M.Ligrani, B.R.Gyles, K.Mathioudakis, F.A.E.Breugelmans (Von Karman Inst. for Fluid Dynamics, Rhode-St-Genese, Belgium).
J. Phys. E (GB), vol.16, no.5, p.431-7 (May 1983).
A sensor consisting of two parallel hot wires operating as a thermal tuft has been developed for flow measurements near the surface of an axial flow compressor blade rotating at 1000 rpm. Calibration characteristics of the probe, presented for different velocities, yaw angles and pitch angles, together with baseline measurements during compressor operation, show that the ratio of the effective velocities from wires indicates when the flow near a surface moves in a nominal downstream direction and when it does not. The percentage of time that the flow is well behaved, the magnitude of velocity fluctuations and autocorrelation functions are presented for different compressor operating conditions. The general utility of the sensor is demonstrated. (23 refs.)

66652 The spatial filtering effect of capacitance transducer electrodes [flow measurement]. E.A.Hammer, R.G.Green (Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Phys. E (GB), vol.16, no.5, p.438-43 (May 1983).
Capacitance sensors are finding increased application in the measurement of two-component flow. An important parameter in these measurements is the frequency bandwidth of the ring and parallel plate types of sensing electrodes. In this paper the theoretical response of these electrodes to permittivity impulse signals is derived and compared with experimental data. A machine is used to drive a plastic bead through both types of electrode to obtain the impulse response for comparison with theoretical predictions. Experimental results are presented for beads travelling along the central axis of the sensor and near to its wall. For electrodes with an active length greater than 40 mm theory and experiment agree, for shorter lengths an electrode length coefficient is introduced. This gives the minimum effective length of this type of electrode as 30 mm, which is attributed to field fringing effects. (6 refs.)

66653 Couette viscometry of Casson fluids. R.W.Hanks (Dept. of Chem. Engng., Brigham Young Univ., Provo, UT, USA).
J. Rheol. (USA), vol.27, no.1, p.1-6 (Feb. 1983).
The solution of the equations of motion for a Casson model non-Newtonian fluid in a rotational Couette viscometer is presented. Proper equations for determination of rheological parameters from data obtained from commercial viscometers are derived and presented. Sample curves illustrating the influence of viscometer geometry on the rheogram are presented. (10 refs.)

66654 Turbine meters for liquid measurement. B.A.Ellison (Brooks Instrument Div., Emerson Electric Co., Statesboro, GA, USA).
Mech. Eng. (USA), vol.105, no.2, p.52-6 (Feb. 1983).
Gives a look at the effect of viscosity on turbine meter range and accuracy including types of meter outputs, principles of operation, effects of specific gravity, installation techniques, and applications. (no refs.)

66655 Viscometry of a magnetic fluid in weak fields. N.I.Ivanova, B.E.Kashevskii.
Magnetohydrodynamics (USA), vol.18, no.3, p.226-30 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.21-6 (July-Sept. 1982). [received: April 1983]
At present there are no reliable experimental data on the magnetoviscous effect in magnetic fluids in the region of weak magnetic fields, whose strength satisfies the relationship $\xi = mH/kT \leq 1$, where m is the magnetic moment of the ferroparticle, k is the Boltzmann constant, and T is the absolute temperature. The weak-field region is interesting in that it clearly reveals such important properties of the magnetic fluid as the superparamagnetism of small ferromagnetic particles (their spontaneous magnetic reversal), and also their dipole-dipole particle interaction. For instance, depending on whether the superparamagnetism is weak or pronounced, the law of increase of viscosity with field in the region $\xi \ll 1$ varies from ξ^2 to ξ^4. Reliable data in the weak-field region can be obtained by studying the behavior of resonant oscillatory systems containing magnetic fluids, in which small changes in viscosity can lead to considerable effects. (5 refs.)

66656 High viscosity (10^4-10^{11} Pa.s) measurements by the penetrometer method at low temperature (77-300K). A.Bondeau (Lab. des Dielectriques Liquides, Univ. Lyon I, Villeurbanne, France), J.Huck.
Rev. Phys. Appl. (France), vol.18, no.5, p.307-12 (May 1983). In French.
The authors have produced a cylindric penetrometer in order to measure Newtonian liquids shear viscosity between 10^4-10^{11} Pa.s and 77-300K. Measurements of the penetration depth $h(t)$ by means of an electromagnetic displacement captor are recorded on a magnetic memory and treated by a desktop computer. The variations of $h^2(t)$ are linear according to the theory. The viscosity values of phenyl salicylate measured by this penetrometer agree with the data of Laughlin and Uhlmann obtained by beam bending method. (25 refs.)

66657 Flowmeter. H.Nakane (Toshiba Corp., Kawasaki, Japan).
Refrigeration (Japan), vol.57, no.661, p.1123-36 (Nov. 1982). In Japanese.
Various types of flow transducers (meters) are commercially available. Flow transducer accuracy is affected not only by the properties of the stream, but also by the inherent characteristics of the transducer itself. The transducing principle, features, specifications, calibration and typical applications are briefly described of electromagnetic meters, ultrasonic flowmeters and venturi meters. Electromagnetic meters are now widely accepted. It is necessary that the fluid be a conductor of electricity, and this has limited their applications. One of the more interesting applications is on slurry measurements, a difficult task for most meters. Ultrasonic flowmeters are advertised as good for corrosive fluids. Venturi meters are widely used in various water and stream applications. (4 refs.) *K.B.*

66658 Measurement of the velocity of axisymmetric laminar flow by an optical visualisation technique with coherent light. C.Philippe (Lab. de Phys. & Mecanique des Fluides, Univ. de Poitiers, Poiters, France).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.137-53 (March 1983).
An optical technique, based on holography, for measuring the distribution of velocities inside a laminar flow of a transparent liquid is described. A suspension of micro-sized scattering particles in the fluid is illuminated by a coherent light sheet from a doubly pulsed ruby laser. By temporal integration on a photographic plate of the interference patterns between the two scattered fields and two successive reference fields successively, the authors get a double exposure hologram of the two successive maps of scatterer distribution. The displacement of the scatterers during the time separating the two laser pulses is measured by observation of the real holographic image through a microscope. They report experimental results about two cases of axisymmetrical flow—confined in a circular pipe, then free jet out of the pipe—for several values of the hydrodynamic parameters. (21 refs.)

66659 Instrument for measuring dynamic surface tension. A.Kukkonen, J.Nummipuro, J.Virtanen.
Report 140, Tech. Res. Centre Finland, Electr. Eng. Lab., Espoo (Jan. 1983), 32 pp.
An instrument was constructed for measuring the dynamic surface tension of water solutions by the oscillating jet method. The values of the surface tension as a function of the surface age are calculated by inserting into Bohr's equation the wave parameters, density of the liquid and flow rate of the jet. The jet is formed by hydrostatic pressure through an elliptical orifice. The cross section of the standing wave in the jet is scanned by an image sensor, from which the results are fed to a microcomputer for computing and display. The reproducibility of the measurement is better than 3% for the age range 0.8-20 ms. The practical measurements made so far support earlier research results, which suggest that the surface tension is a function of the surface age. (10 refs.)

51.10 KINETIC AND TRANSPORT THEORY

66660 The application of a modified form of the S_N method to the calculation of swarm parameters of electrons in a weakly ionised equilibrium medium. P.Segur (Centre de Phys. Atomique, Univ. Paul Sabatier, Toulouse, France), M.-C.Bordage, J.-P.Balaguer, M.Yousfi.
J. Comput. Phys. (USA), vol.50, no.1, p.116-37 (April 1983).
A numerical method is developed for the solution of the Boltzmann equation in order to calculate the swarm parameters of a weakly ionised gas. Then it is shown how these experiments can be simulated by calculation in order to explain the discrepancies observed between the parameters measured under the same conditions but in different experiments. The present method of solution which uses both Lesaint's S_N method and an iterative process based on the so-called Eddington factor. (26 refs.)

51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

66661 Longitudinal diffusion coefficients and test of the generalized Einstein relation for Tl^+ ions in Kr and Xe, Li^+ in Kr and Xe, and Cl^- in N_2. M.G.Thackston, M.S.Byers, F.B.Holleman, R.D.Chelf, J.R.Twist, E.W.McDaniel (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4781-2 (1 April 1983).
Since it is considerably more difficult to measure diffusion coefficients of gaseous ions than to measure their mobilities, it is convenient to have a means of calculating the former from the latter. Most methods for determining diffusion coefficients from mobilities employ empirical ad hoc correction factors; however, Waldman and Mason (1981) have derived generalized Einstein relations (GER) from the Boltzmann equation within the framework of a three-temperature kinetic theory. The authors compare longitudinal diffusion coefficient (D_L) values calculated (using the Waldman-Mason GER) from their previously reported mobility values, with experimentally measured D_L values for Tl^+ in Kr and Xe, Li^+ in Kr and Xe, and Cl^- in N_2. These measurements were made with a drift tube mass spectrometer at a gas temperature of 300K and gas pressures ranging from 0.030 to 0.400 Torr. No significant clustering of ions to the drift gas molecules was observed. (7 refs.)

51.30 THERMAL PROPERTIES OF GASES

66662 Thermodynamic functions of diatomic selenium. N.F.Vendrikh, S.I.Gorbov, A.S.Pashinkin (Moscow Inst. of Electronic Equipment, Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.921-5 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1087-92 (July 1982). [received: Feb. 1983]
Statistical thermodynamics methods have been used in performing an accurate calculation of the thermodynamic functions of selenium in the state of an ideal diatomic gas at 100-3000K. Approximation equations have been obtained for the heat capacity and enthalpy. The discrepancies between these and previous calculations have been analyzed. The new values obtained for the thermodynamic functions give the best agreement with the spectroscopic value of the dissociation energy of the Se_2 molecule. Starting with the value of $D_0(Se_2)$, by means of a calculation based on the third law of thermodynamics, a more accurate value has been obtained for the energy of excitation of the unobserved $a^1\Delta_g$ electronic state of the Se_2 molecule. (10 refs.)

66663 Composition of the gas phase in the Cd-Te-N-H-I system. Yu.G.Akhromenko, G.A.Il'chuk, S.P.Pavlishin, S.I.Petrenko (Lenin Komsomol Lvov Polytech. Inst., Lvov, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.944-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1117-22 (July 1982). [received: Feb. 1983]
The Cd-Te-N-H-I closed system was subjected to thermodynamic analysis, and the equilibrium partial pressures of the components of the gas phase at 700-1100K and total pressures from 1.01×10^3 to 1.01×10^5 Pa were calculated. The range of the growth of CdTe single crystals and epitaxial layers was established by the method of chemical-transport reactions by comparison of the calculated data with the Te_2 pressure above liquid tellurium and CdTe. 66664 Anisotropic velocity distribution representation of the electron swarm in a weakly ionized gas. T.Makabe, T.Mori (Faculty of Engng., Keio Univ., Yokohama, Japan).
Trans. Inst. Electr. Eng. Jpn. Sect. E (Japan), vol.102, no.11-12, p.101-8 (Nov.-Dec. 1982). [received: April 1983]
Describes the anisotropic velocity distribution function of the electron swarm in weakly ionized gases from the three-term spherical harmonic expansion technique of the Boltzmann equation, and a method for solving the coupled

integro-differential equations for the electron distribution functions. In the method for solving the equations, the authors employ a numerical technique using the implicit Gear's algorithms. Important advantages of using such a numerical technique in the present system are efficiency to solve the stiff equations stably, and appropriateness for obtaining a solution of the equations with poor initial conditions. This analysis is applied to the steady-state electron swarm in helium. Comparative calculation with the conventional two-term Lorentz approximation shows that, not only at higher E/N, but even at low E/N, subject to almost spherically symmetric velocity distribution, this procedure gives the results with sufficient accuracy. Also the swarm characteristics in helium are discussed from a viewpoint of the anisotropic velocity distributions. (33 refs.)

66665 Electron thermalization in gases. B.Shizgal (Dept. of Chem., Univ. of British Columbia, Vancouver, British Columbia, Canada).
J. Chem. Phys. (USA), vol.78, no.9, p.5741-4 (1 May 1983).
The energy relaxation of energetic electrons is determined with a moment method solution of the hard sphere Lorentz-Fokker-Planck equation. The convergence of the expansion of the electron speed distribution function in speed polynomials is rapid and the energy relaxation can be written explicitly as a sum of a small number of exponential terms characterized by the lowest eigenvalues of the Lorentz-Fokker-Planck equation. The decay of the directed velocity is examined with a discrete ordinate method. The rate of convergence vs. the number of quadrature points is extremely rapid and for particular values of the initial electron energy, an exact result can be obtained. (11 refs.)

66666 Electron mobility in gases at low temperatures: the quantum mechanical Lorentz gas. I. T.R.Kirkpatrick (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), J.R.Dorfman.
J. Stat. Phys. (USA), vol.30, no.1, p.67-106 (Jan. 1983).
The zero-field mobility of electrons in dilute gases at low temperatures is studied. The authors consider the case where the de Broglie wavelength of the electron is large enough that the mobility calculation must be formulated using quantum mechanical kinetic theory. The electron mobility is then computed as a function of the gas density with the approximation that the gas is considered as a collection of fixed scatterers. They evaluate the first two terms in the density expansion of the mobility, and compare these results with experiments. (16 refs.)

66667 Influence of nonlinear frequency mixing on multiphoton ionization of gases. Yu.I.Geller, A.V.Shvabauskas.
Opt. & Spectrosc. (USA), vol.53, no.3, p.227-8 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.385-7 (Sept. 1982). [received: May 1983]
The possibility of significant increase or decrease in the probability of ionization of the medium on account of the process of nonlinear frequency mixing is shown, which is necessary to take into account in an experiment and may be used to control ionization of gases. (6 refs.)

66668 Electron diffusion and the Einstein relation in high-density gases. T.F.O'Malley (General Electric Co., San Jose, CA, USA).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.32-4 (11 April 1983).
A model which used multiple-scattering theory to derive the density dependence of thermal electron mobilities, is employed to do the same for the diffusion coefficient. A surprising consequence of this is that the thermal Einstein relation is not the simple expression that is generally written and never verified, but rather one that depends on the density. (10 refs.)

51.60 MAGNETIC PHENOMENA IN GASES

(for liquids, see 75.)

66669 Magnetic properties of a diamagnetic gas in a resonance radiation field. B.A.Glushko, V.O.Chaltykyan (Inst. of Phys. Res., Acad. of Sci., Ashtarak, Armenian SSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1388-90 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2135-9 (Nov. 1982). [received: May 1983]
An investigation is made of the change in the magnetic properties of a diamagnetic molecule (atom) induced by a resonance optical radiation field. Calculations are made for the $0 \rightarrow 1$ molecular transition in the presence of an external magnetostatic field. Expressions are derived for the magnetization and the magnetic susceptibility of the molecule, which depend nonlinearly on the light wave intensity, in the case of longitudinal and transverse directions of the external magnetic field with respect to the direction of propagation of the radiation. It is shown that the field-induced nonlinear magnetic susceptibility of a diamagnetic substance can change sign and increase considerably (by several orders of magnitude compared with the linear diamagnetic susceptibility). The field-induced nonlinear magnetization of the substance does not depend on its magnetic properties and is the same for diamagnetic and paramagnetic substances. (8 refs.)

51.70 OPTICAL PHENOMENA IN GASES

(for liquids, see 78.)

66670 Coherent anti-Stokes Raman spectroscopy of water vapor of combustion diagnostics. R.J.Hall, J.A.Shirley (United Techols. Res. Center, East Hartford, CT, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.196-202 (March-April 1983).
The coherent anti-Stokes Raman spectroscopy spectrum of H_2O was measured in a heated optical cell and in laboratory flames. Comparisons of the experimental spectra with a theoretical model were used to infer information about the unknown Raman linewidths of H_2O. In the test cell, excellent agreement was obtained between theory and experiment in terms of physically realistic linewidths. Agreement between experiment and theory in laboratory flames was also good. (34 refs.)

66671 Detection of the Faraday rotation produced by a gas inside a Michelson interferometer. M.Pinard, L.Julien, F.Laloe (Lab. de Spectroscopie Hertzienne, ENS, Paris, France).
J. Phys. (France), vol.44, no.5, p.589-95 (May 1983).
The authors discuss a method allowing one to increase the rotation of the plane of polarization of an optical beam, produced when it crosses a circularly birefringent gas (e.g. optically pumped gas). The cell containing the gas is inserted inside one of the arms of a Michelson interferometer, the path difference being adjusted so that almost all the optical intensity is reflected backwards; if the weak beam, which is deflected at right angle by the interferometer, is detected, an enhanced rotation of the plane of polarization can be observed. After a short general discussion of this effect, they report a few experiments on optically pumped metastable Ne atoms where the effect has been seen. Enhancements of the rotation of the plane of polarization by a factor 30 have been measured. (7 refs.)

66672 Scattering of light by an intense saturating pulse in a resonance medium. V.I.Rupasov (Inst. of Spectroscopy, Acad. of Sci., Troisk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1383-7 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2127-34 (Nov. 1982). [received: May 1983]
A linear response of a resonant medium to a weak electromagnetic field is studied in the case when a medium is a gas of three-level atoms subjected to a strong saturating pulse. A noncoherent intense pulse and a coherent 2π pulse (of the kind encountered in the theory of self-induced transparency) are considered. The expressions obtained are used to study the problem of the spectrum of the reflection of light by a pulse moving in a medium. An analysis is made of the possibility of using the Doppler effect, which occurs when light is reflected by a moving pulse, in an investigation of the characteristics of pulse propagation, determination of its parameters, and study of the nonlinear characteristics of the medium itself. Possibilities of experimental observation of the predicted effects are discussed, particularly the possibility of conversion of an electromagnetic radiation spectrum. (13 refs.)

66673 Investigation of coherent emission in time-separated fields. L.S.Vasilenko, N.N.Rubtsova (Inst. of Heat Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1457-60 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2243-8 (Nov. 1982). [received: May 1983]
An investigation was made of signals of coherent radiation generated by time-separated fields in an SF_6 gas at moments $t=T+nT(n=1,2,3,4)$ under the action of two pulses of standing-wave CO_2 laser radiation. The amplitudes of such signals were investigated as a function of the detuning of the laser frequency relative to the center of the transition line of SF_6, as a function of the amplitude of the exciting radiation and also as a function of T. The rates of relaxation of the polarization, $\gamma_{12}=(46\pm5)\times10^6$ $sec^{-1}.Torr^{-1}$, and of the populations, $\gamma(42\pm4)\times10^6$ $sec^{-1}.Torr^{-1}$, were found at pressures of 1-5 (mTorr). A comparison of γ_{12} and γ gave information on the nature of collisions in the SF_6 gas. (16 refs.)

52.00 THE PHYSICS OF PLASMAS AND ELECTRIC DISCHARGES

(for solid-state plasma, see 72.30)

52.20 ELEMENTARY PROCESSES IN PLASMA

66674 Linear theory of a cold bounded plasma. O.M.Gradov (Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR), L.Stenflo.
Phys. Rep. (Netherlands), vol.94, no.3, p.111-37 (Feb. 1983).
The linear dispersive properties of the electron surface waves of a bounded plasma are considered by means of the cold fluid theory. Wave dissipation due to resonant absorption as well as leaking processes are discussed. A general method is introduced to describe the eigenmodes of a plasma with arbitrary boundary shape. A hydrodynamic fluctuation theory, which can be useful for plasma diagnostics, is also presented. By means of the eigenmode theory the authors then discuss total absorption of plasma radiation as well as superreflectivity processes. (54 refs.)

66675 The effect of Debye screening on the ion-ion recombination rate. I.S.Lakoba, Yu.I.Syts'ko, E.D.Yakubtseva.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.22-6 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.26-31 (1982).
The known method for the calculation of the recombination coefficient for ions with opposite charges in the presence of a neutral particle, is generalized to the case when the plasma screening of their electrostatic potential becomes important. Results of the calculations are given. (2 refs.)

66676 Behaviour of population in a plasma interacting with an atomic gas. U.Furukane, T.Oda.
Report IPPJ-622, Nagoya Univ., Japan (Jan. 1983), 33 pp.
The processes leading to population inversion are investigated in a recombining hydrogen plasma which is interacting with a cool and dense neutral hydrogen gas by using the rate equations on the basis of the CR model and the energy equation for electrons, ions and neutral particles. The quasi-steady state approximation is used only for the levels higher than a certain level which is not the first excited level. The calculations show that the quasi-steady state cannot be realised while intense energy-flows due to the collisional processes exist between different kinds of the particles such as the electrons and the ions in the plasma and population inversion is realised only in the quasi-steady state following the transient phase. The effects of the initial conditions of the hydrogen plasma and the introduced neutral hydrogen gas on the over population density are also discussed. (18 refs.)

52.25 PLASMA BASIC PROPERTIES

66677 Extended standard vector analysis with applications to plasma physics. H.K.Wimmel (Max Planck Inst. fur Plasmaphys., Garching, Munchen, Germany).
Eur. J. Phys. (GB), vol.3, no.4, p.223-9 (1982).
Standard vector analysis in three-dimensional euclidian space, as found in most tables and textbooks, is complemented by a number of basic formulae that seem to be largely unknown, but are important in themselves and for practical applications. This is demonstrated by examples from theoretical plasma physics. (22 refs.)

66678 On the thermodynamics of the two-dimensional jellium. S.Johannesen (Matematisk Inst., Univ. Oslo, Blindern, Oslo, Norway), D.Merlini.
J. Phys. A (GB), vol.16, no.7, p.1449-63 (11 May 1983).
Considers the two-dimensional classical jellium in a circular domain. Using a careful extrapolation method of the exact results for systems with a small number of particles (N=1, 2, 3, 4), the authors obtain an estimate of the free-energy density and the kinetic pressure in the thermodynamic limit for some discrete values of the plasma parameter $2\leq\gamma\leq14$. An ansatz for the free-energy density is then constructed which is in good agreement with the theoretical estimation and the numerical results of a recent Monte Carlo simulation of the system. A similar agreement is obtained for the kinetic or virial pressure. (28 refs.)

66679 Thermal relaxation and entropy for charged particles in a heat bath with fields. A.J.M.Garrett (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
J. Phys. A (GB), vol.16, no.7, p.1505-16 (11 May 1983).
The relaxation back to thermal equilibrium of one very dilute species of charged particle in a heat bath of different neutral particles, with which they collide elastically, is considered by means of the Boltzmann equation for the one-particle distribution function of the test particles. The Boltzmann collision integral is used to describe the collisions. A rigorous proof that relaxation to thermal equilibrium will always take place, even in the presence of a magnetic field, is given, initially for the case when there is no spatial dependence. The proof is based on a functional of the distribution function with properties similar to the Boltzmann entropy. This quantity is shown always to decrease until thermal equilibrium is reached, and to be bounded below by its value in thermal equilibrium. The proof is then generalised to allow for arbitrary spatial dependence of the magnetic field and the initial distribution function. (13 refs.)

52.25F Transport properties

66680 A scaling law for the anomalous electron transport in Tokamaks. Zhang Yang-Zhung (Southwestern Inst. of Phys., Leshan, Sichuan, China).
Acta Phys. Sin. (China), vol.32, no.2, p.191-7 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
It is assumed that the dominant mechanism for the anomalous electron transport in Tokamaks is the renormalized electron magnetic drift wave driven by temperature gradient. A scaling law for the anomalous electron transport coefficient $D^{(T)}$ has been derived by solving self-consistently the kinetic process, it reads $D^{(T)}=(c/\omega_{pc})^2\{\sqrt{(\nu_e/qR)^2/2\pi+(\nu_c/2)^2}-\nu_c/2\}$. It coincides in numerical values with the Alcator scaling law given by the Tokamak's experiments, and it agrees with the ohkawa scaling law in the collisionless limit ($\nu_c\rightarrow0$). Furthermore, its deviation from the Alcator scaling law is analyzed, and the possibility of achieving the thermonuclear ignition for a high-field ohmically heating Tokamak is also discussed based on the scaling law. (20 refs.)

66681 Bremsstrahlung rates in fully ionized gases in a magnetic field. S.Imazu, J.Irisawa, S.Takano (Dept. of Electrical Engng., Technol. Univ. of Nagaoka, Nagaoka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1224-9 (April 1983).
The bremsstrahlung rates in fully ionized gases in a magnetic field are theoretically investigated. Here it is assumed that the charged particles have Maxwell velocity distributions, and that an external electric field does not exist. In the theoretical treatment, the following points are considered: when the Larmor radius is larger than the radius of the collisional cross section due to the bremsstrahlung, the radiation of energy during a short time at an instant of the collision is not affected by the magnetic field. However, according to the gyration, the relative velocity between an electron and a colliding ion during the free path is affected by the magnetic field strength. Numerical calculations show that the bremsstrahlung rate in the presence of the magnetic field is smaller than that in the absence of the magnetic field. (9 refs.)

66682 Radial motion of a field-reversed ion layer. A.Ishida, K.Kitao (Dept. of Phys., Niigata Univ., Niigata, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1251-4 (April 1983).
Radial motion of a field-reversed ion layer is investigated theoretically in the limit of an extremely field-reversed thin layer. It is assumed that the ion layer consists of a fluid of rigidly rotating ions with finite temperature and a fluid of cold stationary electrons. The ion layer radially vibrates as a whole with a frequency nearly equal to the betatron frequency of a single ion.

66683 Spatial diffusion of charged high-energy fusion products by shear Alfven perturbations. F.Pegoraro, L.Sugiyama (MIT, Cambridge, MA, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.407-23 (April 1983).
The interaction between shear Alfven perturbations and the charged high-energy particles produced by fusion reactions is investigated. The aim is to evaluate the conditions that must be realized in order for the quasilinear diffusion flux of the fusion products to become significant. It is found that in the most relevant cases a severe deterioration in the confinement properties of the fusion products is not to be expected. This result follows from taking explicitly into account the spectral properties of shear Alfven perturbations in a toroidal configuration with magnetic shear. (28 refs.)

66684 Alpha particle loss and energy deposition in tandem mirrors. J.F.Santarius, J.D.Callen (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
Phys. Fluids (USA), vol.26, no.4, p.1037-43 (April 1983).
The bounce averaged Fokker-Planck equation is solved for alpha particles slowing down in a background plasma of electrons and ions in the central cell of a tandem mirror. The problem is formulated for a general, monotonic magnetic field, and then solved numerically for the square-well case. This gives a distribution function in energy and lambda (magnetic moment/energy). The resulting loss of alpha particles by scattering into the magnetic loss cone and the distribution of alpha-particle energy to ions and electrons are given. For typical tandem mirror reactor parameters ($T_e\sim30$ keV, $\phi\sim100$ keV, $R\sim4$) about half of the alpha particles are born in or scatter into the loss cones, but less than 25% of the total alpha particles' energy is lost through these mechanisms. (14 refs.)

66685 Spectroscopic determination of the viscosity of a fully ionized plasma by means of the dynamics of acceleration by a traveling wave. M.von Hellermann, C.Piffko, A.Stampa (Fachbereich Phys., Univ. Essen-GHS, Essen, Germany).
Phys. Fluids (USA), vol.26, no.4, p.1054-60 (April 1983).
The mechanism of plasma acceleration by a traveling wave is derived from a cold plasma magnetohydrodynamic model with finite conductivity and finite Hall parameter. It is shown that collective effects may strongly influence the dynamics of the acceleration process. Eigenmodes of the plasma column considerably improve the acceleration whereas in general, plasma turbulence, induced by the primary wave, will reduce the efficiency of the process. Both mechanisms are demonstrated in an experiment where a high-amplitude traveling-wave pulse accelerates a nearly fully ionized plasma. In this experiment the flow profile is determined by the balance of electromagnetic and viscous forces. This enables one to determine the viscosity spectroscopically by measuring the flow velocity of the plasma. The experimental value of the viscosity is in accordance with the Spitzer formula. (8 refs.)

66686 Studies of radio frequency current drive in a plasma. D.K.Bhadra, C.Chu, R.W.Harvey, R.Prater (General Atomic Co., San Diego, CA, USA).
Plasma Phys. (GB), vol.25, no.4, p.361-85 (April 1983).
The physics of radio-frequency current drive for steady-state Tokamak operation has been studied in the context of a conceptual small Tokamak, called the RST. Two distinctively different schemes of current drive by using RF waves have been discussed. In the first, a wave travelling in the toroidal direction damps on the electrons, thereby transferring momentum to the electrons, creating a current; typical of this category is Landau damping of traveling lower hybrid waves. The second general category is called 'enhanced bootstrap' current, in which RF waves may be used to enhance the cross-field particle diffusion above the neoclassical rate, thereby producing significant enhancement of the plasma bootstrap current at reduced plasma pressure. (29 refs.)

66687 The effect of localised wave power absorption on ECRH driven currents in a Tokamak. D.F.H.Start, J.G.Cordey, T.Edlington (Culham Lab., Abingdon, England).
Plasma Phys. (GB), vol.25, no.4, p.447-53 (April 1983).
The current driven by electron cyclotron resonance heating in a Tokamak is shown to depend strongly on the poloidal angle at which the power is absorbed. This dependence arises because the ratio of passing to trapped electrons varies around each flux surface. A Fokker-Planck treatment is used to obtain the current as a function of poloidal angle, wave phase velocity and inverse aspect ratio. The effect offers the possibility of experimentally demonstrating the existence of trapped electrons in a Tokamak. (8 refs.)

52.25P Emission, absorption, and scattering of radiation

66688 Electromagnetic radiation from beam-plasma instabilities. P.L.Pritchett, J.M.Dawson (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

Phys. Fluids (USA), vol.26, no.4, p.1114-22 (April 1983).

The generation of electromagnetic radiation from the unstable electrostatic waves of a beam-plasma system is investigated by means of computer simulation. A two-dimensional model is employed in which the plasma is treated as a finite system and in which the effects of a continuous beam inflow are included. For the parameters of the simulation ($n_b/n_0 \sim 1\%$, an essentially nonrelativistic beam, and no external magnetic field), the radiation is concentrated near the plasma frequency, is emitted preferentially perpendicular to the beam, and is polarized with **E** parallel to the beam direction. Radiation at the second harmonic is found to be weak. The production mechanism is found to be the scattering of Langmuir waves from ion-acoustic fluctuations, and the observed radiation level agrees well with the theoretical predictions for such a three-wave coupling. The results of the numerical experiments are compared with the recent laboratory experiment of Whelan and Stenzel (Phys. Rev. Lett. vol.47, no.2, p.95, 1981). (22 refs.)

52.30 PLASMA FLOW; MAGNETOHYDRODYNAMICS

(see also 47.65 Fluid dynamics)

66689 Resistive force acting on a microscopic particle in a low-temperature plasma jet. A.A.Uglov, A.G.Gnedovets, Yu.N.Lokhov (A.A. Baikov Metall. Inst., Acad. of Sci., USSR).

High Temp. (USA), vol.20, no.4, p.512-17 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.621-6 (July-Aug. 1982). [received: April 1983]

Properties of charge exchange between a microscopic particle and a rarefied flow of low-temperature plasma are considered. If the microscopic particle is small and charged ($R < r_D$), interaction of plasma ions with the microscopic particle contributed greatly to the resistance. (18 refs.)

66690 Magnetohydrodynamics of average fields in an inhomogeneous turbulent medium. L.L.Kichatinov.

Magnetohydrodynamics (USA), vol.18, no.3, p.266-72 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.67-73 (July-Sept. 1982). [received: April 1983]

MHD turbulence is characteristic of plasma in many cases. All physical quantities characterizing the plasma contain random fine-scale pulsations against the background of relatively large-scale components. Turbulence in many ways determines the dynamics of average fields. The phenomena of turbulent diffusion and viscosity, a diamagnetism of turbulent plasma, and other effects important for applications are well known. The author examines the dynamics of a large-scale magnetic field and a velocity field, i.e. magnetic hydrodynamics of average fields, in the presence of turbulence. (10 refs.)

66691 Expansion of a multi-ion plasma into a vacuum. Nagendra Singh, R.W.Schunk (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA).

Phys. Fluids (USA), vol.26, no.4, p.1123-8 (April 1983).

Numerical solutions of the Vlasov and Poisson equations for the expansion of a plasma with O^+ and H^+ as the constituent ions are presented. The self-similar nature of the expansion is examined by comparing the numerical results with available theories. The formation of a plateau in the expansion region, when the H^+ ions are initially minor, is investigated by varying the electron to ion temperature ratio. The numerical results show that self-similarity holds in the quasineutral regions of the plasma. (10 refs.)

66692 Observations of plasma rotation in the high beta Tokamak Torus II. C.A.Kostek, T.C.Marshall (Dept. of Appl. Phys. & Nuclear Engng., Columbia Univ., New York, NY, USA).

Plasma Phys. (GB), vol.25, no.4, p.421-33 (April 1983).

Toroidal and poloidal plasma rotation are measured in a high beta Tokamak device by studying the Doppler shift of the 4686 Å He II line. The toroidal flow motion is in the same direction as the plasma current at an average velocity of 1.6×10^6 cm s^{-1}, a small fraction of the ion thermal speed. The poloidal flow follows the ion diamagnetic direction, also at an average speed of 1.6×10^6 cm^{-1}. In view of certain ordering parameters, the toroidal flow is compared with the predictions of neoclassical transport theory in the collisional regime. For the poloidal motion, however, it is likely that an $(\mathbf{E}_r \times \mathbf{B})/B^2$ drift in a positive radial electric field, approaching a stable ambipolar state (Stringer, 1970) is responsible. Mechanisms for the time evolution of the rotation are also examined. The radial electric field responsible for the $(\mathbf{E}_r \times \mathbf{B})/B^2$ drift is determined from the theory using the measured poloidal velocity. (25 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

66693 The nongeometrical optic solution for the Alfven wave in double plasma beam model. Shi Chang-he (Dept. of Geophys., Peking Univ., Peking, China).

Acta Phys. Sin. (China), vol.32, no.1, p.25-32 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*

The author used the smooth perturbation method to treat the problem of Alfven wave propagation in double plasma system. The wave propagation is analysed for two cases. One is that when the dense homogeneous beam moves in an inhomogeneous background plasma and the other one is the opposite situation. (8 refs.)

66694 Parametric stabilisation of fire-hose instability in a plasma. B.K.Shivamoggi (Dept. of Theoretical Phys., Australian Nat. Univ., Canberra, Australia).

Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.443-6 (1983).

Parametric stabilisation of a fire-hose instability in an anisotropic plasma with regard to an Alfven wave by means of a temporally-modulating magnetic field is discussed. (8 refs.)

66695 Drift waves in a straight stellarator. A.Bhattacharjee, J.E.Sedlak, P.L.Similon, M.N.Rosenbluth, D.W.Ross (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA).

Phys. Fluids (USA), vol.26, no.4, p.880-2 (April 1983).

The eigenmode structure of drift waves in a straight stellarator is investigated using the ballooning mode formalism. The electrons are assumed to be adiabatic and the ions constitute a cold, magnetized fluid. The 'effective potential' has an overall parabolic envelope but is modulated strongly by helical ripples along **B**. Two classes of solutions are found: those that are strongly localized in local helical wells, and those that are weakly localized and have broad spatial extent. The weakly localized modes decay spatially due to the existence of Mathieu resonances between the periods of the eigenfunction and the modulation of the 'effective potential'. (6 refs.)

66696 Ion-acoustic waves infinite geometry. R.V.Jensen, I.B.Bernstein (Mason Lab., Yale Univ., New Haven, CT, USA).

Phys. Fluids (USA), vol.26, no.4, p.953-8 (April 1983).

The effects of finite geometry on the frequency spectrum and mode structure of ion-acoustic oscillations in an equilibrium ($T_e = T_i$) plasma are investigated. Numerical and analytical results for one-dimensional models of collisional plasmas with both absorbing and reflecting boundaries show that these modes are strongly damped. With absorbing boundaries the fluctuations are damped in an ion-transit time. For reflecting boundaries the frequency spectrum is identical to the heavily Landau-damped spectrum for an unbounded plasma. These theoretical calculations suggest that the weakly damped, low-frequency density fluctuations recently observed in incandescent cavities are not ion-acoustic waves. (14 refs.)

66697 Electromagnetic instability of Langmuir waves in a magnetoplasma. P.K.Shukla, M.Y.Yu (Inst. fur Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany).

Phys. Fluids (USA), vol.26, no.4, p.959-61 (April 1983).

The stability of a finite amplitude electron plasma wave with respect to Alfven wave perturbations is considered. Three-wave decay as well as modulational instabilities are investigated. Analytical expressions for the growth rates are obtained. (11 refs.)

66698 Drift-resistive interchange and tearing modes in cylindrical geometry. J.M.Finn, W.M.Manheimer (Naval Res. Lab., Washington, DC, USA).

Phys. Fluids (USA), vol.26, no.4, p.962-73 (April 1983).

Resistive interchange and tearing modes are studied including the effects of electron parallel pressure gradient and ion polarization drift (Hall terms) as well as finite plasma compressibility and perpendicular resistivity. It is found that for unfavorable curvature and weak tearing forces (positive but small Δ') all modes are stabilized provided the effects of the Hall (drift) terms are large enough. The principal stabilizing influences are plasma compression and coupling to outgoing drift waves. The relevance to reversed field pinch and spheromak experiments is discussed. (31 refs.)

66699 The whistler instability at relativistic energies. N.T.Gladd (JAYCOR, San Diego, CA, USA).

Phys. Fluids (USA), vol.26, no.4, p.974-82 (April 1983).

The effects of a relativistic electron population on the temporal and spatial growth rates of the whistler instability are considered. It is found that relativistic effects tend to reduce the temporal growth rate of the whistler but are not sufficient, by themselves, to completely stabilize the mode. Relativistic effects are also found to reduce the volume of parameter space over which temporal growth can occur; the residual rate of spatial growth, however, is substantial. The results obtained are applied to two plasmas with significant relativistic electron content—the ELMO Bumpy Torus and the Tandem Mirror Experiments. (22 refs.)

66700 Solitary drift waves in the presence of magnetic shear. J.D.Meiss, W.Horton (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA).

Phys. Fluids (USA), vol.26, no.4, p.990-7 (April 1983).

The two-component fluid equations describing electron-drift and ion-acoustic waves in a nonuniform magnetized plasma are shown to possess nonlinear two-dimensional solitary wave solutions. In the presence of magnetic shear, radiative shear damping is exponentially small in L_s/L_n for solitary drift waves, in contrast to linear waves. (15 refs.)

66701 Experimental study of the dissipative trapped ion instability. G.A.Navratil, A.K.Sen, J.Slough (Plasma Phys. Lab., Columbia Univ., New York, NY, USA).

Phys. Fluids (USA), vol.26, no.4, p.1044-53 (April 1983).

A new, steady-state linear machine has been constructed which produces a low-density, low-temperature hydrogen plasma in the collisionality regime of the dissipative trapped ion instability. This instability was seen and identified through the observed dependence of the wave amplitude on trapped fraction, axial and radial position, and collisionality and through the scaling of the real frequency with trapped fraction. The observed radial and axial mode structure of the instability is compared with the results of a simple radial model and a calculation of the Landau damping for both trapped and transit particles in a linear geometry. (13 refs.)

66702 Linear oscillations in general magnetically confined plasmas. Liu Chen (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA), Shih-Tung Tsai.
Plasma Phys. (GB), vol.25, no.4, p.349-59 (April 1983).
A systematic formalism for investigating linear electromagnetic perturbations in general magnetic field configurations is developed. The formalism employs the small adiabaticity parameter ρ/L_0 and is valid for arbitrary frequencies. Here, ρ and L_0 are, respectively, the Larmor radius and equilibrium scale length. Effects associated with plasma and magnetic field inhomogeneities as well as finite Larmor radii are contained. The specific case of axisymmetric Tokamaks is then considered to illustrate the potential application. (18 refs.)

66703 Dispersive effects for Alfven surface waves. I.C.Rae (Res. Group, British Aerospace Dynamics Group plc, Hatfield, England).
Plasma Phys. (GB), vol.25, no.4, p.455-8 (April 1983).
Non-dispersive Alfven surface waves at a plasma interface became dispersive when non-uniformities in the equilibrium are introduced. (10 refs.)

66704 The sideband instability and wave-particle interaction. B.P.Koch, R.W.Leven (Sektion Phys./Elektronik, Ernst-Moritz-Arndt-Univ. Greifswald, Greifswald, Germany).
Phys. Scr. (Sweden), vol.27, no.3, p.220-4 (March 1983).
The sideband instability of a large amplitude electron plasma wave is studied by the numerical solution of the Vlasov equation. To give the contribution of the wave-particle mechanism exactly the quasilinear equations are solved simultaneously. As a result the wave-particle mechanism is to some extent responsible for the instability of the lower sideband. To explain the instability of the upper sideband, mode coupling must be included. (18 refs.)

66705 Angular distribution of ion-acoustic turbulence in a magnetized plasma with current. G.M.Batanov, A.E.Petrov, A.V.Sapozhnikov, K.A.Sarksyan, N.N.Skvortsova.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.27-32 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.32-7 (1982).
Presents the results of an experimental investigation of the ion acoustic turbulence in a magnetoactive plasma excited by a drift current. The spectrum of the ion-acoustic turbulence is found to be anisotropic with a maximum, directed perpendicular to the current. (10 refs.)

52.35R Plasma turbulence

66706 Steady-state turbulence with a narrow inertial range. J.C.Weatherall, D.R.Nicholson, M.V.Goldman (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA).
Phys. Fluids (USA), vol.26, no.4, p.1103-13 (April 1983).
Coupled two-dimensional wave equations are solved on a computer to model Langmuir wave turbulence excited by a weak electron beam. The model includes wave growth due to beam-plasma interaction, and dissipation by Landau damping. The inertial range is limited to a relatively small number of modes such as could occur when the ratio of masses between the negative and positive ions is larger than in a hydrogen plasma, or when there is damping in long wavelength Langmuir waves. A steady state is found consisting of quasistable, collapsed wave packets. The effects of different beam parameters and the assumed narrow inertial range are considered. The results may be relevant to plasma turbulence observed in connection with type III solar bursts. (40 refs.)

52.35T Shock waves

66707 Structure of an excited weakly ionized plasma with a discontinuously moving neutral component. A.A.Rukhadze, S.F.Teselkin (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1311-13 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2129-33 (Nov. 1982). [received: May 1983]
The structure of plane ion-sound waves of finite amplitude maintained in a weakly ionized plasma by a shock wave in the neutral component is studied theoretically. The two cases of a nonisothermal gas plasma by $T_e \gg T_i \gtrsim T_n$ and a plasma in solids with a degenerate electron component are considered. It is shown that forced interaction of neutral particles with the charged component results in ion-neutral friction and produces an excitation in the charged plasma component similar to a shock wave, with leading edge width much greater than the free path lengths of the ions and neutral particles. 66708 Repopulation kinetics of intermediate levels in CO_2 laser helium grow discharge interaction. G.Gousset, P.Pignolet, B.Dubreuil (CNRS, Univ. d'Orleans, Orleans, France).
J. Phys. B (GB), vol.16, no.9, p.L299-304 (14 May 1983).
A time-resolved spectroscopic study of the perturbation of a capillary glow discharge in helium by radiation from a TEA CO_2 laser ($I_L = 6$ MW cm^{-2}) is reported. The one- and two-photon ionisation processes induced a lowering of the $p \geq 8$ excited-state population. However, due to collisional and radiative processes the states $p \leq 7$ which do not undergo photoionisation are also strongly depopulated. From a comparison of a kinetic model with experiment, total recombination and quenching coefficients for $p \leq 7$ levels are obtained. (11 refs.)

66709 Stimulated Raman backscattering in the presence of ion-acoustic fluctuations. W.Rozmus, A.A.Offenberger, R.Fedosejevs (Dept. of Electrical Engng., Univ. of Alberta, Edmonton, Alberta, Canada).
Phys. Fluids (USA), vol.26, no.4, p.1071-8 (April 1983).
Threshold conditions are analyzed for stimulated Raman backscattering (SRS) from an underdense plasma in the presence of ion-acoustic fluctuations. For typical ion-acoustic spectra which could result from a Brillouin instability occurring simultaneously with SRS, a reduced collisional threshold due to induced bremsstrahlung is found for the Raman instability. Similarly, for inhomogeneous plasma the phase mismatch created by a density gradient can be compensated for by an inhomogeneity in the ion-acoustic spectrum; as a consequence, the inhomogeneity threshold for absolute instability can be substantially reduced. Comparisons are made with experimental observations of stimulated Raman scattering in the presence of strong stimulated Brillouin scattering for CO_2 laser-plasma interaction. It is found theoretically that for fluctuation levels typical of that accompanying SBS, induced bremsstrahlung growth rates for Langmuir waves can be of the order of collisional damping rates. (23 refs.)

66710 Stimulated Brillouin scattering in an inhomogeneous plasma with broad-bandwidth thermal noise. A.Ramani (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France), C.E.Max.
Phys. Fluids (USA), vol.26, no.4, p.1079-102 (April 1983).
Stimulated Brillouin scattering in a plasma containing broad-bandwidth thermal noise was considered. Plasma profiles which are inhomogeneous (for example, because of a velocity gradient) were studied. At each point in the profile, a different electromagnetic wave can be resonant with the pump wave and a local ion acoustic wave, and can thus be amplified from its noise level. Some difficult points of the linear theory of this process are first examined. Then a nonlinear equation is derived, which governs the decrease of the incident-wave amplitude as it propagates toward the critical density surface. Solutions of this equation predict a maximum value of the absorbed intensity, I_{max}. For incident laser intensities I_{in}, higher than this value, only a fraction I_{max}/I_{in} is absorbed. (22 refs.)

66711 Refraction and absorption in plasma atmospheres. G.J.Pert (Dept. of Appl. Phys., Univ. of Hull, Hull, England).
Plasma Phys. (GB), vol.25, no.4, p.387-419 (April 1983).
Within the geometrical optics approximation the path of a ray in a plasma atmosphere is identical to the motion of a single particle under a potential of the same spatial variation as the electron density. The analogy may be used to construct the ray trajectories. In particular a set of analytic solutions for spherical atmospheres with inverse power law density fall off may be constructed. The absorption due to linear processes, collisional and resonant, is then evaluated. The application of these solutions to cylindrical and planar atmospheres is demonstrated. The extension to more general density distribution is outlined. (9 refs.)

66712 Propagation of a Gaussian beam in a nonhomogeneous plasma. A.L.Gutman.
Radio Eng. & Electron. Phys. (USA), vol.27, no.6, p.16-25 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.6, p.1073-82 (June 1982). [received: May 1983]
The method of standard equations is used to obtain a linearly approximate solution to the problem of propagation of a Gaussian beam in a smoothly nonhomogeneous, plane-stratified medium which contains a region where the dielectric permittivity changes from positive to negative values. Asymptotic behaviour of incident, reflected and transmitted beams is discussed and the conditions of preservation of characteristic structure are derived. (5 refs.)

66713 Magnetic guiding, focusing and compression of an intense charge-neutral ion beam. S.Robertson (Phys. Dept., Univ. of California, Irvine, CA, USA).
Phys. Fluids (USA), vol.26, no.4, p.1129-38 (April 1983).
The motion of an intense, charge- and current-neutralized ion beam propagating axially into a solenoidal magnetic field in vacuum is shown to be described by one of two models depending on whether or not the beam magnetic skin depth c/ω_{pe} exceeds half the beam radius. For a less-intense beam having a large skin depth, a new theoretical model is presented which shows that a solenoidal field penetrates to the beam axis and acts as a lens. If a minimum beam density is exceeded, the electrons and ions are brought to a common focus as a result of quasineutrality. The collective focal length is the geometric mean of the focal lengths for the two species when traveling alone. For an intense beam having a small skin depth, the applied field is excluded from the center of the beam channel by a skin current and the resulting magnetic pressure gradient compresses the beam. This case is similar to the theta pinch and is described by a snowplow model.The two models are verified by experiments with a 150 kV, 0.5-5 A/cm^2 proton beam from a magnetically insulated diode. Possible applications in magnetic fusion, inertial fusion, and magnetospheric physics are discussed. (36 refs.)

66714 Fast-ion behaviour for quasi-perpendicular high-energy neutral injection into the TFR 600 Tokamak.
Nucl. Fusion (Austria), vol.23, no.4, p.425-32 (April 1983).
A systematic comparison of charge exchange and neutron flux measurements with a Monte Carlo simulation code solving the full Fokker-Planck equation has shown that the fast-ion behaviour in TFR 600, with quasiperpendicular injection, can be explained classically. This important conclusion permits the beam energy deposition and the energy given to the plasma electrons and ions to be calculated so that the energy balance of the plasma can be obtained. (21 refs.)

66715 Current driven by a asymmetrical minority heating in ICRF. S.C.Chiu, V.S.Chan, J.Y.Hsu, G.E.Guest, R.Prater, J.M.Rawls (General Atomic Co., San Diego, CA, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.499-511 (April 1983).
Current generation by asymmetric heating of a minority ion species in the ion cyclotron range frequencies is calculated in the weak RF limit in toroidal geometry. Both trapped ions and trapped electrons produce significant modifications to the current generated. Depending on the ratio of the charge of minority to majority species, the current generated can be either sharply peaked at the centre or flattened towards the outside. (22 refs.)

66716 Quasi-linear ion heating by lower hybrid waves. M.Brambilla, Yan-ping Chen (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).
Nucl. Fusion (Austria), vol.23, no.4, p.541-5 (April 1983).
The authors have investigated quasi-linear ion Landau damping of lower hybrid waves in an inhomogeneous plasma. To this end, they have simultaneously solved Maxwell equations and the ion kinetic equation, starting from the antenna and proceeding towards the centre of a plane-layered plasma. As a consequence of the development of a supra-thermal tail in the ion distribution function, the efficiency of the absorption increases and the asorption region is found to shift to lower densities as the launched power increases. Absorption is always complete at the layer where the wave phase velocity equals about three times the local ion thermal velocity usually somewhat before the linear turning point is reached. (19 refs.)

66717 Geometry effects on ion heating at ion cyclotron frequencies. H.Weitzner (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).
Phys. Fluids (USA), vol.26, no.4, p.998-1007 (April 1983).
The interaction of ions with electromagnetic waves at frequencies on the order of the ion cyclotron frequency is studied without the assumption of geometrical optics. Instead, it is assumed that the time for an ion to travel one wavelength is large compared with the wave period. Such a scaling admits nontrivial effects of the plasma geometry and is particularly appropriate to the ELMO Bumpy Torus experiment. The relevant frequency range is from one to a moderate multiple of the ion cyclotron frequency. It is shown that the ion response may be represented by the usual cold ion conductivity and with appropriate jump conditions across the fundamental resonant surface. Nonresonant energy transfer is calculated and shown to exist under many circumstances, depending on the antenna and electron response. Expressions are given for the resonant energy absorption at the fundamental and second harmonic. At higher harmonics, the nonresonant energy transfer is large compared with the resonant absorption. (3 refs.)

66719 Non-Maxwellian electrons in a laser produced sodium plasma. W.Lowell Morgan (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.790-1 (1 May 1983).
Time-dependent Boltzmann calculations of the electron energy distribution function in a laser excited sodium plasma have been performed. Such nonequilibrium plasmas are produced in alkali metal vapor by laser irradiation of the *ns-np* resonance line. The electrons in these plasmas are heated by superelastic collisions with atoms in the *np* state giving a distribution of electrons in energy that is characterized by a series of spikes at energies separated by the *ns-np* transition energy, 2.1 eV for sodium. (16 refs.)

66720 Pulsed megagauss fields produced by laser-driven coils. J.F.Seely (Optical Sci. Div., Naval Res. Lab., Washington, DC, USA).
Appl. Phys. B (Germany), vol.B31, no.1, p.37-43 (May 1983).
The generation of pulsed magnetic fields in the range 20 kG to 2 MG by laser-driven coils is analyzed. Previous experimental results are modeled using a time-dependent circuit equation. By varying the circuit parameters and the coil geometry it is shown that a field of 30 kG and a rate of change of 4 kG/ns can be generated by a small single-turn solenoid driven by a 1 J, 20 ns laser pulse. Using a more energetic laser pulse, a rate of 600 kG/ns is achievable. This value of dB/dt greatly exceeds that available from the more conventional field generation devices and is important for the observation of transient magnetic phenomena. (15 refs.)

66721 Metal plasma induced by the bombardment of 308 nm excimer and 585 nm dye laser pulses at low pressure. K.Kagawa (Faculty of Education, Fukui Univ., Fukui, Japan), S.Yokoi, S.Nakajima.
Opt. Commun. (Netherlands), vol.45, no.4, p.261-5 (15 April 1983).
The characteristics of the plasma induced by the bombardment of laser pulses (4-6 mJ, 10-15 ns) on a metal surface kept in the pressure range (0.1-10 Torr) is studied. The laser induced plasma consists of two distinct regions. One is a small-region plasma (primary plasma), which emits an intense continuous emission spectrum for a few tenths of 0.1 μs. The other is a plasma (secondary plasma) spreading out with time, which emits intense atomic emission spectra. It was found that the displacement length of the front of the secondary plasma is proportional to the two-fifths power of time. This fact indicates that the blast wave plays an important role in the mechanism of forming the luminous secondary plasma. The primary plasma is considered as the source of the blast wave. (7 refs.)

66722 Laser-plasma-induced extreme-ultraviolet radiation from liquid mercury. R.M.Jopson, S.Darack, R.R.Freeman (Bell Labs., Murray Hill, NJ, USA), J.Bokor.
Opt. Lett. (USA), vol.8, no.5, p.265-7 (May 1983).
Extreme ultraviolet (XUV) radiation from 100 to less than 30 nm is emitted from a laser-induced plasma generated on a liquid-mercury surface. This surface does not degrade even after tens of thousands of laser pulses. The 532-nm laser light focused on the mercury surface. The plasma core produces primarily continuum radiation, whereas the plume emits lines at wavelengths above 77 nm. The mercury was generated at the entrance port of a normal incidence vacuum monochromator, and the dispersed XUV radiation was monitored with a photomultiplier tube. (3 refs.)

Limitation of the accuracy of interferometrically measured electron density profiles of laser-produced plasmas .... See Entry 66748

52.55 PLASMA EQUILIBRIUM AND CONFINEMENT

66723 Some physical problems of RF heated Tokamak plasma in a hybrid reactor regime. L.Krlin, P.Pavlo, Z.Tluchor (Inst. of Plasma Phys., Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.429-42 (1983).
The authors present a simple physical model of an RF heated Tokamak and the first estimates of its parameters in a hybrid reactor regime. The plasma is heated by the absorption of lower hybrid waves. Under conditions close to those of a hybrid reactor, they estimate the outgoing power, the power deposited by alpha particles, the RF power absorbed in a plasma (to balance the energy losses), the driven current coupled with the RF absorption, the neutron flux and the production rate of plutonium. The magnitude of the driven current seems to be sufficient to maintain the steady-state regime. (20 refs.)

66724 Joint European Torus (JET)—a major experiment in nuclear fission. E.Bertolini.
Int. Power Generation (GB), vol.6, no.3, p.10-14 (April 1983).
The Joint European Torus now nearing completion of the construction phase near Abingdon in England is an experiment on a large scale. Its purpose is the study of plasma physics and nuclear fusion. JET itself will never produce electric power from nuclear fusion but the work done over the next few years will pave the way for the eventual introduction of commercial fusion power reactors. The author summarises JET in relation to fusion research taking place in other parts of the world, and the accompanying articles cover in more detail the construction of the experimental Tokamak and the provision of power supplies. (no refs.)

66725 The construction of JET.
Int. Power Generation (GB), vol.6, no.3, p.16-17 (April 1983).
A feature which distinguishes JET from other tokamaks in its size. In particular the plasma volume, at 200 m^3, is very much larger than previous tokamaks. The plasma will be established in a toroidal vacuum vessel with a D-shape cross section of 2.5 m×4.2 m high with a major radius of 2.95 m. (no refs.)

66726 Power supplies for JET.
Int. Power Generation (GB), vol.6, no.3, p.17, 19-20 (April 1983).
Since JET is an experiment in plasma physics rather than a commercial fusion reactor, large quantities of power must be supplied in pulses to produce and stabilise a plasma. The peak load is in excess of 700 MW. This is more than could be drawn from the CEGB grid in short pulses, strong though that is, and in consequence, two flywheel storage systems have been built. (no refs.)

66727 Behavior of Cs^+-UF_6^- ion-pair plasmas in radiofrequency quadrupole-dipole fields. I. Experiment. S.Wexler, E.K.Parks, C.E.Young, R.A.Bennett (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1730-54 (April 1983).
The behavior of a flowing Cs^+-UF_6^- ion-pair plasma in the radiofrequency (RF) quadrupole-dipole fields of a mass filter has been studied experimentally. The flowing plasma was formed by collision of a beam of accelerated UF_6 molecules with an intense beam of thermal Cs atoms. The maximum current (positive- or negative-ion flux) entering the mass filter was 0.5×10^{-3} A, corresponding to a positive- or negative-ion density in the injection region of $\sim1.1\times10^{10}$ ions/cm^3. Four aspects of the interaction of the plasma with the radiofrequency fields were investigated: (1) the injection of the ion-pair plasma into the quadrupole-dipole field, (2) confinement by and transmission of the flowing plasma through a quadrupole field, (3) mass-sensitive ejection of ions from the plasma by superimposed quadrupole and dipole fields, and (4) effects of the extraction and exit fringe fields on the flowing plasma. In particular, the effects of increasing plasma density in relation to the above topics was experimentally determined. The results of the experimental observations in conjunction with the theoretical calculations discussed in the following paper suggest that the limiting-ion flux that can be confined within a quadrupole mass filter is determined by the requirement of the plasma frequency ν_p must be lower than or at most equal to the applied RF quadrupole frequency ν_1. If $\nu_p>\nu_1$, the RF field causes rapid destruction of the plasma. The mass-resolving power of the mass filter was found to deteriorate significantly with increasing plasma throughput, a result of the increasing space-charge forces within the plasma and their interaction with the applied dipole field. (15 refs.)

66728 Behaviour of Cs^+-UF_6^- ion-pair plasmas in radiofrequency quadrupole-dipole fields. II. Theory. A.F.Wagner (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1755-80 (April 1983).
For pt.I see ibid., vol.54, no.4, p.1730-54 (1983). The behaviour of a flowing Cs^+-UF_6^- ion-pair plasma in the radiofrequency (RF) quadrupole-dipole fields of a mass filter has been studied theoretically. For low-density plasmas, the calculations involved trajectory studies of isolated ions in a quadrupole-dipole fields with or without fringe fields. For high-density plasmas, two-dimensional particle-in-cell trajectory studies were used to self-consistently incorporate space-charge effects into the simulated plasma behaviour in perfect quadrupole-dipole fields uncomplicated by fringe fields. Three aspects of the interaction of the plasma with the radiofrequency fields were investigated: (1) the effects of fringe fields, especially on the injection of the plasma into the quadrupole-dipole field, (2) confinement by and transmission of the flowing plasma through a quadrupole field, and (3) mass-sensitive ejection of ions from the plasma by superimposed quadrupole and dipole fields. For each of these three topics, the theoretical results were compared with the experimental observations, especially with regard to the effect of increasing plasma density. In general, the agreement between theory and experiment is good. The theoretical calculations suggest a limiting current of several hundred microamperes that can be transmitted by the mass filter. The limit is reached when the plasma density increases to the level where the plasma frequency is comparable with the applied RF quadrupole frequency. At higher densities, successive layers of the plasma peel off and are driven out by the applied field until the limiting density is reached. This effect interferes with mass-sensitive ion ejection by the applied dipole field and also induces additional plasma loss in the fringe fields. (16 refs.)

66729 Numerical study of Vlasov equilibrium in a double cusp magnetic field. K.Hamamatsu (Faculty of Sci., Hiroshima Univ., Hiroshima, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1230-41 (April 1983).
Vlasov equilibria of a periodic array of axisymmetric double cusp plasmas are studied numerically for various values of β (ratio of the maximum plasma pressure to the maximum magnetic pressure at midplane of the double cusp vessel). Effects of finite Larmor radius, ambipolar potential and presence of cold plasma component are taken into account. It is shown that the plasma volume expands as β increases, forming a clear transition layer between plasma and vacuum with thickness of the order of the local ion Larmor radius in the high-β case. The stored energy in a single vessel increases rapidly with β. A strong ambipolar potential is formed either in the line cusp region or in the point cusp region, depending on the boundary conditions, and the plasma expands radially in the central region. Cold electrons are gathered in the central region by the ambipolar potential, but the hot plasma component is little affected by the potential. (8 refs.)

66730 Stability of an expanding plasma current shell. A.S.Pleshanov.
Magnetohydrodynamics (USA), vol.18, no.3, p.263-6 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.63-6 (July-Sept. 1982). [received: April 1983]
The concept of a plasma shell with a central current filament (expanding pinch) was derived from experimental data by Komel'kov (1959). Subsequently, experimental results were obtained that confirmed and extended this concept. Calculations have been performed on the expansion of a two-dimensional axially symmetrical plasma current shell in the approximation of an ideally conducting compressible plasma with surface currents. The author examines the stability of such a formation in an approximation linear in the perturbation amplitude for one-dimensional cylindrical expansion. (7 refs.)

66731 Neoclassical theory of alpha-particle transport in the central region of a Tokamak plasma. V.Ya.Goloborod'ko, Ya.I.Kolesnichenko, V.A.Yavorskij (Inst. for Nuclear Res., Acad. of Sci., Kiev, Ukrainian SSR).
Nucl. Fusion (Austria), vol.23, no.4, p.399-406 (April 1983).
A neoclassical theory applicable to the central region of a reactor Tokamak plasma is developed for high-energy alpha-particle transport processes. It is shown that in the neighbourhood of the magnetic axis (and on the axis itself), the alpha-particle bootstrap current, and flux across the magnetic field are non-zero and may be comparable with the corresponding quantities in the region far from the axis. (17 refs.)

66732 Thermal barrier on trapping rate in a tandem mirror. R.Carrera, J.D.Callen (Dept. of Nuclear Engng., Univ. of Wisconsin, Madison, WI, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.433-45 (April 1983).
An analytic expression for the Coulomb collision induced ion trapping rate in the thermal barrier cell of a tandem mirror has been obtained. The overall system is assumed to be maintained in steady state by particle injection in the central cell and charge-exchange pumping in the barrier cell. For small ratios of bounce-to-collision time scales the problem reduces to a series of boundary value problems in the various regions of phase space. For conditions of interest, pitch-angle trapping is dominant and a Lorentz collision operator describe reasonably well the kinetic problem, which is solved using a square-well approximation. The analytic results are found to agree with numerical results within expected limits, on the order of the inverse of the barrier/mirror ratio ($\sim$10 to 20%). (21 refs.)

66733 A pressure profile analysis of high-beta ISX-B Tokamak plasmas using MHD equilibrium geometry. R.M.Wieland, H.C.Howe, E.A.Lazarus, M.Murakami, C.E.Thomas (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.447-65 (April 1983).
The paper describes a method, as implemented in the computer code ZORNOC, for the analysis of high-beta, non-circular ISX-B Tokamak plasma profiles. Thomson scattering electron temperature and density profiles, obtained at a fixed time into the discharge, are used as a basis for performing a complete energy analysis of the plasma and for obtaining confinement parameters assuming steady-state conditions. Self-consistent models for both magnetohydrodynamic equilibrium and ion power balance are used to obtain internal flux surface and ion temperature profiles, respectively, consistent with all the known diagnostic data. Using boundary conditions consistent with poloidal magnetic measurements, a current profile parameterization is obtained that is consistent with the observed location of the $q=1$ surface as indicated by soft X-ray diagnostics. A specific high-beta discharge is analysed in order to illustrate the procedure. (27 refs.)

66734 Parametric systems analysis of the modular stellarator reactor. R.L.Miller, R.A.Krakowski, C.G.Bathke (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.467-79 (April 1983).
The close coupling in the stellarator/torsatron/heliotron between coil design (winding law, peak field, current density, forces), magnetics topology (transform, shear, well depth) and plasma performance (equilibrium, stability, transport, beta) complicates reactor assessment more than for most magnetic confinement systems. In order to provide an additional degree of resolution of this problem for the modular stellarator reactor (MSR), a parametric systems model has been developed and applied. This model reduces key issues associated with plasma performance, first-wall/blanket/shield and coil design to a simple relationship between beta, system geometry and a number of key indicators of overall plant performance. The results of this analysis can then be used to guide more detailed, multidimensional plasma, magnetics and coil design efforts towards technically and economically viable operating regimes. In general, it is shown that average beta values of $\gtrsim0.08$ may be needed if the MSR approach is to be substantially competitive with other projected approaches to DT magnetic fusion in terms of system power density, mass utilization and cost for total thermal output power around 4.0 GW(th); lower powers will require even higher beta values. (29 refs.)

66735 ICRF heating and its effect on single-particle confinement in Tokamaks. K.W.Whang, G.J.Morales (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.481-97 (April 1983).
Ion cyclotron resonance heating (ICRH) and its intrinsic effect on confinement in Tokamaks is investigated. The stochastic nature of ICRH in the absence of collisions is examined through finite-mapping equations. The threshold RF amplitude for the transition from superadiabatic to stochastic behaviour is found to be exceeded in present-day experiments. The effect of heating on confinement is evaluated by studying the drift orbit changes due to heating with collisions included through a Monte Carlo method. The results indicate that transport induced by the ion cyclotron range of frequencies (ICRF) could be significant at the higher RF power levels planned for the next generation of experiments. (20 refs.)

66736 The confinement of alpha particles in a slightly asymmetric Tokamak reactor. W.N.G.Hitchon, R.J.Hastie (Culham Lab., UKAEA, Abingdon, England).
Nucl. Fusion (Austria), vol.23, no.4, p.533-5 (April 1983).
The effect of magnetic-field 'ripple' on alpha particles trapped in the major radial variation of the magnetic field in a Tokamak reactor is to make their orbits stochastic so that they can escape from the plasma volume extremely rapidly. A guiding-centre orbit-following code is used to investigate the extent of the stochastic region in a reactor with INTOR parameters, and to compare the results so obtained with the predictions of an analytic map developed by Goldston et al. (1981) to model the banana orbits. Although the analytic map qualitatively reproduces the main trends observed in the guiding-centre orbits, differences in detail occur whose origins are discussed. (2 refs.)

66737 Attainment of reactor level volume-averaged toroidal beta in Doublet III. K.H.Burrell, R.D.Stambaugh, T.R.Angel, C.J.Armentrout, F.P.Blau, G.Bramson, N.H.Brooks, R.W.Callis, R.P.Chase, A.P.Colleraine, J.C.DeBoo, D.R.Eames, S.Ejima, E.S.Fairbanks, J.Fasolo, R.K.Fisher, R.L.Freeman, J.R.Gilleland, R.J.Groebner, R.W.Harvey, C.L.Hsieh, R.Hong, G.L.Jahns, J.H.Kamperschroer, J.Kim, A.J.Lieber, J.M.Lohr, J.L.Luzon, M.A.Mahdavi, F.B.Marcus, D.B.McColl, T.McMahon, T.Ohkawa, N.Ohyabu, D.O.Overskei, P.I.Petersen, T.W.Petrie, W.Pfeiffer, J.M.Rawls, L.Rottler, J.T.Scoville, R.P.Seraydarian, R.L.Silagi, J.R.Smith, R.T.Snider, R.D.Stav, T.S.Taylor, T.N.Todd, J.F.Tooker, J.R.Treglio, D.F.Vaslow, J.C.Wesley, S.S.Wojtowicz, S.K.Wong, G.Zawadzki (General Atomic Co., San Diego, CA, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.535-40 (April 1983).
Using a neutral-beam injection power of 3.4 MW, volume-averaged toroidal betas of up to $\langle\beta_T\rangle=4.5\%$ have been obtained in low-toroidal-field, low-q_ψ, vertically elongated discharges in the Doublet III Tokamak. This level of $\langle\beta_T\rangle$ is above the minimum level required for a Tokamak reactor, thus demonstrating that reactor level values of $\langle\beta_T\rangle$ are possible in a Tokamak device. The observed enhancement of $\langle\beta_T\rangle$ with vertical elongation lends confidence in the design of future devices which rely on vertical elongation. (25 refs.)

66738 Improved theory of collisionless particle motion in stellarators. H.E.Mynick (Univ. of Wisconsin, Madison, WI, USA).
Phys. Fluids (USA), vol.26, no.4, p.1008-17 (April 1983).
A theory of particle motion in stellarators is developed which, in contrast to previous work, is both realistic enough to account for collisionless detrapping, yet simple enough that most features of the orbits can be expressed in analytic, reasonably simple formulas. From the study of detrapping, a systematic, complete classification of possible orbit types emerges. The theory is valid for a class of stellarator configurations which contains the standard model traditionally envisaged, as well as somewhat more complex configurations recently found to have favorable transport properties. The reasons for the differences in transport between configurations are elucidated. (13 refs.)

66739 Effects of ambipolar potential on multiple mirror confinement. F.Najmabadi, A.J.Lichtenberg, M.A.Lieberman (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).
Phys. Fluids (USA), vol.26, no.4, p.1018-27 (April 1983).
The diffusion model for multiple mirror confinement has previously been limited to devices with a large number of cells and high mirror ratios. Ambipolar effects were assumed to reduce the confinement time by the usual factor $[1+Z(T_e/T_i)]^{-1}$. For the ideal multiple mirror regime, in which the mean free path is shorter than the cell length but long compared with the mirror scale length, a new discrete staircase density profile model, without those limitations, has been developed. A theory employing model distribution functions for ion and electron transport in a multiple mirror device has been used. A self-consistent ambipolar potential is included. It has been found that

the ambipolar potential reduces the confinement time somewhat less than the usual ambipolar factor. Special attention is given to the last cell which acts as a boundary condition for the system. The ambipolar potential across the last mirror throat is studied and found to be of the order of 0.3 kT_e. For devices with small numbers of cells, significant improvements over previously calculated multiple mirror confinement times are found. (8 refs.)

66740 Reduction of radial losses in tandem mirrors. J.R.Myra, D.A.D'Ippolito, P.J.Catto (Plasma Res. Inst., Sci. Applications Inc., Boulder, CO, USA).
Phys. Fluids (USA), vol.26, no.4, p.1028-36 (April 1983).
The condition for having strictly omnigenous magnetic fields (zero geodesic curvature and neoclassical step size) is generalized to determine the fields which give the smallest mean square neoclassical step size consistent with given boundary conditions and constraints. Because this transport minimization produces less restrictive field configurations than omnigenity, a wider class of practical applications is possible. An explicit set of ordinary differential equations is obtained for the transport-minimizing vacuum fields in long-thin tandem mirror geometry. Configurations with reduced transport are found at little cost in line averaged interchange stability. Additionally, for these configurations the constraint that no parallel current flow into the center cell (due to the Stupakov effect) may be imposed in a natural way. (17 refs.)

66741 Macroscopic plasma behavior in a high-voltage toroidal theta pinch. D.P.Murphy, G.C.Goldenbaum, C.Chin-Fatt, Y.P.Chong, A.W.DeSilva, H.R.Griem, R.A.Hess, R.L.Merlino (Lab. of Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
Phys. Fluids (USA), vol.26, no.4, p.1061-70 (April 1983).
The behavior of the implosion and post-implosion phases of two different toroidal high-beta plasma configurations has been investigated. The plasma is produced in a nominally axisymmetric toroidal theta pinch in which a Tokamak-like low-beta plasma is heated and compressed to high beta by a fast-rising toroidal field. The two plasma cases differed from each other by the direction of their initial toroidal magnetic field relative to the direction of the main implosion magnetic field. The purpose of this investigation was to determine what factors govern the development and lifetime of the magnetic configuration during the early time post-implosion phase. It was determined from the q profiles for the parallel field case that the plasma should be unstable to the $m=1$ kink mode, i.e. $q<1$, but the normal outward shift of the plasma with respect to the external conducting wall carried it into the internal vacuum chamber wall before the kink could grow to an observable level. The magnetic fields in the case with the initial toroidal field antiparallel to the main implosion magnetic field exhibited nonaxisymmetric behavior. (13 refs.)

66742 Generation of astron-spherator configuration. K.Narihara, M.Hasegawa, Y.Tomita, T.Tsuzuki, K.Sato, A.Mohri.
Report IPPJ-621, Nagoya Univ., Japan (Jan. 1983), 23 pp.
It is experimentally demonstrated that the Astron-Spherator configuration is formed by injecting a pulsed relativistic electron beam in a toroidal device SPAC-VI with external toroidal and vertical magnetic fields. A plasma is confined in the extended magnetic region produced by a slender core of current carrying energetic electrons. This configuration continued for 40 ms without fatal instabilities. (16 refs.)

66743 Method of Abel inversion for non-circular Tokamak geometrics. N.G.Demas, R.P.Howard, M.E.Plemmons (Tennessee Technol. Univ., Cookeville, TN, USA).
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.430-3
A mathematical system is developed for converting line integral experimental data into a point wise distribution (an 'Abel inversion'). The zero boundary location must be given, but it need not be circular. Plasma particles in the ISX-B Tokamak at Oak Ridge are magnetically confined in such a way that a cross-section of the plasma has a D-shaped boundary. Of interest is the distribution of plasma electrons over this cross-section of plasma particles. Previous work has approximated the D-shape by a more or less appropriate circular cross-section. The purpose of this paper is to develop a mathematical system using D-shaped boundary conditions that will yield point wise information from experimental values of integrals obtained through plasma diagnostics of the Tokamak system; specifically, the line integral density as measured by a laser beam phase shift. 52.60 RELATIVISTIC PLASMA

66744 Symmetry of the complete second-order nonlinear conductivity tensor for an unmagnetized relativistic turbulent plasma. H.E.Brandt (US Army Electronics Res. & Dev. Command, Harry Diamond Labs., Adelphi, MD, USA).
J. Math. Phys. (USA), vol.24, no.5, p.1332-8 (May 1983).
A new exact symmetry is proved for the complete second-order nonlinear conductivity tensor of an unmagnetized relativistic turbulent plasma. The symmetry is not limited to principal parts. If Cerenkov resonance is ignored, the new symmetry reduces to the well-known symmetry related to the Manley-Rowe relations, crossing symmetry, and nondissipation of the principal part of the nonlinear current. Also, a new utilitarian representation for the complete tensor is obtained in which all derivatives are removed and the pole structure is clearly exhibited. (57 refs.)

52.70 PLASMA DIAGNOSTIC TECHNIQUES AND INSTRUMENTATION

66745 Spectroscopic studies of the hollow cathode discharge. W.Zyrnicki, E.Osinska (Tech. Univ. of Wroclaw, Wroclaw, Poland).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B32, no.11, p.1303-4 (1982).
The excitation temperatures of plasma produced in a hollow cathode discharge have been determined from relative intensities of ArII and FeI lines. The intensity ratios of some analytical line pairs have been investigated. The authors determine plasma temperature by measurements of ArII and FeI line intensities and investigate the intensity ratios of some analytical line pairs. (9 refs.)

66746 Damping of the plasma resonance of a probe in a drifting Maxwellian plasma. V.Fiala (Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B32, no.11, p.1305-6 (1982).
The response of a probe (small antenna) to harmonic excitation depends on its relative motion with respect to the plasma and this effect may be useful in determining plasma drift velocity. The results of computation of the real part of the transfer impedance of a symmetric probe are presented. (1 ref.)

66747 Langmuir probe characteristic modulated with random fluctuations. K.Matsumoto, M.Sato (Dept. of Electrical Engng., Yamagata Univ., Yamagata, Japan).
J. Appl. Phys. (USA), vol.54, no.4, p.1781-6 (April 1983).
Distortion of the Langmuir probe characteristic due to random fluctuations is investigated theoretically and experimentally. A statistical method is newly introduced to reasonably take account of the effects of statistically random processes. When the fluctuations in the plasma parameters and the current flowing to a Langmuir probe are ergodic, the time-averaged probe current is obtained by taking an ensemble average of the probe current weighted by the probability density function of fluctuating parameters. Therefore, the analysis is valid only for fluctuation spectra with frequencies small compared with the ion plasma frequency. Calculations are made for the distortion of the electron probe current due to Gaussian or periodic fluctuations in number density, space potential, and electron temperature. Previous results based on the usual time average can be deduced from the statistical method as special cases. The method is also examined experimentally by applying broadband Gaussian or periodic potential fluctuations to the plasma of a mercury discharge tube. It is found that Gaussian fluctuations in the plasma parameters bring about greater distortion to the electron probe characteristic than periodic ones, such as sinusoidal, rectangular, triangular waves. (9 refs.)

66748 Limitation of the accuracy of interferometrically measured electron density profiles of laser-produced plasmas. M.D.J.Burgess, G.B.Gillman, B.Luther-Davies (Dept. of Engng. Phys., Australian Nat. Univ., Camberra, Australia).
J. Appl. Phys. (USA), vol.54, no.4, p.1787-91 (April 1983).
Using a double pulse ultraviolet holographic interferometer the authors have investigated the effects of interferometer focusing accuracy on the measured density profiles in an experimental study of plasmas generated by 20-ps duration neodymium laser pulses on carbon fiber targets. They have found that in accordance with predictions made previously using computer models the critical density region can only be measured accurately in very small spherical plasmas when the interferometer focusing error is less than about 5 μm. (10 refs.)

66749 The oscillation of the trapped flux in the early phase of a reversed field θ-pinch. Chen Wu, Y.Aso, S.Himeno, S.Yamaguchi, M.Okamoto, K.Hirano (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1215-23 (April 1983).
Magnetic probe measurements show that the flux trapped into the neutral sheet radius at the early phase of the reversed field θ-pinch does not decrease monotonically but the two humps appear. The first one is coincident with the formation of the collisionless shock wave while the second one with its reflection at the center. The most probable origin of the electromotive force for these humps may be in the large rotational velocity difference between hydrogen ions and impurities. In the first hump the velocity difference may be excited by the ion runaway (Gurevich) effect coupled with the imploding plasma. In the second hump it may be due to large off diagonal element $P_{r\theta}$ of the ion pressure tensor created at the time of the reflection. (24 refs.)

66750 Measurement of small-scale density fluctuation in JIPP T-II plasma by millimeter and sub-millimeter wave scattering. T.Tetsuka, A.Nishizawa (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan), T.Sakai, K.Kawahata, A.Mase, T.Tsukishima, J.Fujita.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1242-50 (April 1983).
The small-scale density fluctuations have been studied by both millimeter (2 mm) and sub-millimeter (337 μm) wave scattering technique in JIPP T-II plasmas. Experiments were performed in two types of plasma: tokamak and stellarator plasmas. In both plasmas, the density fluctuations are localized in the outer region of the plasma column, and show the characteristics of the drift wave mode turbulence. The density fluctuation level is $\tilde{n}/n_0 \simeq 1$-1.5% around the plasma edge, and this value is inversely proportional to the mean electron density. Further, the dependence of the fluctuation level on the plasma parameters is studied and compared with the scaling law of the energy confinement time of the plasma. The diffusion coefficient estimated from the density fluctuation is about one third of the global diffusion coefficient.

66751 Radial density distribution of excited atoms in a surface-wave-produced Ar-O_2 plasma column. A.Ricard, D.Collobert, M.Moisan (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada).
J. Phys. B (GB), vol.16, no.9, p.1657-65 (14 May 1983).
The radial density distribution of Ar I and O I excited atoms in a radiative state and Ar($^3P_2$) metastable atoms in an Ar-O_2 cylindrical plasma column

produced by an electromagnetic surface wave is examined experimentally. The radial density distributions of the Ar($^3P_2$) metastable atoms and that of the O I radiative atoms are nearly flat, whereas the radial variation of Ar I radiative atoms can have a deep minimum on the plasma column axis. The difference in radial profiles leads to the conclusion that the atomic number density in the O(3^3P) level is the result of a two-step process, viz. dissociation of the O_2 molecule and excitation of the ground-state atomic oxygen, this process being caused by Ar($^3P_2$) metastable atoms (rather than by electrons) successively colliding with O_2 and O. The results in Ar-OI_2 are compared with observations made in Ne-O_2. (20 refs.)

66752 Measurement of plasma conductivity using Faraday rotation of submillimeter waves. P.J.Kuzmenko, S.A.Self (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
J. Energy (USA), vol.7, no.2, p.176-81 (March-April 1983).
This paper examines the application of Faraday rotation to the measurement of electron concentration in combustion MHD plasmas. Details on the design of a working system are given, including the selection of operating wavelength. A theoretical comparison between the Faraday rotation technique and two-path interferometry shows Faraday rotation in its simplest form to be somewhat less sensitive to changes in electron concentration. This deficit can be balanced against greater immunity to vibration and thermal drift. Improved techniques of measuring the rotation angle promise greater sensitivity. A preliminary experiment has verified the technique. (13 refs.)

66753 Edge-plasma properties of the UCLA Tokamaks. S.J.Zweben, R.J.Taylor (Center for Plasma Phys. & Fusion Engng., Univ. of California, Los Angeles, CA, USA).
Nucl. Fusion (Austria), vol.23, no.4, p.513-28 (April 1983).
Probe measurements of the edge plasmas of the Macrotor and Microtor Tokamaks are described. Limiter scrape-off layer thicknesses as measured with Langmuir probes are for Macrotor $\lambda \simeq 7$-10 cm and for Microtor $\lambda \sim 1$ cm, both values being consistent with the Bohm diffusion rate. Heat deposition measured with thermocouples attached to small probes shows an anomalously high heat flux, particularly from the electron drift direction. It is argued that the anomalous particle diffusion is most likely associated with the large edge density fluctuations, while the anomalous heat flux is most likely due to a directed high-energy electron population. (59 refs.)

66754 Evolution of the $m=1$ tearing mode during internal sawtooth disruption. P.Smeulders (Max-Planck-Inst. fur Plasma Phys., Garching, Germany).
Nucl. Fusion (Austria), vol.23, no.4, p.529-32 (April 1983).
With an ultra-soft X-ray pinhole camera installed on the Wendelstein VII-A stellarator, changes of the plasma topology have been measured for various plasma conditions over several years. A recently finished tomography computer code, specifically written for pinhole cameras, has yielded detailed information about the time evolution and structure of tearing modes during internal and external disruptions. The features of the $m=1$ tearing mode during an internal sawtooth disruption in a current-carrying stellarator plasma during neutral beam injection are presented. (9 refs.)

66755 Absorption of intense gaussian electromagnetic radiation in a magnetoplasma via inverse bremsstrahlung. K.P.Maheshwari, G.Tarey, R.K.Tiwari (Dept. of Phys., Government Coll., Kota, India), R.P.Sharma.
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.623-35 (Nov. 1982). [received: April 1983]
A self-focused Gaussian laser beam propagating in the direction of static magnetic field in a collisional magnetoplasma has been considered. The explicit expressions for the time averaged power absorbed for left and right handed circularly polarised waves have been obtained. The effect of magnetic field and focusing on the rate of powder absorbed is studied in weak field regime ($\nu_E \ll \nu_{Th}$) as well as strong field regime ($\nu_E \gg \nu_{Th}$). (15 refs.)

66756 Accuracy of mass spectrometric low-temperature plasma diagnostics. S.L.Pozharov (Inst. of Nuclear Phys., Acad. of Sci., Tashkent, Uzbek SSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1327-30 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2156-62 (Nov. 1982). [received: May 1983]
The author discusses a method for selecting ions from a high-pressure plasma which is optimal in terms of minimizing distortions. A simple model is suggested for describing the perturbed plasma adjacent to the outlet. The mass flow and chemical reactions involving the ions are treated to determine how the plasma near the outlet influences the accuracy of mass spectrometric measurements. The relation between the ion density in the unperturbed plasma and the ion currents at the outlet is determined for several ion selection regimes. Dimensionless equations are found which relate the experimental parameters under different ion-selection conditions. (11 refs.)

66757 Reconstruction of the structure of the X-ray spectrum of a laser plasma by mathematical processing. N.Yu.Bakaev, N.G.Basov, V.P.Varava, A.I.Veretennikov, E.I.Ershov, M.P.Kalashnikov, Yu.A.Mikhailov, A.V.Rode, G.V.Sklizkov, R.P.Tarasov, S.I.Fedotov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1378-83 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2119-26 (Nov. 1982). [received: May 1983]
A method is suggested for the reconstruction of the structure of an X-ray spectrum broadened by the influence of a plasma source and by the recording channel. The new method requires less calculation time than the previous methods for the processing of experimental data involving local regularization. This advantage is due to a numerical procedure of the reconstruction method based on a semigroup scheme. The application of the new method in the reconstruction of the k and j satellites of the He-like Al XII ion in the X-ray spectrum of a laser plasma observed in the Delfin facility ensured an improvement in the spectral resolution by a factor of 2-5. 52.75 PLASMA DEVICES AND APPLICATIONS

(see also 28.52 Fusion reactors, 86.30L Electrogasdynamic and magnetohydrodynamic conversion; for ion sources, see 29.25 Particle sources and targets)

66758 Spectroscopic Doppler-free methods for measuring the electric and magnetic fiels in magnetically insulated ion diodes. Y.Maron, C.Litwin (Lab. of Plasma Studies, Cornell Univ., Ithaca, NY, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2086-92 (April 1983).
A two-photon absorption technique is proposed for the measurement of the Stark shift and the Zeeman splitting of the ion energy levels in the diode acceleration gap of a magnetically insulated ion diode for the purpose of determining the local electric and magnetic fields. Various measurement schemes are discussed. The required laser power and linewidth are estimated and found to be attainable by the present day lasers. A measurement of the ion transverse velocities in the diode gap is also proposed. (20 refs.)

66759 Langmuir probe measurements on CHF_3 and CF_4 plasmas: the role of ions in the reactive sputter etching of SiO_2 and Si. C.Steinbruchel (RCA Ltd., Zurich, Switzerland).
J. Electrochem. Soc. (USA), vol.130, no.3, p.648-55 (March 1983).
Langmuir probe measurements on CHF_3, CF_4, CF_4-H_2 and CF_4-O_2 plasmas with concurrent etch rate measurements on SiO_2 and Si have been made in a reactive sputter etching system. At an RF power of 300 W and a pressure of 15 mTorr, the ion density is typically 1.5×10^{10} cm^{-3}, the electron temperature 2 eV, the plasma potential 30 eV, and the ion energy (i.e. the sheath potential) of the order of 500 eV. The dependence of these parameters on RF power, pressure, reactor geometry, and plasma gas composition is investigated, as well as the spatial uniformity of the plasma. For SiO_2, etch rates vary essentially in proportion to ion densities with all the different plasmas. For Si in CF_4-O_2 plasmas, the anisotropic part of the etch rate also parallels the ion density. From the measured ion densities the ion flux to the substrate is estimated. Thus, etch rates per ion can be determined, which turn out to be similar to those in reactive ion beam etching, although in reactive sputtering etching ion energies are much smaller. (37 refs.)

66760 Analytical investigation of axial field limitations in MHD generators. W.Unkel, C.H.Kruger (Stanford Univ., Stanford, CA, USA).
J. Energy (USA), vol.7, no.2, p.97-8 (March-April 1983).
Electrical breakdown of the interelectrode insulator gap of an MDH generator is represented by a time-dependent thermal and electrical model for the regions. Predicted results for a simplified configuration are in general agreement with available experimental data. MHD generator electrode wall design philosophies are evaluated. (9 refs.)

66761 Cross-sectional current distribution in coal fired diagonal conducting wall MHD generator. A.R.Kumaran, B.L.Liu, Y.C.L.Wu (Univ. of Tennessee Space Inst., Tullahoma, TN, USA).
J. Energy (USA), vol.7, no.2, p.112-17 (March-April 1983).
Current distribution in the cross-sectional plane of a diagonal conducting wall MHD generator with slag coated walls, is studied. The effects of boundary layer thickness and wall temperature on the current distribution and power output are investigated for magnetic fields of 2 and 6 T. The effect of sidewall boundary layer overshoot is also considered. For a cold wall there is substantial current flow to the sidewalls, whereas for a hot wall there is much less such a trend. The change in the thickness of the turbulent boundary layer has little effect on the current distribution and power output. Increasing the Hall parameter enhances the sidewall current significantly. Power output is strongly dependent on the wall temperature since the voltage drop increases rapidly as wall temperature decreases. The temperature distribution in the slag layer varies with the current density for a specified wall temperature. There is no substantial current leakage through the slag layer between the various electrodes along the sidewall in all the cases considered. The power output from the present investigation compares well with the experimental results and also with three-dimensional results. (17 refs.)

66762 MHD channel electrical boundary-layer theory and applications. S.A.Zwick, E.D.Doss, Y.C.Pan, S.E.Shamma (Argonne Nat. Lab., Argonne, IL, USA).
J. Energy (USA), vol.7, no.2, p.118-27 (March-April 1983).
Analytical methods are developed for calculating the potential and currents near boundary singularities caused by electrode edges or abrupt drops in conductivity or in the induction field. A three-dimensional control volume (finite-difference) model which applies the analysis for solving the magnetohydrodynamic electrical problem in oblique coordinates has been developed. The model accounts for the near-wall singular behaviour accurately and can be used with relatively sparse grids to study channels with diagonal sidewall conductors. Analyses based on the model indicate that, for practical generator design where the electrode pitch is on the order from 1 to 5 cm and the wall temperature less than 2100K, the performance of diagonal conducting wall channels is always superior to that of channels with insulating sidewalls, although the performance of insulating sidewall channel is better at higher wall temperatures. Sidewall electrode extensions up to a wraparound of about 20% of the channel height are shown to cause an increase in power output. The power output of diagonally connected channels remains approximately the same for more than 20% wraparound, whereas the power output of Faraday channels drops off with further extensions of the sidewall conductors. (11 refs.)

66763 End effect in segmental channel. S.M.Barbarash, V.A.Golodnyak, S.Yu.Reutskii, I.M.Tolmach.
Magnetohydrodynamics (USA), vol.18, no.3, p.304-8 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.111-14 (July-Sept. 1982). [received: April 1983]
Design of MHD devices with segmental channels necessarily involves study of the characteristics of a given machine in the end zone near the current-feeding electrodes and in the region of dropping intensity of the applied magnetic field. One such problem has already been solved. For high-voltage MHD pumps, however, the formulation of the problem in that study does not adequately describe the real processes in a machine. Specifically, it does not account for the finite resistance of connecting jumpers and does not include the insulating gaps which separate a current-feeding electrode from the segmental channel part. The problem of the end zone in a segmental channel with an isotropically conducting medium is solved in the two-dimensional formulation and in the inductionless approximation. (5 refs.)

66764 Experimental study of conduction-type MHD-channel operating with electrolyte. A.P.Vasil'ev.
Magnetohydrodynamics (USA), vol.18, no.3, p.315-21 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.122-8 (July-Sept. 1982). [received: April 1983]
Channel-type MHD conduction motors with superconducting magnets can operate as high-efficiency thrust engines. The energy characteristics and efficiency of these motors were, however, calculated without taking into account the evolution of gases at the electrodes resulting from electrolysis of sea water. The need to study these processes is dictated by the designers' endeavor to increase the thrust delivered per unit volume of the magnetic field, a very important performance parameter of an MHD motor. Achieving this will make it possible to decrease the volume of the MHD channel as well as the mass and the size of the superconducting magnet system, but will also increase the operating current density in the channel and thus the volume fraction of gaseous phase in the latter. A higher bubble content in the carrier stream results in a velocity imbalance between phases and in a lower effective electrical conductivity of the working substance, accompanied by additonal losses of electrical and mechanical power in the channel with attendant lowering of the motor efficiency. (8 refs.)

66765 Photographic study of voltage breakdown over an insulator in a hypocycloidal pinch. D.R.McFarland (NASA Langley Res. Center, Hampton, VA, USA), J.H.Lee.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.444-7
In order to improve the discharge uniformity in a multiple-stage hypocycloidal pinch (HCP) that is used as a laser pump source, the initial breakdown over an annular surface of the insulator in the HCP was investigated by fast photography. This study was made using a single pair of electrodes with variations in electrode configurations, insulator markings, gas medium in pressures (1 to 500 kPa), and electrode potential (2 to 10 kV). The heavier gases, such as Xe and Ar, higher gas pressures (above 100 kPa), and higher potentials gave more uniform discharges. Also, the initial breakdown was highly affected by radial conductive markings spaced around the insulator. (3 refs.)

66766 Mass spectrometry of high pressure arcs in air and SF_6. W.Ruegsegger, F.K.Kneubuhl (Dept. of Phys., ETH, Zurich, Switzerland), H.J.Schotzau.
Appl. Phys. B (Germany), vol.B31, no.1, p.9-13 (May 1983).
For the development of SF_6 pufferbreakers it is important to gain insight into the chemical composition of the SF_6 gas during the high-current period as well as close to current zero. For this reason a mass-spectrometric sampling system is presented which allows dynamic measurements of chemical reactions occurring in high-pressure arcs. Results of mass-spectroscopic investigations on a DC and a pulsed arc are presented. (13 refs.)

66767 Characteristics of a discharge in a He-CO_2-Cs mixture and their effects on the rate of chemical combination of cesium. V.A.Sinel'shchikov (Inst. of High Temperatures, Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.517-24 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.627-35 (July-Aug. 1982). [received: April 1983]
The discharge plasma in a He-CO_2-Cs mixture has been examined with partial pressures for the components of $pHe=2.7$ kPa and $pCO_2=(0\text{-}270)$ Pa, and atomic cesium concentrations in the range $N=(10^{10}\text{-}2\times10^{13})$ cm^{-3}. It has been found possible to obtain a quasistationary plasma in a He-CO_2-Cs mixture with an atomic cesium concentration sufficient to affect the electron concentration and temperature. Measurements have been made of the characteristic combination times for the cesium in the discharge. (11 refs.)

66768 Voltage drop at the cathode of a glow discharge at moderate pressures in nitrogen and in a mixture of CO_2-laser gases. A.I.Ivanchenko, A.A.Shepelenko (Inst. of Theoretical & Appl. Mech., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.525-30 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.636-41 (July-Aug. 1982). [received: April 1983]
It is shown, using theoretical estimates which are confirmed experimentally, that the magnitude of the voltage drop of a glow discharge at the cathode can be measured at moderate pressures by calorimetrically measuring the heat evolved on the cooled cathode. Measurements are reported in a CO_2:N_2:He mixture and in N_2 at different discharge currents. (8 refs.)

66769 Normal glow discharge burning regime. V.I.Myshenkov (Inst. for Mech. Problems, Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.530-5 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.642-8 (July-Aug. 1982). [received: April 1983]
The nature of the normal burning regime for glow discharges is investigated. The effects of gas heating mechanisms on the structure of the cathode layer are studied. At relatively low pressures when heating of the gas in the cathode layer is not substantial, simple equations are derived to give the width of the cathode layer, size of the cathode voltage drop, and normal current density. All the values thus obtained are in agreement with experimental data. (9 refs.)

66770 Experimental study of an axial discharge in a turbulent gas flow. A.V.Bondarenko, F.V.Lebedev, M.M.Smakotin, V.B.Flerov (I.V. Kurchatov Atomic Energy Inst., Moscow, USSR).
High Temp. (USA), vol.20, no.4, p.536-9 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.649-52 (July-Aug. 1982). [received: April 1983]
The electric field intensity distribution is studied in an extended small-field discharge in nitrogen. Expressions are obtained for the dependences of the electric field gradient on pressure, flow velocity, current density, turbulent diffusion factor, and discharge tube diameter which are in good agreement with theoretical treatments of the mechanism by which current passes into the extended region of a small field. The results may be of use in studying stability of axial discharges. (8 refs.)

66771 Experimental evidence of non-inverted population in a neon hollow-cathode. T.Caesar, J.-L.Heully (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Opt. Commun. (Netherlands), vol.45, no.4, p.258-60 (15 April 1983).
By the use of two step excitation from the $(2p^5\ 3s)^1P_1$ state of neon very large enhancements of the optogalvanic signals were obtained. This proves that no inverted population between the levels $2p_{1,2,3,4,5}$ and $^1P_1$ occurs as it was proposed in a recent paper. A new explanation of the inverted optogalvanic signals obtained for transitions originating from this $^1P_1$ state is proposed. (4 refs.)

66772 Test wave diagnostics in the afterglow of a microwave discharge. G.Derra, A.Piel (Inst. fur Experimentalphys. II, Ruhr Univ. Bochum, Bochum, Germany).
Plasma Phys. (GB), vol.25, no.4, p.435-46 (April 1983).
The plasma parameters n_e, T_e, T_i of a microwave produced plasma are investigated using resonance cones and ion acoustic waves. Both methods were refined to make possible time resolved measurements during the afterglow. The electron densities derived from resonance cones agree well with microwave interferometry. The ion acoustic wave method results in much lower electron temperatures than Langmuir probes. This behaviour is attributed to high concentrations of molecular ions, which reduce the ion acoustic speed. (16 refs.)

66773 Current-voltage characteristics of a high-current discharge in nitrogen. V.S.Borodin, O.P.Nechesov, F.G.Rutberg (All-Union Sci.-Res. Inst. for Electrical & Mech. Engng., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1324-7 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2150-5 (Nov. 1982). [received: May 1983]
A model is suggested for high-current discharges under high pressure initiated by an exploding wire in nitrogen when energy is supplied by an inductive power source. The pulse length and current pulseform in such discharges permit the use of a quasistationary model. It is shown that if a constantan wire is exploded, the discharge may be considered to consist of two zones—a central zone in which the temperature is weakly dependent on the radial distance, and a wall region, where the temperature drops abruptly. Calculated values of the conductivity are compared with experimental findings for currents in the range 10-90 kA at initial pressure 2 MPa, and satisfactory agreement is obtained. (10 refs.)

66774 Experimental investigation of the characteristics of a planar surface discharge. V.M.Borisov, A.M.Davidovskii, O.B.Khristoforov.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1403-8 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2159-67 (Nov. 1982). [received: May 1983]
An investigation was made of the optical and electrical characteristics of a planar surface discharge suitable for use in lasers. The optimal times and discharge input energies were determined for which the efficiency of conversion of electrical energy into 240-340 nm ultraviolet radiation energy was 5.5, 3.5, and 1.25% respectively, for $Xe:F_2=10:1$, $Ar:F_2=10:1$, and $He:F_2=10:1$ gas mixtures at atmospheric pressure. A chemical laser system was proposed employing initiation by a planar surface discharge. The possibility was investigated of increasing the fraction of ultraviolet radiation by forming excimer complexes of the type KrF* and XeCl* in the surface discharge plasma. For an $HCl:Xe:Ar=1:1:30$ gas mixture the surface-discharge optical radiation came predominantly from the excimer molecules when the specific input energy was <5 mJ/cm^2. The possibility was demonstrated of utilizing a surface discharge in excimer flashlamps of high repetition frequency (up to ~10 kHz) and emitting ultraviolet radiation of surface power density ~0.3 W/cm^2. (5 refs.)

66775 Breakdown prediction in compressed SF_6. G.C.Crichton, I.W.McAllister, A.Pedersen, S.Vibholm (Dept. of Phys., Tech. Univ., Lyngby, Denmark).
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.1/1-13
The derivation of the streamer breakdown criterion is described. The criterion is formulated to take account of the inherent features of the effective coefficient of ionization $\bar{\alpha}$. The evaluation of the parameters necessary for the application of the criterion to SF_6 is undertaken. The utilisation of the criterion with respect to the effect of electrode surface roughness on the insulation strength is discussed. Particular reference is made to the limitations inherent both in the modelling procedure adopted and in the use of the breakdown criterion. (7 refs.)

66776 Flashover on a solid resistance surface. C.Huraux, G.Peyregne, A.Rahal (Lab. de Genie Electrique, Univ. Paul Sabatier, Toulouse, France).
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.2/1-12
Measurements carried out on a laboratory model clarify the essential role of the atmosphere in which the discharge burns while lengthening. Time-to-flashover characteristics reinforce the hypothesis of two mechanisms for discharge root propagation. One is a force dragging the discharge when applied voltage just exceeds the flashover voltage. The other occurs at much higher voltages and consists of successive breakdowns in the atmosphere above the pollution. (12 refs.)

66777 The influence of metallic particles and contamination on the DC flashover of epoxy resin spacers in air and SF_6. G.Grannstrom, E.San Roman (Royal Inst. of Technol., Stockholm, Sweden), A.E.Vlastos.
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.3/1-11
The influence of metallic particles (copper wires 0.1-0.5 mm in diameter 0.75-3 mm long) and mineral oil smears adhering to the surface of a flat disc spacer was examined. The measurements in air were made at atmospheric pressure (1 bar_a) with the spacer mounted between two coaxial cylindrical Al electrodes with diameters of 155/42 mm. The measurements in SF_6 were made at low pressures (0.1-0.5 bar_a) with the spacer mounted as in air and at pressures 0.2-2 bar_a with the effective diameter of the spacer reduced by using an outer electrode with a diameter of 85 mm. (1 ref.)

66778 DC flashover of epoxy resin spacers in air and SF_6. A.E.Vlastos (Tech. Univ. of Denmark, Lyngby, Denmark), E.San Roman, G.Brannstrom.
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.4/1-14
The DC flashover voltage of flat and ridged type epoxy resin spacers was examined at atmospheric pressure (1 bar_a) with the spacers placed between two coaxial Al electrodes with diameters of 155/42 mm and an outer electrode length of 200 mm. Experiments were performed in SF_6 using the same spacers and electrodes at pressures of 0.1 to 0.5 bar_a. Additional measurements were performed when the effective spacer length was reduced by shor-

tening the outer electrode diameter to 85 mm but keeping the inner electrode diameter the same (85/42 mm) at pressures of 0.2 to 2 bar_a. (no refs.)

66779 Flashover along interfaces between solid and liquid insulation. H.Danielsen, L.Lundgaard, M.U.Anker.
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.5/1-11 In Norwegian.
The report presents results from tests of flashover along solid/liquid interfaces (pressboard/transformer oil). The test objects are representative of transformer insulation. The test tank contains 600 l of oil which can be filtered and dried in a closed-loop system, thereby keeping the moisture and particle contents below prescribed limits. The 50 Hz test voltage is increased in steps of 25 kV every minute. Maximum test voltage is 350 kV. During the tests partial discharges are detected and the flashover voltage is recorded. The flashover process is also monitored on a video tape recorder. Test objects with a pressboard/oil interface gave about 14% lower breakdow voltage than a corresponding oil gap with no interface. This result is 'probably significant' according to Student's t test. Some future experiments are discussed. (2 refs.)

66780 An analytical method for indexing X-ray powder patterns of monoclinic substances. Guo Chang-lin, Ma Li-tai (Shanghai Inst. of Ceramics, Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.1, p.1-14 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
A simple and flexible analytical method for indexing X-ray powder patterns of monoclinic substances by using a computer is proposed. The lattice parameter b can be obtained from the repeat number m of δ value of every pair of diffraction lines in δ-m chart and their linear relationship. By the reducing procedure the reciprocal lattice is projected on the a^*-c^* plane and the angle of each pair of reciprocal vectors can be calculated from the Q_{hkl} data of each triplet of reciprocal points. According to the repeat number M in β-M chart the monoclinic angle β can be obtained and then the lattice parameters a and c can be calculated. Finally the indexing of the entire diffraction patterns is made by iterative correction method for indexing powder patterns. The computer program of the analytical method is given. The indexing of two monoclinic substances nickel acetate hydrate ($C_4H_6NiO_4.4H_2O$) and potassium tungstate (K_2WO_4) has been made by using this method, the result proves that the method is fairly applicable. (12 refs.)

66781 Modification of the Stokes method of extracting physical broadening of diffraction lines. L.L.Burkovskaya, I.G.Zakharchenko, O.I.Inozemtsev, I.A.Moroz (Makarenko Sumskii State Pedagogic Inst., USSR).
Ind. Lab. (USA), vol.48, no.7, p.677-80 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.40-2 (July 1982). [received: March 1983]
The problem of regaining the method of Fourier analysis of X-ray line profiles is investigated. A modification of the Stokes method is recommended which produces formulae which are not only free from the errors known to be inherent in such formulae, but also are the simplest, thus shortening the calculation process. (5 refs.)

66782 A nomogram for evaluating the accuracy of determination of the center of gravity of the diffraction line. Yu.D.Yagodkin (Moscow Inst. of Steels & Alloys, Moscow, USSR).
Ind. Lab. (USA), vol.48, no.7, p.680-2 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.42-4 (July 1982). [received: March 1983]
Presents a method of accurate determination of the lattice spacing of crystalline matter based on finding the center of gravity of diffraction lines $2\theta_c$. (2 refs.)

66783 A precision two-crystal X-ray spectrometer for producing oscillation curves. V.E.Panchenko, V.A.Ushakov (Inst. of Nuclear Phys., Acad. of Sci., Novobirsk, USSR).
Ind. Lab. (USA), vol.48, no.7, p.683-7 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.44-7 (July 1982). [received: March 1983]
The described spectrometer contains three separate vertical shafts, i.e., problems of the three-crystal method can also be solved. The shafts are equipped with crystal holders. The first two shafts are assembled on the common platform which can be moved over a large distance along a straight line (with an angular error of $\lesssim 1'$) and secured; the position of the third shaft cannot be changed. The nonparallelism of the axes of rotation of the shafts is $<0.5'$. The angular misalignment of the base walls of the crystal holders with the axes of rotation of the shafts is less than 20″ and the linear misalignment is less than 20 μm. (2 refs.)

66784 Low-angle X-ray camera for the investigation of polymers exposed to loads and ultraviolet radiation. Kh.Akimbekov, A.A.Yastrebinskii (V. I. Lenin Tadzhik State Univ., Dushanbe, USSR).
Ind. Lab. (USA), vol.48, no.7, p.687-9 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.47-8 (July 1982). [received: March 1983]
The camera is based on a collimation system combined with a deflector in order to reduce the background noise, and uses a sharp-focus BSV-10 X-ray tube. The housing of the camera is cylindrical. The camera is opened from the side; which allows all the operations required to be carried out within the camera (installation of the specimen and of the UV source, loading, etc.). A PRK-4 quartz-mercury lamp is used as the source of UV radiation which is supplied from a high-frequency generator with a frequency of 40 MHz and an output of 150 W. (7 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

66787 Fluids of hard diatomic molecules. I. M.S.Wertheim (Math Dept., Rutgers Univ., New Brunswick, NJ, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4619-24 (1 April 1983).
The problem addressed is that of finding the complete orientation-dependent pair distribution function of a fluid of hard diatomic molecules. The treatment decomposes the Mayer f function into several terms and uses a graph-theoretical treatment. The basic idea is the explicit use of molecular geometry in constructing approximations. The fugacity expansion is found to be superior to the density expansion for this purpose. The neglect of large classes of graphs is shown to be exact for extremely asymmetric diatomics and is introduced as a new approximation for the less asymmetric case. Topological reduction of the reduced expansion leads to a result that resembles the density expansion, but contains an additional parameter. An integral equation of Ornstein-Zernike type is derived, and an approximation for closing the equation is suggested. The resulting equations are calculationally tractable and can be used to obtain both the centers correlation function and the higher harmonics of the pair distribution function. The relation to RAM perturbation theory is discussed briefly. (27 refs.)

66788 Fluids of hard diatomic molecules. II. M.S.Wertheim (Math. Dept., Rutgers Univ., New Brunswick, NJ, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4625-31 (1 April 1983).
For pt.I see ibid., vol.78, no.7, p.4619-24 (1982). The author considers fluids of hard diatomic molecules composed of two fused hard spheres of unequal diameter. The orientation average of the Mayer f function and the second virial coefficient B_2 are calculated exactly by analytic integration in closed form. The calculation uses a decomposition of $f(12)$ into five terms. The only difficult term is integrated in tetrahedral coordinates. Agreement with previous numerical results for B_2 is excellent. Two of the five terms make small to moderate contributions to B_2, depending on the molecular parameters. This supports the view that the decomposition is a useful device in formulating approximate theories. The integrals evaluated for the diatomic case are used to obtain B_2 and the orientation-averaged $f(12)$ exactly for a class of linear symmetric triatomic molecules. (10 refs.)

66789 The perturbation theories for the dipolar fluids. L.L.Lee, T.H.Chung (School of Chem. Engng. & Materials Sci., Univ. of Oklahoma, Norman, OK, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4712-20 (1 April 1983).
The authors derive four different perturbation equations for the calculation of the angular pair correlation functions of dipolar fluids; namely, the first order y-expansion, the modified Percus-Yevik (MPY) expansion, the modified hypernetted chain (MHNC) expansion, and the modified linearized hypernetted chain (MLHNC) equation. Both the method of the functional expansion and the method of the cluster integrals are utilized. Comparison with other perturbation theories (e.g. the Melnyk-Smith equation) is made. While none of the theories are exact, as shown by the cluster diagrams, the MLHNC and the MHNC contain more diagrams than, say, the MPY and y-expansion. The y-expansion equation can be improved by including the correction terms to the Kirkwood superposition approximation for the triplet correlation function. For example, the inclusion of the correction term $\rho\int d4h(14)h(24)h(34)$ in a formula given by Henderson (1967), is shown to improve substantially the y-expansion equation. The authors examine the performance of two of the theories: the y-expansion and the MLHNC equation for a Stockmayer (dipolar) fluid with a reduced dipole moment μ^{*2} $[=\mu^2/(\epsilon\sigma^3)]=1.0$. Comparison with Monte Carlo simulation results of Adams et al. (1981) and with other theories (e.g. the QHNC equation) shows that the authors' results are reasonable. Further improvements of the equations are also pointed out. (28 refs.)

66790 Mesoscopic kinetic theory. M.Grmela (Dept. of Chem. Engng., Ecole Polytech., Montreal, Quebec, Canada), W.G.Laidlaw.
J. Chem. Phys. (USA), vol.78, no.8, p.5151-63 (15 April 1983).
Kinetic theory is regarded as a phenomenological theory of macroscopic physical systems. The kinetic equations are constructed as continuity (Liouville) equations corresponding to the time evolution equations of a representative particle subjected to averaged, effective forces. Through the effective forces the unique character of the systems under consideration is expressed. The phenomenological kinetic theory is validated by establishing its relationship to equilibrium thermodynamics and hydrodynamics. A unified approach to the study of relations among dynamical theories formulated on different levels is proposed. (27 refs.)

66791 Mesoscopic kinetic theory of polymer melts. M.Grmela, P.J.Carreau (Dept. of Chem. Engng., Ecole Polytech., Montreal, Quebec, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.5164-74 (15 April 1983).
A novel approach to phase space kinetic theory of dense polymer systems and to the study of their equilibrium and nonequilibrium properties is proposed. Phase space kinetic equations are constructed as continuity equations of the time evolution equation of a representative dumbbell subjected to an averaged field force. A thermodynamic equation of state, an expression for the pressure tensor involving the configuration space distribution function and an equation governing the time evolution of the configuration space distribution function are obtained as three consequences of a single phase space kinetic equation. (28 refs.)

66792 The solution of the MSA for asymmetrical hard ions: the effects of the coupling parameter P_n on the shielding parameter Γ and the structure of the electrolyte solutions. L.L.Lee (School of Chem. Engng. & Materials Sci., Univ. of Oklahoma, Norman, OK, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5270-1 (15 April 1983).
It has been asserted that the value of P_n for dilute electrolyte solutions or for ions of similar sizes is small, and can be neglected in a first approximation. The author tests the validity of the approximation $P_n=0$ for concentrated solutions and ions of different diameters. The authors carried out numerical calculations for concentrated 1-1 electrolyte solutions with a range of Bjerrum lengths B from, e.g., 1 to 32. (4 refs.)

66793 Diffusion in concentrated hard sphere dispersions: effective two particle mobility tensors. I.Snook, W.van Megen (Dept. of Appl. Phys., Royal Melbourne Inst. of Technol., Melbourne, Australia), R.J.A.Tough.
J. Chem. Phys. (USA), vol.78, no.9, p.5825-36 (1 May 1983).
In view of the practical difficulties already encountered plus those anticipated in the implementation of many-body hydrodynamic interactions, the authors examine a number of empirically screened two particle mobility tensors. The empirical screening constant(s), which depend on the dispersion concentration, are adjusted to give the best agreement with available experimental mutual and local self-diffusion constants for concentrated hard sphere dispersions. These diffusion constants are obtained experimentally from the first cumulant of the coherent intermediate scattering function in the small and large wave vector limits. They find that the experimental data can only be satisfactorily reproduced by employing a pair mobility tensor containing two adjustable screening terms. The predictions of the final mobility tensor at intermediate wave vectors are also qualitatively consistent with experiments. (41 refs.)

66794 Kinetic theory of non-equilibrium fluid. E.G.D.Cohen (Rockefeller Univ., New York, NY, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.17-42 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
A survey of the kinetic theory of transport phenomena in simple fluids is presented. The Chapman-Enskog solution of the Boltzmann equation for dilute gases, the Enskog theory for dense gases, and the current theory for moderately dense gases are discussed. Next, a critique of the Green-Kubo formulae for the transport coefficients is presented. After a discussion of the long time tail contributions to the transport coefficients, recent computer simulations of dense fluids under very severe strain rates or high frequencies are compared with present theory. (61 refs.)

66795 Non-equilibrium molecular dynamics calculations of the shear viscosity of hard spheres. J.J.Erpenbeck (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Physica A (Netherlands), vol.118A, no.1-3, p.144-56 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
The coefficient of shear viscosity is computed by two non-equilibrium molecular dynamics methods related to those of Lees and Edwards (1972), Evans (1979, 1980), and Ashurst and Hoover (1977) for hard sphere systems at a fluid density near the solid transition density. One of the methods is isothermal in that it arbitrarily rescales the peculiar velocities. The other permits the system to heat with time. The resulting viscosities are found to agree within the statistical uncertainties for all values of the shear rate studied. Moreover, the non-equilibrium results would appear to be consistent with the zero-shear-rate Green-Kubo results. However, the calculated viscosity shows no evidence for a square-root dependence on shear rate, within the rather large statistical uncertainties, particularly at small shear rate. Moreover, if one deduces a square-root dependence from the previously observed long-time tail of the shear viscosity through the Zwanzig (1981) relation, then these viscosities appear to disagree significantly. (17 refs.)

66796 Linear and nonlinear response in computer simulation experiments [fluid]. G.Jacucci (Phys. Dept., Univ. of Trento, Trento, Italy).
Physica A (Netherlands), vol.118A, no.1-3, p.157-65 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).
Computer simulation experiments on transport properties using perturbation of mechanical trajectories are critically discussed in the light of Van Kampen's (1971) 'case against linear response theory' and of the numerical experiments in the nonlinear region of Visscher (1974), and more recently of Evans (1981). 61.25 STUDIES OF SPECIFIC LIQUID STRUCTURES

(see also 61.40 Amorphous and polymeric materials)

66797 On the MCY potential for liquid water. D.G.Bounds (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.604-6 (22 April 1983).
The fit of the MCY potential to the CI energies of water dimers calculated by Matsuoka, Clementi and Yoshimine (J. Chem. Phys., vol.64, p.1351, 1976) is examined. The MCY potential shows systematic deviations from the data points in all ten directions of approach considered in the earlier calculation. A new fit is given which is much closer to the CI energies. Molecular dynamics simulations show that the original CI data lead to a poorer liquid structure than the MCY fit suggests. (10 refs.)

66798 Chloro-complexes formation in a $ZnCl_2$-$CdCl_2$ aqueous solution: an X-ray diffraction study. G.Paschina, G.Piccaluga, G.Pinna (Istituto Chimica Fisica e Industriale, Univ. di Cagliari, Cagliari, Italy), M.Magini.
J. Chem. Phys. (USA), vol.78, no.9, p.5745-9 (1 May 1983).
A solution containing 1 mol/*l* of $ZnCl_2$ and $CdCl_2$ was examined by X-ray diffraction in order to study the mean environments of the two cations. The results were compared with those obtained from two solutions in which the same salts were separately dissolved Zn^{2+} ions turned out to be hexa-coordinated both in the single and the mixed solution, the coordination shell being composed of about five water molecules and one Cl^- ion. On the other hand, Cd^{2+} ions, which in the $CdCl_2$ solution are nearly hexa-coordinated, become tetracoordinated, in the mixed solution. This transition is accompanied by a significant increase of the Cd^{2+}-Cl-complexation degree. (27 refs.)

66799 Thermodynamic perturbation theory for molecular liquid mixtures. J.Fischer, S.Lago (Inst. fur Thermo- und Fluiddynamik, Ruhr-Univ., Bochum, Germany).
J. Chem. Phys. (USA), vol.78, no.9, p.5750-8 (1 May 1983).
A weeks-Chandler-Andersen type (1971) perturbation theory for the Helmholtz energy of mixtures consisting of molecules with nonspherical cores is given. The correlation functions are obtained from a reference mixture of softly repulsive spherical particles. For that mixture the Percus-Yevick equation is solved with Baxter's formalism. By a blip expansion a hard convex body system is determined for which the free energy is obtained from Boublik's equation. For one-center Lennard-Jones liquids, the excess properties for mixtures agree with simulation results as good as those of the Baker-Henderson (1976) and the variational theory, while the pure substance properties are obtained better now. For mixtures of one-center and two-center Lennard-Jones liquids, the excess volumes and the excess enthalpies are given for argon/nitrogen and argon/oxygen after fitting the unlike pair interaction to the experimental value of the excess Gibbs energy. The results resemble those obtained from simpler theories, but discrepancies with reported experimental data remain. (44 refs.)

66800 HNC solution for the central force model for liquid water. R.A.Thuraisingham, H.L.Friedman (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5772-5 (1 May 1983).
Beginning with the central force model for water introduced by Lemberg, Stillinger, and Rahman (1975), the HNC approximation method has been used to calculate the atom-atom pair correlation functions of a state of liquid water. Although a stable and accurate solution to the HNC equation for the model is obtained using the Rossky-Dale algorithm, the structure and thermodynamics agree only crudely with the published molecular dynamics results for the same model and the same N, V, T state. (25 refs.)

66801 Ab initio interatomic potential curves for $NaNO_2$ and the simulation of the molten salt. J.D.Goddard, M.L.Klein, Y.Ozaki (Chem. Div., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1168-72 (April 1983).
Ab initio potential energy curves are presented for $(Na^+)(NO_2^-)$ as a function of the Na-N separation. The minimum energy configuration is similar to that observed in the room temperature ferroelectric solid. Empirical atom-atom potential energy functions based in part on the ab initio calculations, are used in a molecular dynamics computer simulation of the molten salt.

66802 A group interaction model for liquids. Application to liquid n-alkanes and n-alkane+n-alkane liquid mixtures. V.Perez Villar, R.Bravo, M.I.Paz Andrade (Dept. de Fisica Fundamental, Univ. de Santiago de Compostela, Santiago de Compostela, Spain).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.2, p.225-32 (Feb. 1983).
Based on Flory's ideas about functional groups, a statistical model for liquids has been developed. This model is characterised by some parameters permitting an adequate description of the properties both of the pure liquids as well as their mixtures. The results obtained by applying this model to systems composed of n-alkanes and their mixtures show a reasonably good agreement with experimental data for volumes, thermal expansion coefficients and thermal pressure coefficients, as functions of temperature. (19 refs.)

66803 A qualitative analysis of the radial distribution functions of water on the basis of the model of a continuous random tetrahedrally coordinated network. V.I.Korsunskii, Yu.I.Naberukhin (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.400-7 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.92-100 (May-June 1982). [received: Feb. 1983]
The radial distribution functions (RDF) of water at temperatures in the range 4-200°C, obtained using procedures which eliminate the basic errors of the numerical Fourier transformation, have been given. A significant improvement in the quality of the RDF in the range of the large intermolecular distances has been achieved. It follows from an analysis of the RDF that the structure of water at all temperature represents a continuous random four-coordinated network of hydrogen-bonded molecules. At low temperatures, the main role in the production of the structure of the network and the form of the RDF is played by the directed character of the H-bonds (on the average tetrahedral coordination of water molecules) and the formation of rings of connected molecules. At temperatures above 100°C, the directed character of the bonds and the molecules. At temperatures above 100°C, the directed character of the bonds and the tetrahedral coordination disappear as a result of very large deviations from linear geometry of the H-bonds, but, as at low temperatures, each molecule is joined to four nearest neighbors. (26 refs.)

66804 Anisotropic solutions of methylol cellulose. P.A.Patton, R.D.Gilbert (Dept. of Textile Chemistry., North Carolina Univ., Raleigh, NC, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.515-22 (April 1983).
Methylol cellulose solutions in dimethylsulfoxide exhibit a viscosity maximum at 18% w/v followed by a minimum at 20%, as is characteristic of lyotropic liquid crystals. The biphasic solutions exhibit areas of clear and cloudy appearance. The latter are birefringent. The highly anisotropic solutions are uniformly birefringent and in the 25-33% w/v concentration region they are brightly coloured. The optical rotations of the mesomorphic phases are high, indicating a cholesteric structure. The sign of the optical rotation depends on the solution concentration and at high concentrations (25+% w/v) varies with the area of the solution viewed. (11 refs.)

66805 Liquid structure of ammonia—a case of Apollo model of orientation for pyramidal molecules. R.V.Gopala Rao, B.M.Satpathy (Phys. Chem. Section, Jadavpur Univ., Calcutta, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.599-605 (Nov. 1982). [received: April 1983]
The Apollo model of Egelstaff et al. (1971) for the orientation of tetrahedral AB_4 type molecules has been extended to study the liquid structure of AB_3 type pyramidal molecules like ammonia. With a suitable choice of diameter to calculate the centre structure function through a hard sphere potential, the molecular structure function has been evaluated and compared with experimental X-ray diffraction results. From the experimental molecular structure function, the intermolecular angle-averaged potential and other centre correlation functions have been evaluated. (17 refs.)

61.25M Liquid metals

66806 Temperature dependence of the structure factor of liquid metals. R.N.Joarder (Dept. of Phys., Jadavpur Univ., Calcutta, India), R.V.Gopala Rao.
Phys. Status Solidi b (Germany), vol.116, no.1, p.299-306 (1 March 1983).
An expression for temperature dependent packing density is obtained and it is shown that this temperature dependent packing density can account the temperature dependence of structure factor, self-diffusion coefficient, and shear viscosity with good accuracy. Other observations at higher temperatures also confirm this procedure. (25 refs.)

66807 Possible existence of liquids in an anticrystalline structural state. V.I.Psarev, A.L.Ivanov (I.N. Ul'yanov Chuvash State Univ., USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.706-10 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.31-5 (Aug. 1982). [received: April 1983]
The character of crystallization and transition into an amorphous state of alloys based on tellurium with the elements Ge, Si, Al, In, Ga indicates the existence of an interrelationship between the internal structure of the fused alloy and the crystalline structure which develops upon solidification. The observed crystalline effects considered together with the peculiarities of metastable phase formation in alloys of other systems indicates the insufficiency of present concepts of the cluster structure of liquids. A new description of the most probable structural state of a liquid will be formulated on the basis of experimental data. (11 refs.)

66808 Structure of molten Bi-Zn-alloys by means of neutron diffraction. W.Knoll, P.Lamparter, S.Steeb (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.395-8 (April 1983).
Neutron diffraction experiments were performed with five molten Bi-Zn-alloys and the two molten elements Bi and Zn. The total structure factors and the pair correlation functions are given. The concentration dependence of the experimental nearest neighbour distances and the experimental coordination numbers is in accordance with the segregation behaviour prevailing in these melts. 61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

66809 Temperature dependence of liquid crystal tilt angles. H.A.van Sprang, R.G.Aartsen (Philips Res. Labs., Eindhoven, Netherlands).
Appl. Phys. Lett. (USA), vol.42, no.8, p.669-71 (15 April 1983).
In a homogeneous cell the origin in the steep decrease, which is always observed in the liquid crystal tilt angle on an SiO_x coating as a function of temperature in the range close to T_c, is traced back to the growth of twist domains. It appears that a magnetic null method is unsuited for accurate tilt angle measurements in the relevant temperature region, because it is based on the assumption of a homogeneous director pattern in the sample cell. (13 refs.)

66810 Binary smectic mixtures in the infinite dilution limit. W.Wagner (Akad. der Wissenschaften, Zentralinst. fur Elektronenphys., Berlin, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.K35-7 (1983).
The authors extend the well-known McMillan theory of the smectic A phase to investigate binary mixtures. They also investigate the nematic-smectic A transition and investigate the possibility of phase separation. (6 refs.)

66811 Studies on induced smectic phases. III. Fourier transform infrared and laser-Raman spectral differences between isotropic and induced smectic phase of binary mixtures of nematogens with contrasting dielectric anisotropies. J.Szabon (Central Res. Inst. for Phys., Budapest, Hungary), W.Pilz, H.D.Koswig.
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.519-25 (1983).
The S_E, S_B, S_A induced phase sequence was detected in binary mixtures of two nematogens, 4,4′-di-n-heptyl azobenzene (7 AB) with 4-n-pentyl-4′-cyano biphenyl (5CB). The mixtures as well as the single components were studied by Fourier transform IR and laser-Raman spectroscopy at different temperatures. Charge redistribution of 5CB is demonstrated by the spectral differences found by the ratio-recorded IR spectra and also by integrating the intensities of some Raman lines. The spectra of the different phases of the 7AB-5CB mixture, built up from components of different length, indicate a population increase of the gauche conformers of 7AB in the smectic A phase. (9 refs.)

66812 Dielectric investigations in liquid crystalline substances with elongated lateral groups. H.Kresse, M.Keil, W.Weissflog (Sektion Chem., Martin-Luther-Univ., Halle-Wittenberg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.563-7 (1983).
By the aid of dielectric measurements (dipole moments, static dielectric constants, dielectric absorption) the influence of the chemical structure of a lateral group on the dielectric behaviour has been investigated. From the experimental data it can be deduced that the lateral group rotates independently. (7 refs.)

66813 The contrast gain in a guest-host nematic display due to a periodic boundary condition. G.Barbero (Dipartimento di Fisica, Univ. di Calabria, Calabria, Italy), A.Strigazzi.
Appl. Phys. A (Germany), vol.A31, no.1, p.55-7 (May 1983).
The mean square tilt angle of a nematic slab with finite anchoring energy and periodic boundary conditions has been theoretically investigated, as a

function of the slab geometry and of the reduced extrapolation length. If the anchoring strength is free-surface-like, the contrast is affected by a loss $\gtrsim 10\%$ at room temperature if the ratio between the anchoring pitch and the cell thickness is $\gtrsim 0.5$. (27 refs.)

66814 Surface twist disclination in nematics on ferroelectric TGS. L.Lejcek (Inst. of Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.447-4 (1983).
The core structure of twist disclination in MBBA above the domain wall in ferroelectric TGS with positive and negative polarization is investigated using the Peierls-Nabarro model. The lowest limit of the surface anchoring energies of negatively and positively polarized domains is estimated using the experimentally determined width of disclination. A similar estimate of the surface anchoring energy of paraelectric TGS is also made. (16 refs.)

66815 Landau-type theory applied to mixtures of liquid crystals of opposite diamagnetic anisotropies. K.P.Sinha, R.Subburam (Indian Inst. of Sci., Bangalore, India), C.L.Khetrapal.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.472-4 (15 April 1983).
An application of Landau-type theory to interpret the orientation of mixed liquid crystals of opposite diamagnetic anisotropies has been made. Experimental NMR results on three systems containing benzene and acetonitrile as the probe molecules have been interpreted. The computed order parameters are in agreement with those obtained experimentally in several systems. The switching transition at a critical concentration and temperature and the coexistence of two types of orientations have been explained. (5 refs.)

66816 Dielectric anisotropy in 4-nitrophenyl 4′-octyloxybenzoate. R.A.Yadav (Appl. Sci. Dept., M.M.M. Engng. Coll., Gorakhpur, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.999-1000 (Dec. 1982). [received: April 1983]
The temperature variation of the static dielectric constants ($\epsilon_\parallel$ and $\epsilon_\perp$) of 4-nitrophenyl 4′-octyloxybenzoate has been investigated in isotropic, nematic and smectic-A phases under the influence of sufficient magnetic field acting parallel and perpendicular to the symmetry axis of the molecule. Steps have been found in both $\epsilon_\parallel$ and $\epsilon_\perp$ as well as in the dielectric anisotropy (ϵ_a) at the nematic-smectic-A phase transition. This effect is interpreted as due to the increase of the number of pairs of antiparallel dipoles at the phase transition. (10 refs.)

66817 Thermal generation of confocal domains in a smectic A liquid crystal. N.J.Chou, S.W.Depp, J.M.Eldridge, M.H.Lee, G.J.Sprokel, A.Juliana, J.Brown (IBM Res. Lab., San Jose, CA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1827-32 (April 1983).
The effects of vacuum-deposited SiO_x alignment layers on the thermal generation of focal conic centers in a smectic A liquid crystal were investigated using controlled thermal cycles. Surface defects were found to promote focal conic formation. Focal conic density increases with cooling rate for a given alignment layer, and with the deposition angle of the alignment layer for a fixed cooling rate. An attempt was made to fit these findings to hetrogeneous nucleation theory in an effort to better understand the effects of selected thermodynamic properties on the focal conic formation process. (24 refs.)

66818 Smectic behavior and molecular structure: on the mesomorphism of a series of hydrocarbons. W.H.de Jeu (Solid State Phys. Lab., Groningen, Netherlands), R.Eidenschink.
J. Chem. Phys. (USA), vol.78, no.7, p.4637-40 (1 April 1983).
The polymorphism is discussed of a series of hydrocarbons that show, besides a smectic-A phase, a strong tendency towards the formation of smectic-B. The powder X-ray diffraction patterns show at large Bragg angles an unusual double reflection with a very small separation, which indicates a *3D* hexagonal closed packing. It is shown that, quite generally, nonpolar molecules form orthogonal smectic phases. The implications are discussed for the relationship between molecular structure and smectic behavior. (29 refs.)

66819 Proton Zeeman and dipolar relaxation study of the ferroelectric liquid crystal DOBAMBC. R.Y.Dong, J.Sandeman (Dept. of Phys. & Astron., Brandon Univ., Brandon, Manitoba, Canada).
J. Chem. Phys. (USA), vol.78, no.7, p.4649-53 (1 April 1983).
The proton Zeeman spin-lattice relaxation time T_1 and the proton dipolar spin-lattice relaxation time T_{1D} of a chiral compound *p*-decyloxybenzylidene *p′*-amino-2-methyl butyl cinnamate are studied as a function of temperature and sample rotation in a magnetic field at 30 MHz. In addition, proton T_1 is measured in the smectic *A*, ferroelectric smectic C^* and H^* phase at 15.1 and 45.5 MHz. The spin relaxation mechanism for the proton T_1 and T_{1D} in the smectic *A* and C^* phase are 'diffusion-induced' orientational order director fluctuations and molecular self-diffusion. In contrast with the achiral compound TBBA, the T_1 angular dependence in the smectic C^* and *C* phase are different, while the T_{1D} angular dependence appears to be similar in these smectic phases. (18 refs.)

66820 Critical thickness of a hybrid aligned nematic liquid crystal cell. G.Barbero, R.Barberi (Dept. of Phys., Calabria Univ., Rende, Italy).
J. Phys. (France), vol.44, no.5, p.609-16 (May 1983).
The authors discuss the director deformation inside a hybrid aligned nematic (HAN) cell, assuming that the surface interaction is of the $(w/2)\sin^2(\phi-\Phi)$ kind, and they suppose that the anchoring energy for homeotropic alignment is greater than the planar one. In the absence of an external electric field, they show that a critical thickness d_c, below which the nematic liquid crystal (NLC) is undistorted, exists. Furthermore they investigate theoretically d_c vs. the reduced electric field (E/E_c, where E_c is a threshold field depending upon the anchoring energies and the intrinsic constants of the NLC). The last analysis shows that there are two critical thicknesses $d_c^{(H)}$ and $d_c^{(P)}$: for $d<d_c^{(H)}$ the sample is homeotropic (HOM), while for $d>d_c^{(P)}$ it is planar (PLAN). Finally they point out that if the anchoring energies are the same on the upper and lower plates of the sample, the HAN-configuration is realizable only if $E/E_c<1$. (20 refs.)

66821 Two new mesophases in a chiral compound. A.M.Levelut, C.Germain, P.Keller, L.Liebert (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France), J.Billard.
J. Phys. (France), vol.44, no.5, p.623-9 (May 1983).
Microscopical, miscibility and X-ray studies establish the existence of two new mesophases in the two enantiometers of 1 (methyl)-heptyl terephthalidene bis amino cinnamate. In one of this two mesophases the two enantiometers do not exhibit a total miscibility range; while for the second the untwisted form observed with the racemic mixture has a higher temperature range of stability than the twisted form observed for the pure enantiometers. Information about the structures of the two phases is given and a comparison is made with the S_C* and S_D phases. Nevertheless the location of these two phases in the sequence of the presently known calamitic mesophases is not yet completely established. (17 refs.)

66822 Growth of cubic liquid single crystals in cholesteric blue phases. H.Onusseit, H.Stegemeyer (Dept. of Phys. Chem., Univ. Paderborn, Paderborn, Germany).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.409-11 (March 1983).
The growth of liquid single crystals of cholesteric 'Blue Phases' has been studied by polarizing microscopy. Using extremely small cooling rates, single crystals of quadratic shape have been obtained. This habit is interpreted as being due to a cubic symmetry of the molecular long axes orientation. Possible space groups are discussed. (15 refs.)

66823 Molecular field theory of nematics: density functional approach. I. Bulk effects. T.J.Sluckin (Faculty of Math. Studies, Univ. of Southampton, Southampton, England), P.Shukla.
J. Phys. A (GB), vol.16, no.7, p.1539-53 (11 May 1983).
The molecular field theory of nematics is rephrased in density functional language. The free energy in the nematic state is expressed as a functional expansion around the isotropic state in powers of the nematic order parameters $\bar{P}_l$ and the fractional density change η at the isotropic-nematic transition. The crucial quantities in the expansion are spherical harmonics of the direct correlation functions in the isotropic state. Sensible approximations to these direct correlation functions lead to other well known formulations of nematic field theory. An exact (in the authors' approximation) result for η is obtained in terms of the potential parameters U_l and the order parameters $\bar{P}_l$ at the phase transition. The authors discuss the relationship of their approach to other microscopic theories of nematics. The theory can be extended to discuss inhomogeneous systems. (32 refs.)

66824 An analysis of thermal instabilities in obliquely aligned layers of a nematic liquid crystal. P.J.Barratt, J.S.Bramley (Dept. of Math., Univ. of Strathclyde, Glasgow, Scotland).
J. Non-Equilibrium Thermodyn. (Germany), vol.7, no.6, p.371-88 (1982).
An analysis of continuum theory, this paper investigates the occurrence of stationary and oscillatory convective instabilities when a 'comparatively thick' horizontal layer of nematic liquid crystal is subjected to a vertical temperature gradient, the director being uniformly obliquely aligned at the boundaries. Two distinct types of roll instability are considered, one being independent of the direction in these planes. To obtain accurate numerical values for the threshold gradients, the authors use Chebyshev polynomial expansions. The variation of the critical temperature gradients for both types of instability with the field strength of a uniform magnetic field applied parallel to the initial alignment and with the boundary alignment itself is investigated. (24 refs.)

66825 Flexoelectric effect in MBBA in strong electric fields. V.A.Grigor'ev, Zh.Zhelkobaev, A.V.Kaznacheev, V.I.Kukhtevich, A.S.Sonin (All-Union Sci.-Res. Inst. of Optophys. Measurements, Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1801-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3174-6 (Oct. 1982). [received: April 1983]
It has been established that the application of a transverse electric field to a homeotropic layer of MBBA causes a flexoelectric strain, which gives rise to an optical path difference Δl induced by the field E, with $\Delta l \sim E^2$. The authors attempt to detect the quadratic electrooptic effect in the nematic phase of MBBA. For this they used the interferometric technique for measuring the phase characteristics of liquid crystals described by Akimov et al. (1978). (4 refs.)

66826 Features of the behavior of a ferroelectric liquid crystal in alternating fields. D.F.Aliev, M.A.Aslanov, M.V.Loseva, N.I.Chernova (S.M. Kirov State Univ., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1804-5 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3179-81 (Oct. 1982). [received: April 1983]
The authors establish how the threshold voltages for the electrooptic effects realized in ferroelectric liquid crystals depend on the number of the member of a homogeneous series and make a detailed study of the nature of the modulation of light by a multidomain texture of the sample. In the measurements they have used a sandwich cell with a thickness of the liquid-crystal layer of 20 μ. The object of study was the homologous series of the salicylideanilines, which have a ferroelectric phase S_c^* over a rather wide range of temperatures. (10 refs.)

66827 Topological point singularities in A-smectics. M.V.Kurik, O.D.Lavrentovich.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.452-5 (March 1983). In Russian.
The polarised microscopy method was used for an experimental investigation of textures in drops of A-type smectic liquid crystals for controlled boundary conditions (tangential and normal) and for various drop shapes. It is shown that in drops with normal boundary conditions it is possible for topological point defects with indexes q=1 and q=$^1/_2$ to exist. For tangential boundary conditions, point defects were not observed. (8 refs.) *V.G.P.*

66828 Investigation of structure relaxation in Co-Ni-Fe base metal glasses by X-ray scattering. Zhao Ji-liang, Luo Yuan-su, Huang Sheng-tao (Dept. of Phys., Wuhan Univ., Wuhan, China).
Acta Phys. Sin. (China), vol.32, no.1, p.15-24 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The effects of isothermal and isochronal annealing on the structures of the metal glasses $Co_{50.7}Ni_{19.5}Fe_{7.8}Si_6B_{16}$ and $Co_{42.9}Ni_{27.3}Fe_{7.8}Si_8B_{14}$ have been investigated by the wide angle and the small angle X-ray scattering methods. The experimental results obtained show two types of structure relaxation: The relaxation associated with topographical short range ordering (TSRO) and the relaxation associated with chemical short range ordering (CSRO), and give particularly the direct evidence of the CSRO relaxation process in the amorphous states. The atomic co-operative process of the two types of structure relaxation, and their coexistence and correlation are discussed preliminarily. (18 refs.)

66829 X-ray diffraction study of short-range order in a disordered Au_3Cu alloy. M.Bessiere, S.Lefebvre, Y.Calvayrac (CECM, Vitry-sur-Seine, France).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.145-53 (1 April 1983).
The X-ray diffuse scattering from an Au_3Cu single crystal rapidly cooled from 485K is quantitatively measured both at room temperature and at 80K. Different methods for correcting from temperature diffuse scattering are used: extrapolation to 0K, calculation of thermal diffuse scattering [Walker and Chipman (1970), Acta Cryst. A26, 447-55], data analysis with the Borie-Sparks method [Borie and Sparks (1971), Acta Cryst. A27, 198-201] and with the improvement proposed by Hayakawa, Bardhan and Cohen (J. Appl. Cryst. (1975), 8, 87-95]. As in earlier electron diffraction studies [Watanabe and Fischer (1965). J. Phys. Soc, Jpn, 20, 2170-9], a fourfold splitting of the diffuse intensity is observed at 100, 110 and equivalent positions in reciprocal space. A recalculated short-range-order intensity map shows that long-range two-site correlation functions are essential in order to fit the experimental data. (37 refs.)

66830 Local structure of δ-FeOOH. G.Patrat, F.de Bergevin, M.Pernet, J.C.Joubert (Lab. de Cristallographie, CNRS, Grenoble, France).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.165-70 (1 April 1983).
Short-range order between 50% vacancies (□) and 50% Fe on the Fe sites has been studied in the disordered compound iron hydrogenperoxide, δ-FeOOH, using powder X-ray diffuse scattering techniques. A preliminary treatment of the intensity was made in which the two Fe sites were considered as equivalent. Two conclusions were deduced: along the **c** axis. Fe cations can be nearest neighbours but their distance is 16% larger than the mean value obtained with the mean structure; along the **c** axis, the periodicity is Fe□Fe□... on the sites separated by 4.56 Å. In a more accurate treatment the two Fe sites have been considered separately. (6 refs.)

66831 Structure analysis of the disordered cubic phase of rubidium cyanide. K.-D.Ehrhardt, W.Press (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), G.Heger.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.171-5 (1 April 1983).
With neutron diffraction the orientational distribution of the CN^- group in the disordered cubic phase of RbCN is investigated at two different temperatures. The description of the orientational distribution functions includes a coupling between rotational and translational degrees of freedom. The influence of the thermal diffuse scattering is discussed. The results are compared with the findings in KCN and NaCN. (22 refs.)

66832 Conditions for the preparation and subsequent crystallization of amorphous alloys of the Ge-Te system. V.I.Psarev, A.L.Ivanov, T.Yu.Vtorkina, M.Yu.Fedorov (I.N. Ul'yanov Chuvash State Univ., Chuvash, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.789-92 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.942-5 (June 1982). [received: Feb. 1983]
The peculiarities of the formation and subsequent crystallization of amorphous tellurium-germanium alloys containing 3.5 to 30.5 at.% Ge were investigated. The fundamental possibility of obtaining amorphous states in the case of relatively slow and quiet cooling of superheated melts was shown in the case of these alloys. The minimum cooling rate should be applied to the melt with the eutectic composition. A change in the internal structure of the melts during their heating and cooling in the precrystallization range of temperatures that is accompanied by a reversible thermal effect at 390-400°C was observed. Crystallization of the post-eutectic, eutectic, and pre-eutectic amorphous alloys is a multistep process and has its own characteristic features in each case. The first step in the crystallization of post-eutectic amorphous alloys is characterized by the segregation of monoclinic tellurium, which is converged to hexagonal tellurium only in the subsequent steps of the transformations. In the crystallization of amorphous alloys with eutectic and pre-eutectic compositions hexagonal tellurium is formed immediately in the first step, after which the Te+GeTe eutectic is formed. (7 refs.)

66833 Structural features of amorphous and crystalline red phosphorus. V.V.Makarenko, N.D.Talanov, S.B.Kapilevich, L.M.Melikyants (Ya.V. Samoilov Sci.-Res. Inst. for Fertilizers, Insecticides & Fungicides, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.918-20 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1083-6 (July 1982). [received: Feb. 1983]
By means of electron microscopy, mercury porosimetry, and gas adsorption, the authors have investigated the structural features of amorphous and crystalline red phosphorus. Their specific surface areas and pore volumes have been determined. The amorphous red phosphorus has been shown to contain closed pores. As a consequence, the amorphous red phosphorus is comparatively resistant to oxidation by atmospheric oxygen, in comparison with the crystalline red phosphorus. (10 refs.)

66834 Bond length measurements in amorphous solids by nutation NMR spectroscopy: the role of RF field homogeneity. D.Horne, R.D.Kendrick, C.S.Yannoni (IBM Res. Lab., San Jose, CA, USA).
J. Magn. Resonance (USA), vol.52, no.2, p.299-304 (April 1983).
It is possible to measure internuclear distances in amorphous solids from homonuclear dipolar splittings obtained using nutation NMR spectroscopy. These splittings, manifest as the maxima in a Pake powder pattern are normally masked or distorted by chemical shift effects in the spectrum obtained from a free decay but emerge clearly in the Fourier transform of a transient nutation excited by the sudden and continuous application of a resonant RF field. The note underlines the importance of RF field homogeneity in nutation NMR experiments, and illustrates the improvement in resolution gained by using an RF coil designed to produce a more uniform RF field distribution. The spectra presented show that with this improvement, carbon-carbon bond lengths in amorphous solids can be measured with 1% accuracy. (10 refs.)

66835 Intrinsic limitations of diffraction methods for the study of noncrystalline structures. A.Guinier (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.1-5 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The diffraction methods determine completely the structure of crystals, because the matter is ordered. In the case of amorphous substances, the possibilities of diffraction have limitations that improved technics cannot overcome. In that case, hypothetic structural models may be very useful. (no refs.)

66836 New methods of studying disordered solids. J.D.Mackenzie, J.Lau (Dept. of Materials Sci. & Engng., Univ. of California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.7-16 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
In the past five years or so, many new methods have been used to elucidate the different aspects of the structure of disordered solids such as local structure, long-range structure, microstructure, and defect structure. Simultaneously, many new disordered solids have been prepared and hence the number of unsolved problems are in a sense undiminished. In addition, new tools have been utilized to gain understanding of some important properties of disordered solids. Despite the many new techniques and approaches, much remains uncertain both with respect to structure and to properties. The recent positive contributions of new methods are critically reviewed and some continuing challenges discussed. (64 refs.)

66837 The structure and the medium range order in thin amorphous germanium films prepared in UHV. P.Viscor (Univ. de l'Etat, Mons, Belgium).
J. Phys. Colloq. (France), vol.43, no.C-9, p.39-42 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Stable amorphous germanium (a-Ge) films were prepared by slow evaporation onto heated sapphire substrates in ultrahigh vacuum (UHV). The structure of these films was investigated by in-situ transmission high energy electron elastic diffraction performed at 77K, by in-situ density measurements and by in-situ determination of the low energy refractive index. The density and the refractive index measurements indicated that thin, stable a-Ge films are appreciably less dense than the crystaline counterpart. The low temperature electron diffraction experiments showed some changes in the positions of the reciprocal space interference maxima, when compared with work of others. Also for the first time, a 'sharp' diffraction pre-peak (at $s=1.2$ $Å^{-1}$) has been observed, a diffraction feature generally seen in disordered systems. The results are discussed in terms of the coordination and the range of the electronic bonding interactions in glass. (10 refs.)

66838 Structures of amorphous materials and specific volume variations versus the temperature. J.F.Sadoc, R.Mosseri (Phys. des Solides, Univ. Paul Sabatier, Orsay, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.97-100 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A systematic structural description of amorphous materials is presented and used, to explain the variation of the specific volume of amorphous (or glassy) compounds versus temperature. (14 refs.)

66839 Amorphization of silicon oxynitride irradiated with fast neutrons; study by infrared spectrometry. M.I.Baraton, P.Quintard (Lab. de Phys. Moleculaire, Limoges, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.127-30 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Reports measurements of the infrared absorption in fast neutron irradiated Si_2ON_2, correlated with the kinds of damage induced in the crystal cell. First the authors have assigned all observed absorption bands of the spectrum and obtained the integrated intensity for the fresh and irradiated material, then they have clearly shown a break in silicon-oxygen bond and variations in the nearest structures. These point defects precede a progressive amorphization of the bulk. (10 refs.)

66840 Crystallisation of noncrystalline solids in the system $Li_2B_2O_4$-$LiFe_5O_8$. C.Chaumont, J.C.Bernier (Dept. Sci. des Materiaux, CNRS, CENSCS, Strasbourg, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.215-18 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
In the system $Li_2B_2O_4$ (100-x)-$LiFe_5O_8$x (0,1<x<15%) amorphous compounds prepared by ultrafast quenching methods are metastable and crystallize by annealing. The crystallization scheme found for $Li_2B_2O_4$90-$LiFe_5O_8$10 is extended to all the system. Anomalies observed for the glass temperatures T_G are interpreted with the diagram Volume/Temperature/State of the system. They are due to the discrepancies in respect to perfect glass and can be studied by differential scanning calorimetry (DSC or DTA). (6 refs.)

66841 Defects in Fe_7C_3 type carbide formed during the crystallisation of amorphous high carbon alloys and their relation with the amorphous state. E.Bauer-Grosse, J.P.Morniroli, C.Frantz, G.Le Caer (Lab. de Metallurgie, Ecole Nat. Superieure de la Metall., Industrie des Mines, Nancy, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.285-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
M_7C_3 type carbides have an orthorhombic structure, as proposed by R. Fruchart et al. (1970). This structure may be hidden by defects which are typical of the preparation method. In Fe_7C_3 formed by crystallization of sputter-deposited amorphous $Fe_{75}C_{25}$ alloys, the defects are only consistent with elongated domains whose size is less than ~100 Å, the order of the defect size. In primary M_7C_3 carbides, present in white cast-iron and chromium steels, domains are about 100 times larger than in the latter case. Both results suggest that domain growth is impeded during the crystallization of amorphous $Fe_{75}C_{25}$. Nuclei may thus already exist in or be easily deformed with a large density from the amorphous state. The formation of Fe_7C_3 is discussed within the frame of the Gaskell model (1979). (12 refs.)

66842 Bond ordering in noncrystalline solids. A.G.Revesz (COMSAT Labs., Clarksburg, MD, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.307-10 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
From the analysis of optical properties of noncrystalline (NC) and the corresponding crystalline solids with predominantly covalent bonds a bonding order parameter, F, is derived. This parameter reveals differences between NC solids which are characterized by similar degree of short-range-orders as, e.g., amorphous Si ($F \leq 0.8$) and vitreous SiO_2 ($F \simeq 1$). Both the optical and electrical properties indicate that, in contrast to amorphous solids, the electronic states in vitreous solids may remain delocalized even though there is no long-range-order. (21 refs.)

66843 Neutron diffraction study of amorphous binary alloys. T.Mizoguchi, N.Nishioka, S.Yamada, T.Suemasa, S.Yoda, N.Akutsu, H.Narumi, T.Kudo, M.Akimitsu (Faculty of Sci., Gakushuin Univ., Tokyo, Japan), N.Watanabe, M.Nishi, K.Motoya.
J. Phys. Colloq. (France), vol.43, no.C-9, p.659-70 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
For structural investigation of amorphous alloys TOF neutron diffraction experiments were carried out with the pulse neutron source at the National Laboratory for High Energy Physics in Japan. Results on Zr base 3d transition metal binary amorphous alloys especially Ni_xZr_{1-x} of wide composition range ($0.18 \leq X \leq 0.90$) are reported. Isotope substituted $Ni_{36}Zr_{.64}$ alloys were measured to get the partial structures. There seems to exist a chemical short range order in this amorphous alloy, resulting in a sharp Zr-Ni pair correlation and poor Ni-Ni nearest neighbor correlation. For ferromagnetic Fe-B amorphous alloys polarized neutron diffraction gives information about the partial structures. (10 refs.)

66844 Spatial charge fluctuations in amorphous silicon. J.Reichardt, R.L.Johnson, L.Ley (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.877-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
High resolution Si 2p core level spectra reveal a broadening for amorphous silicon (a-Si) compared to Cs-Si. This is due to static fluctuations in valence charges brought about by bond length and bond angle variations in the amorphous network. The observed Gaussian broadening of 256 meV corresponds to RMS deviation from charge neutrality of approximately 0.11 elementary charges. The addition of hydrogen reduces the charge fluctuations in proportion to the number of hydrogen atoms attached to a given silicon atom. The chemical shift induced by each hydrogen atoms is 0.34 eV which corresponds to a charge transfer of 0.15 electrons from silicon to hydrogen. (5 refs.)

66845 Structural order and optical properties of tetrahedral amorphous solids. N.Maley, L.J.Pilione, S.T.Kshirsagar, J.S.Lannin (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.880-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Raman scattering and optical absorption measurements indicate substantial changes in a-Si deposited under conditions of variable substrate temperature. The results indicate an approximately linear variation of the optical gap with the inverse width of the transverse optic-like band. This correspondence is also observed in preliminary studies of a-Ge for the depolarized Raman component. The variation of the depolarized spectra with deposition conditions is attributed to small modifications of short range order in both a-Si and a-Ge which alter the TO-like phonon half width. The correlation between changes in the Raman spectra and optical gap indicate that variations in both the phonon and electronic states in tetrahedrally coordinated amorphous solids are primarily due to modifications of the bond angle distribution. (11 refs.)

66846 Boron and hydrogen bonding in B-doped a-Si:H—an NMR study. S.G.Greenbaum, W.E.Carlos, P.C.Taylor (Naval Res. Lab., Washington, DC, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.886-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
^{11}B and ^{1}H NMR measurements performed on boron-doped films of a-Si:H prepared by glow discharge are reported. A sample containing 10 atomic % B exhibits two distinct boron sites, both of them being threefold coordinated. A second sample containing 0.7 atomic % B shows only one boron site, also threefold coordinated. Measurements of the ^{11}B spin-spin relaxation time T_2 indicate the boron sites are clustered in both the 10% B and 0.7% B materials. The temperature dependence of the ^{1}H spin-lattice relaxation time T_1 in the 10% B film does not exhibit the sharp T_1 minimum commonly observed in undoped a-Si:H films prepared by glow discharge. Suppression of the T_1 minimum in the B-containing material is explained in terms of a spin diffusion bottleneck in the relaxation pathway of the Si- or B-bonded protons in the film. (11 refs.)

66847 Small angle neutron scattering study of structural heterogeneities in a-Si:H. R.Bellissent (LLB, CENS, Gif-sur-Yvette, France), A.Chenevas-Paule, M.Roth.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.941-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Small angle neutron scattering measurements have been made on pure, hydrogenated or deuterated samples of amorphous silicon. The scattered intensity from the sputtered films indicate density fluctuations of average radius of gyration of about 125 Å. The presence of a ring at 0.22 $Å^{-1}$ on the diffraction pattern obtained from a-Si:H suggests a possible correlation length of about 30 Å. (12 refs.)

66848 Order and disorder in two-dimensional random networks. C.J.Lambert (Dept. of Phys. & Astron., Michigan State Univ., East Lansing, MI, USA), D.Weaire.
Philos. Mag. B (GB), vol.47, no.4, p.445-50 (April 1983).
The statistical properties common to a range of two-dimensional random networks are considered. In particular, Aboav's empirical relation for the average number of sides m_n on the neighbours of n-sided cells are examined. Attention is focussed not on the widely differing physical properties of these networks, but on the common topological properties as summarized by a general sum rule. An expression is obtained for the parameter **a** in Aboav's relation and in the case where skewness in the distributions can be ignored, **a** is shown to be simply related to the coefficient of kurtosis of the distribution function for n-sided cells. (8 refs.)

66849 Doping of amorphous silicon by implantation of manganese ions. A.V.Dvurechenskii, I.A.Ryazantsev, V.A.Dravin (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1271-3 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1969-73 (Nov. 1982). [received: April 1983]
Electrical and ESR measurements were used to study films of amorphous silicon (*a*-Si) deposited by evaporation and irradiated with Mn^+ ions in doses of 2×10^{15}-8×10^{16} cm^{-2}. It was established that the conductivity σ of *a*-Si:Mn films increased on increase in the dose Φ of the implanted dopant, the highest value reached being 0.3 $\Omega^{-1}.cm^{-1}$. The ESR signal due to intrinsic localized states (*VV* centers) increased on increase in the dose earlier in the case of *a*-Si:Mn than for samples of *a*-Si implanted with group II and V impurities. The temperature dependence of the conductivity of *a*-Si:Mn films recorded in the range 300-500K ($\Phi = 10^{16}$ cm^{-2}) had a linear region with an activation energy of 0.15 eV, which was attributed to the appearance of the manganese acceptor states in the pseudogap. The thermal stability of the conductivity of *a*-Si:Mn films increased on increase in the implanted impurity dose. The observed high doping efficiency and saturation of dangling bonds on introduction of Mn^+ into *a*-type Si was explained by a model of a complex containing the pentavalent impurity and a defect with a dangling bond of a silicon atom. It is suggested that such a complex is an acceptor. (11 refs.)

66850 Ag photodoping of amorphous chalcogenides. S.A.Lis, J.M.Lavine (GCA Corp., Bedford, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.675-7 (15 April 1983).
Spectral measurements over the wavelength range of 400-800 nm on As_2S_3, As_2Se_3, and $GeSe_2$, measurements on a tuned structure of As_2S_3, and exact calculations on a multifilm structure support the recent suggestion that the photons relevant to the photodissolution of Ag are absorbed in the Ag and not in the chalcogenide. The observed spectral dependence may be fitted by an internal photoemission model. (5 refs.)

66851 Effect of low-temperature annealing on the structure of $Cu_{57}Zr_{43}$ glass. H.S.Chen, K.T.Aust, Y.Waseda (Bell Labs., Murray Hill, NJ, USA).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.153-7 (April 1983).
The authors present the results of new X-ray measurements on structural changes which occur in the $Cu_{57}Zr_{43}$ glass due to low-temperature annealing and also a comparison of the experimental data with the recent molecular dynamics simulation (S. Kobayashi and S. Takeuchi, 1982). (17 refs.)

66852 Effect of composition of glass ceramics of the system K_2O-SrO-BaO-Al_2O_3-SiO_2 on their structure and heat resistance. I.D.Tykachinskii, E.M.Konoval, G.V.Kataeva, T.P.Buyanova.
Inorg. Mater. (USA), vol.18, no.5, p.714-17 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.851-5 (May 1982). [received: Feb. 1983]
The structure of glass ceramics synthesized from strontium anorthite in combination with celsian depends essentially on the theoretically envisaged amount of potassium aluminosilicate glass phase (composition of leucite). The heat resistance of these materials depends not only on the amount of the glass phase, but much also on the structure formed in them. For instance, practically no reduction in heat resistance of the materials occurs upon addition of 10% glass phase and increase of the latter to 20% perhaps because of presence in the materials of a felted structure that creates a rigid framework capable of withstanding stresses at high temperatures (up to 1770K). With increase of the amount of the glass phase to 30% the structure of the material acquires a mosaic nature with fairly large speckled sites of glass phase that facilitate deformation under stress at high temperatures, which lower its heat resistance. (4 refs.)

66853 Amorphous to crystalline transformation of $Fe_{81}B_{13.5}Si_{3.5}C_2$. B.Bhanu Prasad, A.K.Bhatnagar (School of Phys., Univ. of Hyderabad, Hyderabad, India), R.Jagannathan.
J. Appl. Phys. (USA), vol.54, no.4, p.2019-24 (April 1983).
The crystallization of $Fe_{81}B_{13.5}Si_{3.5}C_2$ (Metglas 2605SC) has been studied by resistivity, differential thermal analysis (DTA), Mossbauer and X-ray techniques, and compared with reported results based on other techniques. The DTA shows in addition to the usual two peaks a third peak at 850K paralleled by a change in the resistivity measurements at the same temperature. The crystallization is found to take place gradually in the temperature region 750-810K with α-iron precipitating first. Mossbauer studies provides evidence for α-Fe, Fe_2B, and a species with a hyperfine magnetic field ~314 kOe which could not be unequivocally established. X-ray data shows evidence for the presence of Fe_3C in addition to α-Fe and Fe_2B. (28 refs.)

66854 Molecular dynamics study of triplet correlations in a rapidly quenched metal. I. Distribution of equilateral triplets. M.Tanaka (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1270-7 (April 1983).

Short-range order of atoms in rapidly quenched states of a simple liquid metal simulated by the molecular dynamics method is investigated in detail by computing the triplet distribution function $g^{(3)}(r_{12}, r_{23}, r_{31})$. Splitting of the second peak of $g(r)$ is shown to reflect strong equilateral triplet correlations at low temperatures in the second-neighbour shell around an arbitrary atom. A glass structure of the quenched state examined with $g^{(3)}(r, r, r)$ is understood as a distorted and imperfect *f.c.c.* packing: the nearest shell around an arbitrary atom consists of the *f.c.c.* nearest-neighbours, occupancy of the second nearest-neighbour sites is suppressed very much, and the subpeaks in the second-neighbour shell correspond to the third- and the fourth-nearest neighbours. Correlations beyond the second-neighbour shell are more diffuse and similar to a liquid structure. (15 refs.)

66855 Atomic-scale structure of amorphous (Ni-Co)-(Zr-Hf) alloys. D.Lee (Korea Univ., Seoul, Korea), A.Lee, C.N.J.Wagner, L.E.Tanner, A.K.Soper.

J. Phys. Colloq. (France), vol.43, no.C-9, p.19-22 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The structures of amorphous $Ni_{35}Zr_{65}$ and (Ni-Co)-(Zr-Hf) alloys have been determined employing the variable 2θ angle X-ray method and the variable wavelength neutron technique. The partial interference functions (structure factors) $I_{ij}(K)$ have been evaluated using the isomorphous substitution method. (7 refs.)

66856 Determination by polarized neutron diffraction of the three partial structure factors of a $Co_{81.5}{}^{11}B_{18.5}$ glass. J.M.Dubois (Lab. de Metall., ENSMIM, Nancy, France), P.Chieux, G.Le Caer, J.Schweitzer, J.Bletry.

J. Phys. Colloq. (France), vol.43, no.C-9, p.23-9 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The three partial structure factors (PSF) of a $Co_{81.5}{}^{11}B_{18.5}$ glass were simultaneously measured by polarized neutron diffraction. A prepeak appears around $Q=2$ Å^{-1} on the nuclear structure factor. The concentration-concentration PSF shows that the boron atoms are only surrounded by cobalt atoms. The following pair distances are deduced from PSF: R(Co-Co)=2.54 Å, R(Co-B)=2.3 Å, R(B-B)~3.6 Å. Finally the PSF calculated for the model of Gaskell (1979) are in satisfactory agreement with the measurements while a slight discrepancy is observed between experiment and the S_{CC} FSP calculated for a packing of sticky spheres. (21 refs.)

66857 Neutron diffraction studies of rare earth ions in glasses. A.C.Wright, G.Etherington, J.A.Erwin Desa, R.N.Sinclair (J.J. Thomson Phys. Lab., Reading, England).

J. Phys. Colloq. (France), vol.43, no.C-9, p.31-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The environment of the rare earth ions in vitreous Sm_2O_3-$Al_2O_3GeO_2$ has been studied using the neutron diffraction anomalous dispersion technique and that in vitreous NaF-DyF_3-BeF_2 by isotopic substitution. The mean Sm-O and Dy-F distances are 2.420 and 2.301 Å respectively. (8 refs.)

66858 Scattering studies of photo-structural changes in chalcogenide glasses. S.R.Elliott, T.Rayment, S.Cummings (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England).

J. Phys. Colloq. (France), vol.43, no.C-9, p.35-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Reports the first neutron scattering studies of the reversible photostructural changes in two chalcogenide glasses, As_2Se_3 and As_2S_3. The optically-induced changes extend to large values of Q, and are therefore caused by changes in the short-range order of the glass. The differences in the RDFs between illuminated and annealed samples show marked changes in the neighbourhood of the second-neighbour separation. The only model which fits the data is that of a photo-induced increase in bond-angle fluctuations by ~1°. (8 refs.)

66859 Determination of the local structure of metallic glasses by EXAFS. A.Sadoc, A.M.Flank, D.Raoux, P.Lagarde (LURE, Univ. Paris-Sud, Orsay, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.43-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The local structure of $Cu_{60}Zr_{40}$ and $Cu_{46}Zr_{54}$ amorphous alloys has been investigated by EXAFS. Moreover the effect of a structural relaxation has been studied in $Cu_{46}Zr_{54}$. (7 refs.)

66860 Local structures about some transition elements in oxide glasses using X-ray absorption spectroscopy. J.Petiau, G.Calas (Lab. de Mineralogie-Cristallographie, Univ. Paris VI et VII, Paris, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.47-50 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Absorption X-ray spectroscopy is used to study the local structure around transition elements (Cr-Fe-Co-Ni) in silicate and borate glasses. The complementarity of EXAFS, giving the neighbour distances, and of the near edge structure giving information about symmetry and chemical state is emphasized. (6 refs.)

66861 Chemical shifts of SiKα and AlKα in oxide glasses. T.Yanagase, K.Morinaga, S.Sumita (Dept. of Materials Sci. & Technol., Graduate School of Engng. Sci., Kyushu Univ., Fukuoka, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.51-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Chemical shifts of SiKα and AlKα in oxide glasses have been measured to find out the structure of SiO_2-complex anion and the oxygen co-ordination number of Al^{3+} by using high resolution X-ray fluorescence spectrometer (double crystal type). Optical basicity of these glasses proposed by Duffy and Ingram (1971) has been measured to discuss the chemical shifts of SiKα and AlKα. The relation between SiKα chemical shifts and the type of SiO_2-complex anions was derived by comparing with those standard samples. The distribution of SiO_2-complex anions was also determined by calculation with computer analysis. The results indicate that the chemical shift of SiKα has a linear relationship with the optical basicity of corresponding glasses. The structure and distribution of SiO_2-complex anions are discussed in terms of basicity of glasses. The chemical shift of AlKα has also a relationship with the optical basicity, which will lead to the discussion about the change of oxygen co-ordination number of Al^{3+} oxide glasses in terms of the basicity of glass. (13 refs.)

66862 Metallic glasses—some current issues. R.W.Cahn (Lab. de Metall. Phys., Univ. de Paris-Sud, Orsay, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.55-66 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Four aspects of the behaviour of metallic glasses are analysed in the light of recent results and theories: glass-forming ability of different alloys; structure and short-range order; the nature of free volume; thermal relaxation, reversible or irreversible. The concept of chemical short-range order runs as a common thread through these various issues, and some space is devoted to a historical resume of the study of SRO in crystalline solid solutions, in order to draw some instructive parallels. The special importance of establishing how SRO in glasses varies as a function of temperature is emphasised. (75 refs.)

66863 Structural description of transition metal-metalloid glasses. J.M.Dubois, G.Le Caer (Lab. de Metall., ENSMIM, Nancy, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.67-74 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

A structural description of transition metal-metalloid glasses is proposed. It is based on the structural operations which allow generating the crystalline counterparts. A demixion at a microscopic level is naturally introduced whose consequences on the structure are discussed. Experimental arguments in favour of such a description are given which should provide a basis for the prevision of some properties of metallic glasses. (38 refs.)

66864 Clusters and local chemical order in amorphous metal-metalloid alloys. F.Machizaud, F.A.Kuhnast, G.Mbemba, J.Flechon (Univ. de Nancy I, Vandoeuvre les Nancy, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.75-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Referring to the amorphous metal-metalloid alloys obtained by oxido reduction in the liquid phase and studied by X-ray diffraction, the authors state precisely in what manner they determine the amorphous structure through a detailed analysis: the mean local order is described by geometrical clusters situated in a disordered matrix. (8 refs.)

66865 X-ray scattering study of correlated fluctuations in metallic glasses. A.Naudon, A.M.Flank.

J. Phys. Colloq. (France), vol.43, no.C-9, p.79-82 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

An X-ray scattering study is carried out with a specific camera which records the intensities from the small-angle region to the first diffraction halo of an amorphous material. Cu-Ti metallic glasses prepared either by sputtering or by liquid-quenching are compared. In the former case, spatial correlated fluctuations take place in the amorphous alloy before crystallization. The results also show that the pre-peak which is revealed by X-rays must be attributed to the size effect. (10 refs.)

66866 Effect of isothermal annealing on the structure of an amorphous Pd-Si alloy. M.Laridjani (Lab. de Magnetisme, CNRS, Meudon Bellevue, France), J.F.Sadoc.

J. Phys. Colloq. (France), vol.43, no.C-9, p.83-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The effect of heating on the structure of amorphous Pd-Si alloys is presented. Quasi-reversible effects are observed prior to structural relaxation. (4 refs.)

66867 Covalent and ionic metallic glasses. J.Bletry (Saint-Gobain Recherche, Aubervilliers, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.87-90 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Shows the possibilities and the limits of models of adhesive spheres to describe the structure of covalent or ionic metallic glasses. (5 refs.)

66868 Recent results on the ideal structure of glasses. N.Rivier (Blackett Lab., Imperial Coll., London, England).

J. Phys. Colloq. (France), vol.43, no.C-9, p.91-5 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The ideal random structure is defined as the most probable distribution of cell shapes, subject to topological and space-filling constraints. This implies a linear relation between average volume of f-sided cells, and f. This has been observed in 2D tissues (Lewis's law). The average $\langle f\rangle$ is calculated. From $\langle f\rangle=13.40$ in undifferentiated tissues, it increases with anisotropy of the cells, and decreases if their sizes fluctuate. (12 refs.)

66869 A structural interpretation of the density of alkali silicate glasses. P.H.Gaskell (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. Colloq. (France), vol.43, no.C-9, p.101-5 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Huggins's empirical formula giving the volume V_o per atom of oxygen is discussed in terms of structural concepts. (4 refs.)

66870 SAXS and TEM studies of phase separation in BaO-SiO_2 glasses. E.D.Zanotto, A.F.Craievich, P.F.James (Dept. of Ceramics, Glasses & Polymers, Sheffield Univ., Sheffield, England).

J. Phys. Colloq. (France), vol.43, no.C-9, p.107-10 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Amorphous phase separation was studied in the nucleation and growth region of the BaO-SiO_2 miscibility gap. Nearly spherical droplets were precipitated, the diameters obtained from SAXS and TEM being in reasonable agreement. The growth kinetics of the droplets were well described by the classical theory of coarsening. From the integrated SAXS intensities, the times to reach the equilibrium matrix compositions at 743 and 760°C were determined, and the binodal boundary located. Nucleation occurred during quenching from the melt or within a very short time of heat treatment. Coarsening began well before the attainment of the equilibrium matrix composition. (15 refs.)

66871 Short range structure and some physical properties of the glasses in the system Na_2O-Ga_2O_3-SiO_2. S.Goto, T.Hanada, R.Ota, N.Soga, N.Iwamoto, N.Umesaki (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.111-14 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The glass-forming region in the system Na_2O-Ga_2O_3-SiO_2 was determined, and the density, hardness and thermal expansion coefficient were measured. The glass-forming region in this system was found to be much wider than that in the Na_2O-Al_2O_3-SiO_2 system. The properties showed a sudden change at the composition of Ga/Na ratio=1. This anomaly is similar to that observed in the Na_2O-Al_2O_3-SiO_2 system. The results of IR spectra, X-ray emission spectra and X-ray diffraction patterns suggest that the non-bridging oxygens existing in sodium silicate glasses change into bridging oxygens with the addition of Ga_2O_3 at Ga/Na ratio less than 1 and then appear again along with the formation of Ga-O-Ga bonds with further addition of Ga_2O_3 over the Ga/Na ratio of 1. (9 refs.)

66872 Characterization and structure of intergranular vitreous phases in ceramics. J.Y.Laval, K.H.Westmacott, M.C.Amamra (Lab. d'Etude et de Synthese des Microstructures, CNRS-ESPCI, Paris, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.123-6 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The characterization techniques in electron microscopy for intergranular glassy phases in ceramics are reviewed and compared. The structure of the glassy phases was investigated in great detail, through electron induced processes. The time, voltage, beam current and temperature dependence of the growth rate of defects is consistent with an ionization damage process. From the interpretation of this process, a structural model was developed which has been confirmed by EXAFS spectroscopy and which postulates the presence of $M-O^-$ (M=glass-forming cation) dangling bonds and the influence of the valence state of the network-modifying cation. (9 refs.)

66873 The influence of melting condition on the radiation sensitivity of GeO_2 glass. R.A.Weeks, D.L.Kinser, G.Kordas, R.Magruder, M.Wells (Vanderbilt Univ., Nashville, TN, USA).

J. Phys. Colloq. (France), vol.43, no.C-9, p.149-53 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Effects of the fusion temperature and cooling rate on the concentration of the E_1 centers in GeO_2 glass are studied using EPR and optical methods. (5 refs.)

66874 Kinetics of glass formation and devitrification behavior. D.R.Uhlmann (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).

J. Phys. Colloq. (France), vol.43, no.C-9, p.175-90 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The process of glass formation is viewed from a kinetic perspective. Initial attention is directed to the kinetics of nucleation, both homogeneous and heterogeneous, and of crystal growth. Information obtained in these areas is combined with treatments of crystallization during continuous cooling to evaluate the critical cooling rates required to form glasses of various materials. Consideration is given to the material parameters which are conducive to glass formation, and to the process of crystallization on reheating of glass. The kinetic treatment is also used to describe other phenomena such as the effects of nucleating heterogeneities on glass formation and the use of DTA experiments to evaluate the barriers to crystal nucleation. (46 refs.)

66875 Formation, properties and structure of fluoroborate glasses. Cheng Ji-jian, Chen Zu-xiong (Dept. of Materials Sci. & Engng., East China Inst. of Chem. Technol., Shanghai, China).

J. Phys. Colloq. (France), vol.43, no.C-9, p.219-22 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

6 regions of glass formation of the ternary systems: $Li_2O-LiF-B_2O_3$, $Na_2O-NaF-B_2O_3$, $K_2O-KF-B_2O_3$, $CaO-CaF_2-B_2O_3$, $SrO-SrF_2-B_2O_3$, and $BaO-BaF_2-B_2O_3$ are determined. The composition dependence of some physical properties of fluoroborate glasses is investigated. The results of IR and UV spectra, DTA and X-ray diffraction studies give reliable data concerning the replacement of O^{2-} by F^- in glass network. The formation of some oxyfluorogroups is proposed. The change of coordination number of boron atoms from 3 to 4 in different borate and fluoroborate glasses is discussed. A structure model of calcium fluoroborate glass is schematically represented. (3 refs.)

66876 Structural study of aluminium fluoroberyllate glasses. J.J.Videau, J.Portier, B.Piriou (Lab. de Chimie du Solide, CNRS, Talence, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.223-9 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Aluminium fluoroberyllate glasses (AFB) obtained in the vitreous state from the quaternary system $BaF_2-CaF_2-AlF_3-BeF_2$ have been studied by EPR, FLN and by Raman spectroscopy. In these glasses, three types of network forming groups are present: (AlF_6), (AlF_4) and (BeF_4). $(AlF_5)_n$ chains are cross-linked with (AlF_4) in small amount and with (BeF_4) tetrahedra. These fluoroberyllate tetrahedra are present as a more or less polymerised species $(Be_nF_{3n+1})(n+1)^-$. These ABF glasses must be distinguished from those rich in BeF_4 groups. The network of fluoroberyllate glasses is constituted of corner linked (BeF_4) tetrahedra. (14 refs.)

66877 An investigation of relationship between phase separation and crystallization of $ZnO-Al_2O_3-SiO_2$ glasses. Li Jiazhi, Shang Ying, Hu Guanging (Shanghai Inst. of Ceramics, Acad. Sinica, China).

J. Phys. Colloq. (France), vol.43, no.C-9, p.231-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

TEM, DTA, X-ray diffraction results reveal that there is a strong tendency to phase separation into two immiscible liquid phases in the $ZnO-Al_2O_3-SiO_2$ (ZAS) glasses. β-quartz solid solutions would precipitate as metastable initial crystalline phase, when the degree of phase separation of the original glass is low, whereas β-quartz solid solution and β-Willemite solid solution would both be precipitate when the degree of phase separation is more complete. It was found that degree of phase separation not only determines the initial crystalline phase, but also accelerates the crystallization of the ZAS glasses. (5 refs.)

66878 Structure and properties of TiO_2-SiO_2 and TiO_2-GeO_2 glasses. S.Sakka, K.Kamiya (Mie Univ., Mie-Ken, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.235-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The coordination of Ti^{4+} ions in the low expansion TiO_2-SiO_2 glasses made from metal alkoxides by the sol-gel technique and TiO_2-GeO_2 glasses made by melting was investigated on the basis of the observation of crystallization behaviour and the infrared spectroscopy. The α-cristobalite type SiO_2 and α-quartz type GeO_2 crystals containing 4-fold coordinated Ti^{4+} ions precipitated in the TiO_2-SiO_2 and TiO_2-GeO_2 glasses. Infrared spectra of the glasses were very similar to the corresponding crystallized products. These facts suggest that the Ti^{4+} ions in the TiO_2-SiO_2 glasses are 4-fold coordinated with oxygens as in the glasses made by the high temperature flame spray technique, and that Ti^{4+} ions in the TiO_2-GeO_2 glasses are also in 4-fold coordination. (8 refs.)

66879 Glass-forming tendency of Pb-containing multicomponent chloride and bromide melts. M.Yamane, S.Inoue, A.Nakamura (Tokyo Inst. of Technol., Tokyo, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.239-42 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The glass-forming tendency of Pb-containing multi-component chloride and bromide melts has been investigated. The experiment was extended from binary eutectic compositions containing $PbCl_2$ to ternary and quaternary systems containing the components which gave the good glass-forming tendency in the first test. The melt of $PbCl_2-AgCl-CsCl-CdCl_2$ system showed the highest-glass forming tendency among chloride systems studied. The melt of $PbBr_2-AgBr-CsBr-CdBr_2$ system had higher glass-forming tendency than chloride containing the same cations. The correlation between glass-forming tendency and melting temperature was discussed. (8 refs.)

66880 Effect of hafnium selenide (HfSe) on the crystallisation of the IR transparent chalcogenide glass $Ag_{10}Ge_{30}Se_{60}$. D.Hemeda, G.Tilloca (Lab. de Sci. des Materiaux, Univ. de Montepellier II, Montpellier, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.243-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

A study of the $xHfSe-(100-x)As_{0.1}Ge_{0.3}Se_{0.6}$ system ($0,1 \leq x$ mole $\% \leq 4$) was undertaken with the aim of transforming chalcogenide glass $As_{10}Ge_{30}Se_{60}$ into a vitroceramic maintaining good infra-red transmission in the 7-12 μm domain. The samples were prepared by fusion into vacuo of various components in fixed portions sealed into silica ampoules. Crystallization of glasses after heat treatment of 400-420°C was observed by scanning electron microscopy and X-ray diffraction. The influence on infra-red transmission and thermomechanical properties of vitroceramics is analysed. (7 refs.)

66881 The structure and properties of phosphate glasses with transition metals elements. J.Wasylak, J.Koprowaski, E.Czerwosz (Dept. of Glass, Univ. of Mining & Metall., Krakow, Poland).

J. Phys. Colloq. (France), vol.43, no.C-9, p.247-51 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Conditions of melting glasses of the $Ba(PO_3)_2-Y_2O_3(MoO_3)-TiO_2(Fe_2O_3)$ system and some of the properties of information on the structure of the glasses. In the glass matrix of the $Ba(PO_3)_2-Y_2O_3$ system were found structural metaphosphate and orthophosphate groups and crystal fragments. Electric properties: specific resistance (ρ_y), loss angle (tgδx) and permittivity (ε_r) indicated, the dielectric character for the glasses with Y_2O_3 and a highly semiconducting character for those with a greater context of Fe_2O_3. (3 refs.)

66882 Crystallization behaviour of gels and gel-monoliths in the $Na_2O-B_2O_3-SiO_2$ system. S.P.Mukherjee (Batelle's Columbus Labs., Columbus, OH, USA).

J. Phys. Colloq. (France), vol.43, no.C-9, p.265-9 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Gels and gel-monoliths in the sodium borosilicate system were prepared by the hydrolytic polycondensation of alkoxysilane with trimethyl borate or boric acid and a suitable sodium compound. Three different procedures using three different sources of Na_2O were developed. Crystallinity of different gel-powders and gel-monoliths of two compositions were examined after thermal treatment at different temperatures above the glass transition temperature (T_g). Results indicate that the stability of the gels towards crystallization during gel-to-'glass' transformation around T_g depends on the composition, previous thermal history and time and temperature of heat treatment. The results are explained in terms of gel structures and the nature and role of sodium ions in gel structures. (18 refs.)

66883 Microstructure vs. molecular structure of silica glasses from silicon alkoxide. G.J.Garvey, L.C.Klein (Ceramics Dept., Rutgers State Univ. of New Jersey, Piscataway, NJ, USA).

J. Phys. Colloq. (France), vol.43, no.C-9, p.271-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Using simple physical measurements, a picture was constructed of the microstructure of a dried monolithic silica gel prepared from tetraethyl orthosilicate (TEOS). The density and dimensions were measured. Weight loss was monitored during heating of the gel to a fully dense glass, and gases escaping during heating were analyzed. The results were interpreted for the dried gel and compared to published studies of its molecular structure. (14 refs.)

66884 Investigations of glass structure using fluorescence line narrowing and molecular dynamics simulations. M.J.Weber, S.A.Brawer (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

J. Phys. Colloq. (France), vol.43, no.C-9, p.291-301 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The local structure at individual ion sites in simple and multicomponent glasses is simulated using methods of molecular dynamics. Computer simulations of fluoroberyllate glasses predict a range of ion separations and coordination numbers that increases with increasing complexity of the glass composition. This occurs at both glass forming and glass modifying cation sites. Laser-induced fluorescence line-narrowing techniques provide a unique probe of the local environments of selected subsets of ions and are used to measure site to site variations in the electronic energy levels and transition probabilities of rare earth ions. These and additional results from EXAFS, neutron and X-ray diffraction, and NMR experiments are compared with simulated glass structures. (25 refs.)

66885 Effect of light on structural relaxation in vitreous selenium thin films. J.P.Larmagnac, J.Grenet, C.Vautier (LECAP, Mont-Saint-Aignan, France).

J. Phys. Colloq. (France), vol.43, no.C-9, p.331-4 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The photo-dependence of the structural relaxation in glassy selenium has been studied by measuring T_g by DTA. The authors note an important increase in the relaxation rate towards equilibrium, for the strongly absorbed wavelengths. The relaxation rate increases as the sample thickness decreases. The relaxation of an existing configuration towards a more favourable one may be explained by the temporary creation of charged defect pairs and their excitation into neutral defects. It is assumed that the diffusion of defects to convenient sites gives rise to structural relaxation. (6 refs.)

66886 Structural investigation of molten and glassy silicates by means of infrared emission spectrometry. K.Kusabiraki, Y.Shiraishi (Res. Inst. of Mineral Dressing & Metall., Tohoku Univ., Sendai, Japan).
J. Phys. Colloq. (France), vol.43, no.C-9, p.351-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A direct method for observing the molecular vibration in the molten state has been developed by means of infrared emission spectrometry. The essential feature of this method consists of a combination of the two emission spectra which are obtained from thin and thick layers of the sample on a metal substrate. The transmission spectrum can be obtained from these emission spectra. The infrared emission spectra of molten alkaline silicates were measured in a range of wave number from 25000 to 400000 m^{-1} and the transmission spectra obtained in the molten state were compared with those of the glassy state. The cooling rate from molten to glassy state in the range of 10^{-2} to 10^4 K/s has little influence on the vibrational spectra of the glassy state. Although the general pattern of infrared spectra of molten silicates is quite similar to that of the glassy state, it is observed that the vibrational frequencies of molten silicates shift toward the lower frequencies and the band shapes are broader than those of glassy state. From the facts that the temperature dependence of these frequency shifts is linear during the transition from molten to glassy state, it may be concluded that the fundamental structure of silicate anion does not differ seriously in the two states. (8 refs.)

66887 Characterization and vibrational spectra of the vitreous domain existing in the ternary diagram Li_2O-CdO-P_2O_5. B.Elouadi, M.Ouchetto, C.Garrigou-Lagrange (Dept. de Chimie, Faculte des Sci., Rabat, Morocco).
J. Phys. Colloq. (France), vol.43, no.C-9, p.359-62 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
X-ray analysis carried out on supercooled melts of mixed Li and Cd phosphates has permitted the determination of the border of a wide glass forming region inside the ternary system Li_2O-CdO-P_2O_5. The heat stability of the isolated glasses has been determined using the annealing technique for 14 hours at different temperatures between 80 and 550°C for many compositions. Raman scattering was used to examine the evolution of glass structure inside the vitreous domain. (10 refs.)

66888 Deviations of structure between bulk and fiber glasses. H.Stockhorst, R.Bruckner (Inst. fur Nichtmetallische Werkstoffe, Tech. Univ. Berlin, Berlin, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.451-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Fibers from a silicate and a metaphosphate glass, produced by the nozzle drawing process are investigated with respect to their structural properties compared with bulk glass. The drawing parameters—nozzle temperature, mass flow and drawing speed—are varied in a wide range. The following properties are investigated: fiber density, thermal expansion-contraction-behaviour and optical birefringence. All these properties show characteristic deviations from the bulk glass values depending strongly on the drawing parameters. The fiber structure is mainly determined by the extreme high cooling rate and by the drawing stress acting on the gob during the fiber drawing process. (14 refs.)

66889 Effect of water content on properties of Na_2O3SiO_2 glasses. M.Takata (Technol. Univ. of Nagaoka, Niigata, Japan), M.Tomozawa, J.Acocella, J.Molinelli, C.Y.Erwin, E.B.Watson.
J. Phys. Colloq. (France), vol.43, no.C-9, p.455-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
$Na_20.3SiO_2$ glasses with up to $\simeq$12 wt.% water were prepared under high-pressure, hydrothermal conditions and their densities, glass transition temperatures, mechanical properties, electrical conductivities, sodium diffusion coefficients and radiation effects were measured. The density, glass transition temperature, hardness and brittleness decreased with increasing water content. The conductivity was to depend on H_2O content in a manner similar to the 'mixed-alkali' effect. Glasses with high water content were found to be extremely resistant to radiation coloration. (16 refs.)

66890 Study of the structural evolution in metallic glass $Fe_{83}B_{14}Si_{1.5}C_{1.5}$ by measuring internal friction and Young's modulus. F.Guyot, F.Fouquet, C.Mai, J.Perez (Groupe d'Etudes de Metall. Phys. et de Phys. des Materiaux, INSA de Lyon, Villeurbanne, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.595-9 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The influence of structural relaxation and of the onset of crystallization on ΔE effect and magnetomechanical damping has been studied in a ferromagnetic metallic glass $Fe_{83}B_{14}S_{1.5}C_{1.5}$. (11 refs.)

66891 Study of structural relaxation induced by irradiation of Se glass by measuring the micromechanical properties. S.Etienne, J.Y.Cavaille (Groupe d'Etudes de Metall. Phys. et de Phys. des Materiaux, INSA de Lyon, Villeurbanne, France), J.Perez, E.Bonjour, R.Calemczuk.
J. Phys. Colloq. (France), vol.43, no.C-9, p.599-602 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
γ irradiation effect on the structural relaxation of selenium glass around the glassy zone is studied by means of mechanical spectroscopy. It is observed (i) aging under γ irradiation permits the reach of structural states characterised by a low molecular mobility together with a high compactness. (ii) γ irradiation does not affect the structural state of the material in an irreversible way. These results are in agreement with those recently obtained using other techniques. (7 refs.)

66892 Magnetic properties and structure of ternary system glasses. C.Chaumont, J.C.Bernier (Dept. Sci. des Materiaux, CNRS, Strasbourg, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.685-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Magnetic properties of splat cooled glasses have been performed in ternary systems $xFe_2O_3(1-x)[BaO,B_2O_3]$ and $xFe_2O_3(1-x)[Li_2O,B_2O_3]$. In respect of Fe_2O_3 content the interpretation of experimental data leads to structural models with deformed tetrahedral and octahedral coordination for iron site. In these glasses, versus increasing Fe_2O_3 concentration, iron atoms are successively isolated, in dimeric or trimeric entities, in clusters in interactions and last in small crystallites. (6 refs.)

66893 Configurations of a chemically ordered continuous random network to describe the structure of $GeSe_2$ glass. R.J.Nemanich, F.L.Galeener, J.C.Mikkelsen,Jr., G.A.N.Connell (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), G.Etherington, A.C.Wright, R.N.Sinclair.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.959-61 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
It is proposed that the structure of $GeSe_2$ glass is characterized by a chemically ordered continuous random network. Within this context it is suggested that 4-atom planar rings exist and can explain an unusual feature in the Raman spectrum. Neutron scattering data are presented which support this model. (12 refs.)

66894 Local structures of amorphous As-chalcogenide systems by means of high Q-neutron scattering and infrared reflection. T.Arai, S.Onari, M.Kato, T.Mori, H.Saegusa, H.Yasuoka, M.Hatori, K.Ohkawa (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan), T.Fukunaga, N.Watanabe.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.965-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Local structure of amorphous As-chalcogenide systems have been studied by means of high Q-neutron scattering and infrared spectroscopy. The local structures of the pyramidal molecular units in single crystals have been retained in the amorphous systems. The layer structure may have also been retained in the amorphous systems. 61.40K Polymers, elastomers, and plastics

66895 Measuring the degree of orientation of polymers by infra-red dichroism. V.A.Khranovskii.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.2, p.96-8 (1983). In Russian.
A study was previously made by V.A. Khranovskii (1978) of the characteristics of the orientation behaviour of soft and hard elements of films of segmented polyurethane carbamide subjected to uniaxial extension, the orientation characteristic f being calculated from the infra-red dichroism. The author examines the possibility of comparing the degree of orientation of soft and hard segments when these are oriented respectively parallel with and transverse to the plane of uniaxial extension. (6 refs.) *A.J.B.*

66896 Thermodeformation properties and structure of polyvinylalcohol films containing boron derivatives. L.I.Khomutov, L.G.Dubina, L.N.Verkhotina.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.2, p.116-18 (1983). In Russian.
An experimental investigation was made of the effect of heating no temperatures in the range 0-300°C on the thermodeformation characteristics of films of polyvinyl alcohol in both the pure state and after complexing with boric acid and sodium tetraborate. The plotted temperature-linear deformation curves show that the introduction of boric acid and a boron salt, which produces significant amorphisation of the polymer, suppresses the initial slight expansion shown by pure polyvinyl alcohol on heating, and causes a progres-

sive contraction on heating, amounting to 30% at 300°C. This degree of contraction could be explained by the presence of gelatine 'spirals' in the complexes polymer. (7 refs.) *A.J.B.*

66897 Influence of the structure of a three-dimensional network on the thermal shrinkage of a polymer. V.I.Dakin, V.L.Karpov.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.2, p.130-4 (1983). In Russian.
Formulae are derived, relating the theoretically-derived thermal shrinkage parameters of a polymer with the experimentally-determined parameters and with the characteristics of the molecular three-dimensional network of the polymer. These results are applied to polymer specimens based on polyethylene, with different network structures. The formulae permit a determination of the nature of change of these characteristics in relation to the structure of the polymer. (8 refs.) *A.J.B.*

66898 Crystallisation in oriented polymers: a framework for analysing orientation distributions. A.S.Abhiraman (Georgia Inst. of Technol., School of Textile Engng., Atlanta, GA, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.583-94 (April 1983).
A framework is presented for analysing the changes that occur in the orientation distribution of polymer segments when crystallisation occurs in an initially amorphous precursor. Existing theories which relate crystalline orientation distribution to that of the precursor can be incorporated in this framework in a straightforward manner. The orientation distribution of segments that remain uncrystallised is inferred from a kinetic analysis of the incorporation of precursor segments into growing crystals. The relevance of such a framework in understanding polymer fabrication processes is discussed briefly with examples in fibre formation from the melt. (19 refs.)

66899 Statistics of 'starburst' polymers. P.G.de Gennes, H.Hervet (Coll. de France, Paris, France).
J. Phys. Lett. (France), vol.44, no.9, p.L351-60 (1 May 1983).
Discusses the growth of a completely branched polymer, based on tertiary amine branch points connected by flexible linear portions ('spacers') each of P monomers. The method is a modified version of the Edwards self consistent fields. The authors find that ideal 'starburst' growth (without any residual secondary amine functions) is restricted to a number of generations $m \leq m_1$ where $m_1 \simeq 2.88(\ln P+1.5)$. This corresponds in space to a limiting radius R_1 which increases linearly with P. Well below this limit, the polymer radius $R(M)$, plotted as a function of molecular weight M, should increase like $M^{0.2}$. Above the limit ($R > R_1$) the authors expect compact structures ($R \sim M^{0.33}$). (4 refs.)

61.50 CRYSTALLINE STATE

(inc. molecular motions in solids; for magnetic structure and spin systems, see 75.25)

66900 Molecular motion, defect structures and phase transitions in oligomer crystals. G.R.Strobl, H.Schwickert, T.Trzebiatowski (Inst. fur Phys. Chem., Univ. Mainz, Mainz, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.274-9 (March 1983).
Defect structures in the high temperature modifications of oligomer crystals can generally be described as a superposition of chain rotations, longitudinal shifts of the molecules and the occurrence of conformational defects. Applying a suitable combination of experimental techniques it is possible to discriminate between the different components of disorder. This is demonstrated in a discussion of results obtained on n-alkanes, cycloalkanes and perfluoro-n-alkanes. (24 refs.)

66901 Peierls distortions in two and three dimensions and the structures of AB solids. J.K.Burdett, S.Lee (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1079-83 (9 March 1983).
Two- and three-dimensional analogues of the well-known Peierls distortion in one-dimensional solids can be used to view the structures of the group 6B and 5B elements and their derivative structures. Starting with the simple cubic structure, the β-tin, graphite, gallium, and arsenic structures are easily generated by this route. It is shown how with a large electronegativity difference between A and B the rocksalt structure (a derivative of the simple cubic arrangement) becomes stable for octet systems, the theoretical reasoning being exactly analogous to that used to stabilize square singlet cyclobutadienes by substitution. (31 refs.)

66902 Hydrogen motion in $Pd_3P_{0.8}H_{0.2}$. D.Noreus, U.Dahlborg (Dept. of Reactor Phys., Royal Inst. of Technol., Stockholm, Sweden), Y.Andersson, R.Tellgren.
Solid State Commun. (USA), vol.46, no.7, p.553-5 (May 1983).
A strong indication of an oscillatory hydrogen motion between two crystallographically equivalent sites separated by ~1.1 Å has been found in the $Pd_3P_{0.8}$ host lattice, at the temperatures 400 and 515K. (4 refs.)

61.50C Physics of crystal growth

(for techniques of crystal growth and film deposition, see 81.10 and 81.15; for epitaxy, thin films, see 68.55; for whiskers, see 68.70)

66903 Influence of gravitation on the processes of heat and mass transfer in solution crystal growth by the travelling heater methods (THM). III. T.A.Cherepanova, Y.V.Apanovich (Computing Center, Latvian State Univ., Riga, Latvian SSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.287-96 (1983).
The effect of the natural and thermocapillary convection on the vortex configuration in solution during growth of a PbTe crystal by the travelling heater method is considered. The estimation of the parameters of growth process (i.e. axial temperature gradients, gravitational acceleration, degree of the solution's surface contact with ampoule), when the vortex configuration undergoes qualitative variation, is given. In terms of the one-dimensional thermodiffusive problem solution the effect produced by the convective stirring on the position of growing and dissolving interfaces is described. (8 refs.)

66904 The influence of time dependence of temperature on the kinetics of nucleation. Z.Kozisek, Z.Chvoj (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.307-13 (1983).
The influence of time dependence of temperature on kinetic processes during nucleation on a simple model is studied. The nucleation rate and the average effective radius of nuclei R is calculated. It is proved that in the case of oscillating temperature the nucleation rate also oscillates and the rate of growth of radius R is directly proportional to frequency of temperature change. (5 refs.)

66905 Plastic bend in a growing crystal. L.G.Eidelman (All-Union's Res. Inst. for Single Crystals, Kharkov, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.405-13 (1983).
In case of nonlinear axial temperature distribution the relaxation of thermoelastic stresses results in the plastic bend of the growing crystal, i.e. in the generation of a residual lattice curvature equal to $\rho.b$. Based on results from Billig (1956) and from Indenbom (1961, 1964) the author presents estimation of dislocation densities (ρ) (i.e. residual lattice curvature) taking into account an elastic limit differing from zero. It is shown that sign and value of the residual lattice curvature may be effectively used as criteria pointing out how thermal conditions should be changed for obtaining more perfect crystals. This approach application allowed to grow larger KCl single crystals (300 m in diameter more than 100 kg by weight) with better structure perfection (specific subboundaries surface 2-3 cm^2/cm^3, mean subgrain dimension 0.6-1 cm, mean mutual disorientation of subgrains of nor more than 6′). (9 refs.)

66906 The melt growth of semicircular crystals of the pure Pb and its dilute alloys. S.Hayashi, M.Fukui, H.Komatsu (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.K38-42 (1983).
Semicircular crystals of Pb were grown from the melt by a rotational operation so as to change the orientation of the solid-liquid interface during crystallization. In pure Pb, specimens grew as polycrystals with grain boundaries developed transversely to the growth direction. According to the decrease in purity, the grown crystals consisted of several long grains along the circular arc. A competitive growth between grains was inhibited by a small amount of impurity and then the mode of growth approached to the complete adhesive one. (4 refs.)

66907 Crystallization of potassium sulfate from pure aqueous solution and in presence of surfactants. F.Kuschel, A.Konig, S.Herold (Sektion Chem., Bergakad. Freiberg, Freiberg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.427-33 (1983).
The use of surfactants offers an interesting possibility in controlling crystallisation from solutions. There are already some applications in the technical field. However, little knowledge exists on the mechanism of the effect and its dependence on surfactant concentration. The displacement rates of selected single crystal faces of K_2SO_4 in pure aqueous solutions have been measured. The critical michelle concentrations have also been determined. Above a transition region characterized by a very irregular growth, growth was practically totally inhibited and dissolution observed. The surface morphology changes induced by surfactants have been investigated using phase contrast microscopy. (17 refs.)

66908 The effect of temperature on the kinetics of scale growth. F.Veverka, O.Sohnel, M.Hlavac (Res. Inst. of Inorganic Chem., Usti, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.527-33 (1983).
The temperature dependence of the kinetics of incrustations growth on heat-exchange surfaces from solutions of NH_4NO_3 was examined. With increasing temperature the formal kinetic exponent of growth decreases and the kinetic constant of growth increases. The linear rate of growth of NH_4NO_3 incrustations increases with rising temperature within the entire range of measured supersaturations. (3 refs.)

66909 The precipitation of alkaline-earth metal polymetaphosphate hydrate powders from aqueous solution. Nucleation and crystal growth processes, final precipitate compositions and crystal sizes. A.Packter, W.O.S.Doherty (Chem. Dept., North-East London Polytech., London, England).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.535-49 (1983).
The precipitation of barium, strontium, calcium and magnesium polymetaphosphate hydrates was studied from aqueous solutions of initial metal salt concentrations from 0.001 to 3M at 20°C; equivalent sodium polymetaphosphate solutions were added to the alkaline-earth metal chloride solutions. Precipitate compositions were determined by chemical analysis, paper chromatography, potentiometric analysis, thermogravimetric and differential thermal analysis and infra-red spectrophotometry; final crystallite morphologies and sizes were studied by scanning electron microscopy and X-ray powder diffraction. (18 refs.)

66910 Kinetics of crystal growth under conditions of low solubility of a crystal-forming substance in a matrix. B.E.Shenker, G.L.Kellerman, G.V.Kleshchev, A.I.Sheinkman, Yu.G.Raspopov (Chelyabinsk State Univ., Chelyabinsk, USSR).
Inorg. Mater. (USA), vol.18, no.5, p.703-5 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.838-40 (May 1982). [received: Feb. 1983]
The kinetics of the growth of titanium dioxide crystals in a melt are described by an exponential equation, the power of which varies over a wide range from 4.5 to 8.3, depending on the heat-treatment temperature. This is due to the

fact that the solubility of the dioxide in the melt is low, and growth of the crystalline particles takes place via a fluctuation mechanism. (11 refs.)

66911 Growth and morphology of single crystals of hexagonal molybdates(IV) $M_2Mo_3O_8$ (M=Mn, Fe, Co, Ni). P.Strobel, Y.Le Page (Solid State Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.329-38 (March 1983).
Chemical vapor transport in the M(II)-Mo(IV)-O system (M=Mn,Fe,Co,Ni) with HCl and $TeCl_4$ as transporting agents was studied. Crystals of the ternary oxides $M_2Mo_3O_8$ of 2 mm size were grown with $TeCl_4$ and their morphology was determined. The crystallization of Fe_2MoO_4 with HCl and of MoO_2 and Te with $TeCl_4$ was consistent with thermodynamic data predicting a higher transport rate of M in the HCl case and of Mo in the $TeCl_4$ case. Attack of the silica tubes was severe for M=Mn and Fe. (22 refs.)

66912 Growth morphology of polar crystals: a comparison between theory and experiment in sucrose. D.Aquilano, M.Franchini-Angela, M.Rubbo (Istituto di Mineralogia e Cristallografia Giorgio Spezia, Univ. di Torino, Torino, Italy), G.Mantovani, G.Vaccari.
J. Cryst. Growth (Netherlands), vol.61, no.2, p.369-76 (March 1983).
The theoretical growth morphology of sucrose has been deduced by means of the theory of Hartman and Perdok (1955). Only hydrogen bonds are considered to build up the periodic bond chains. The forms with F character are the following: $\{100\}$, $\{001\}$, $\{10\bar{1}\}$, $\{110\}$, $\{1\bar{1}0\}$, $\{011\}$, $\{0\bar{1}1\}$, $\{\bar{1}11\}$ and $\{1\bar{1}1\}$. A comparison is made between theoretical and experimental morphology of sucrose crystals grown from pure aqueous solutions. (43 refs.)

66913 Study of local variations in spacing and orientation in a Z-cut plate of a synthetic quartz crystal by X-ray topography. A.Zarka, Liu Lin (Lab. de Mineralogie-Cristallographie, Univ. Pierre et Marie Curie, Paris, France).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.397-405 (March 1983).
Lattice distortion measurements have been undertaken on a *Z*-cut plate of a synthetic quartz crystal, X-ray transmission topographs and plane-wave topographs enabled the authors to give a good assessment of the distortions observed in this crystal. The lattice spacing varies for different growth sectors in the range of $0<\delta d/d<10^{-5}$. Rotations of the (0001) lattice plane around the *Y* and *X* axis have also been measured. (11 refs.)

66914 Solution of partial differential equation of population balance by shifted Legendre polynomials. Maw-Ling Wang, Rong-Yeu Chang (Dept. of Chem. Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Chin. Inst. Eng. (Taiwan), vol.6, no.1, p.31-8 (Jan. 1983).
The batch crystallization processes which are described by partial differential equations of the population density function with appropriate conditions are analyzed. The key method asserts that the population density function can be expressed by a series of shifted Legendre polynomial functions. An effective method which employs a shifted Legendre integral transformation associated with its polynomial functions is applied to solve population balance equations. Making the transformation, the partial differential equation is converted to a series of ordinary differential equations of expansion coefficients. The expansion of the population balance function into shifted Legendre polynomial functions is discussed in detail. The proposed method is straightforward for digital computation and accurate. Illustrative examples are given and compared with the results obtained by the moments method. (12 refs.)

66915 Nucleation and growth of cubic ice in LiCl.n D_2O glasses. A.Elarby Aouizerat, J.F.Jal, J.Dupuy, P.Chieux, A.Wright, R.Parreins (Dept. de Phys. des Materiaux, Lyon Villeurbanne, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.205-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The controlled nucleation of ice in metastable LiCl.n D_2O glassy samples has been followed by neutron scattering. The conditions were determined for cubic ice nucleation as well as for its transformation to hexagonal ice. The structure of the remaining disordered phase has been used to follow the glassy or supercooled matrix concentration along the various steps of the precipitation. A strong modification of the disordered structure is obtained in the nucleation stage. (13 refs.)

66916 The effects of crystallographic orientation, interface type and growth kinetics on Ni distribution between olivine and its melt. A.Kouchi (Inst. of Mineralogy, Petrology & Economic Geology, Tohoku Univ., Sendai, Japan), S.Hosoya, M.Kitamura, H.Takei, I.Sunagawa.
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.167-72 (1983).
The effective distribution coefficient K_{eff} of Ni between solid and liquid has been experimentally determined as a function of growth rates and crystallographic orientations for $(Mg, Ni)_2$-SiO_4 crystals grown by the floating-zone method. Crystals were grown by the continuous mechanism at slow rates, but were faceted at high rates, which enabled the authors to determine the dependence of K_{eff} on orientations and on smooth versus rough interfaces. It has been verified that K_{eff} of Ni becomes larger than the equilibrium value K_0 as the growth rate increases and that K_{eff} of faceted $\langle 110 \rangle$ directions is larger than that of non-faceted higher index directions. The results can be qualitatively explained by the theories which treat the distribution of elements in relation to the growth kinetics. Element distribution during the recovery process from rounded to faceted morphology is also analysed in detail. (35 refs.)

66917 The influence of growth conditions on strains in YAG crystals. A.Valcic, R.Roknic, S.Nikolic (Univ. of Beograd, Inst. for Chem., Technol. & Metall., Beograd, Yugoslavia).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.505-10
The shape of liquid/solid interface in crystal growth can greatly affect the crystal's characteristics. It also has a great effect on the growth mechanism affecting crystal characteristics. During the growth of YAG crystals there appear faces on the liquid/solid interface parts parallel to facets (211) and (110). The mechanism of the crystal's growth is different at the sections where faces appear and where they do not appear. These sections have various parameters of the lattice causing strain in the crystals. Laser rods of high quality could be obtained by cutting crystals of a large diameter out of parts without strain. 61.50E Crystal symmetry; models and space groups, and crystalline systems and classes

66918 Weak asymmetry in β-Si_3N_4 as revealed by convergent-beam electron diffraction. Y.Bando (Center for Solid State Sci., Arizona State Univ., Tempe, AZ, USA).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.185-9 (1 April 1983).
The thickness dependence of th apparent crystal symmetry in a pure β-Si_3N_4 crystal has been studied by the convergent-beam electron diffraction (CBED) technique. The $[11\bar{2}0]$ zone-axis CBED pattern for a thin crystal is compatible with the centrosymmetric space group $P6_3/m$, while that for a thick crystal would require the non-centrosymmetric space group $P6_3$. The thickness dependence of this result is discussed on the basis of the crystal structure of β-Si_3N_4 with space group $P6_3$, in which the structure contains a small antisymmetric group of nitrogen atoms. (10 refs.)

66919 Some additional changes in space groups in published crystal structures. R.E.Marsh, F.H.Herbstein (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.280-7 (1 April 1983).
Revised structures are reported for ten crystalline compounds, based on space groups of higher symmetry than originally deduced. For two of them the Laue symmetry is changed, from $2/m$ to $\bar{3}/m$. For the remaining eight a center of symmetry has been added; for six of these the authors have been able to obtain *F* values and carry out least-squares refinements in the higher-symmetry space groups, with more satisfactory results than originally reported. (21 refs.)

66920 Point symmetry of crystals with a triclinic local order parameter. A.Ya.Mitus', A.Z.Patashinskii (Inst. of Nuclear Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1633-6 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2881-7 (Oct. 1982). [received: April 1983]
An earlier theory of crystal ordering is used to investigate the general case when the local ordering has the lowest admissible symmetry. The local crystal order parameter is an irreducible tensor of rank four $\Lambda_0^{(4)}$ of triclinic symmetry. An expansion of $\Lambda_0^{(4)}$ in terms of point symmetries is obtained and its geometric interpretation is given. The role of the liquid crystal order parameter in phase transitions in a crystal is discussed. General results of the proposed theory and the expansion of $\Lambda_0^{(4)}$ are used to derive an algorithm for the change of the point symmetry due to crystallization and due to phase transitions in a crystal. 66922 Lattice energy of γ-Al_2O_3 & Fe_3O_4 ionic solids with spinel structure. S.Mazumdar, B.Mukherjee (Central Glass & Ceramic Res. Inst., Calcutta, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.982-3 (Dec. 1982). [received: April 1983]
Ewald's method of calculating the lattice sum and hence the Madelung factor is adopted to calculate the lattice energy of γ-Al_2O_3 and Fe_3O_4 ionic solids having spinel structure. (3 refs.)

66923 Molecular orbital calculation of several ices using the pseudolattice method. Kyoung Tal No, Mu Shik Jhon (Dept. of Chem., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
J. Phys. Chem. (USA), vol.87, no.2, p.226-31 (20 Jan. 1983).
Molecular orbital (MO) studies of several ices (I_h, I_c, III, IX, VI) were made by using the pseudolattice method. According to the method water molecules in the ice model experience an identical environment without using periodic boundary conditions. It is found that the stability of ice I_h compared to I_c has its origin in the structural difference of the hydrogen bond parallel to the *c* axis. The difference in binding energy between proton-order and proton-disorder ice I_h is negligible (0.01 kcal/mol), and thus the residual entropy of ice I_h becomes important for determining the proton orderliness. In ice III, the model in which hydrogen atoms are aligned on the O-O bond is energeti-

cally favorable. Linear hydrogen-bond models of ice III and ice IX cannot discriminate between the stability of ice III and ice IX. In ice VI, a linear hydrogen-bond model is considerably unstable because of the repulsive contact of non-hydrogen-bonded neighbors. (38 refs.)

66924 Site preference of dilute hydrogen in palladium. M.I.Darby (Dept. of Pure & Appl. Phys., Univ. of Salford, Salford, England).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L41-3 (April 1983).
A H atom entering the FCC lattice of Pd occupies the octahedral interstitial site in preference to the tetrahedral site. Results are presented which show that the octahedral site is favoured if there is a much smaller difference in the screening for the two sites. Calculations are preformed of the total energy change for the two types of site. (8 refs.)

66925 Van der Waals interactions in the lattice of metallic chains. S.Barisic (Dept. of Phys., Zagreb Univ., Zagreb, Yugoslavia), A.Bjelis.
J. Phys. Lett. (France), vol.44, no.9, p.L327-32 (1 May 1983).
The cohesive energy of a lattice of metallic chains is calculated as a perturbation expansion of the Coulomb interaction, which is assumed small relative to the intrachain overlap integrals. The expansion contains the Van der Waals like interactions associated with the metallic polarizabilities of the chains. For sufficiently large forward interchain coupling (backward contribution neglected), the Van der Waals energy gained on going from the HMTTF-TCNQ to TTF-TCNQ lattice competes with the corresponding loss of the Madelung energy of the charges homogeneously distributed along the chains. (22 refs.)

66926 Electrostatic potentials using direct-lattice summations. V.R.Marathe, S.Lauer, A.X.Trautwein (Inst. fur Phys., Medizinische Hochschule Lubeck, Lubeck, Germany).
Phys. Rev. B (USA), vol.27, no.8, p.5162-5 (15 April 1983).
A direct-lattice summation scheme is described which is completely general for one-, two-, and three-dimensional periodic arrays of point charges. This scheme is based on a proper rearrangement of terms within the lattice sum. Rapid convergence is achieved by appropriate cancellation of multipolar terms. (11 refs.)

61.55 SPECIFIC STRUCTURE OF ELEMENTS AND ALLOYS

61.55D Nonmetallic elements

66927 Structure of 'Orange' $^{18}O_2$ at 9.6 GPa and 297K. D.Schiferl, D.T.Cromer, L.A.Schwalbe, R.L.Mills (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.153-7 (1 April 1983).
A single crystal of 'orange' $^{18}O_2$ at 9.6(3) GPa and 297(1)K was produced in a Merrill-Bassett diamond-anvil high-pressure cell and examined by X-ray diffraction. Pressure was determined with the ruby-fluorescence method. The unit cell is orthorhombic, space group *Fmmm*, lattice constants $a=4.2151(6)$, $b=2.9567(4)$, $c=6.6897(17)$ Å, molar volume$=12.56\times10^{-6}$ m^3 mol^{-1} with four molecules per unit cell. The charge densities of the molecules overlap or distort to a considerable degree. Generalized scattering factors were used in an aspherical-atom least-squares refinement. For five refined parameters and 24 observations the final R_w is 0.056. (27 refs.)

Structural features of amorphous and crystalline red phosphorus ......See Entry 66833

61.55F Metallic elements

66928 The A-15 phase of elements. Yu.I.Vesnin (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.486-8 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.183-5 (May-June 1982). [received: Feb. 1983]
It is known that various metals (for example W) can be obtained in the form of a polymorphic modification having a structure of the type A-15. It was recently found that Nb containing small quantities of added Ge or Si can also crystallize in this structure. It was shown that Vegard's law is effectively fulfilled in the Nb-Ge system over a wide range of concentrations (0.25 at.% Ge). This fact, and also various characteristic features of the phase diagrams of binary systems T-X (where T is a transition metal, and X is any element), indicate that a considerable number of elements T and X may exist in the form of modifications having the A-15 structure. The extrapolation (according to Vegard's law) of data of the lattice parameter of the phase A-15 in its homogeneity range for the systems V-X, Nb-X, and TA-X is presented. The values of the lattice parameter for the elements in the structure of the type A-15, extrapolated from data for different systems, show good agreement (the average discrepancy for three elements T and five elements X does not exceed 0.5%). (7 refs.)

Visual training aids, set no.15: steel and cast-iron (crystalline) structures ......See Entry 64642

61.55H Alloys

66929 A transmission electron microscopical study of the σ phase in an iron-chromium steel. P.G.Self (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England), M.A.O'Keefe, W.M.Stobbs.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.197-209 (1 April 1983).
This paper details several aspects of the σ phase in a duplex stainless steel. The growth and morphology of the phase is characterized and it is demonstrated that under certain conditions the nature of the nucleation and growth produces faulting within the σ-phase particles. The crystalline structure of the phase is discussed with reference to the possibility that it might be that of β-uranium rather than that previously reported. In this connection a comparison is made of the relative usefulness of high resolution and various indirect methods for analysing the structure. In particular, the absences in diffraction patterns and their dependence on crystal tilt and thickness offer an insight into the requirements for accurate structure determination by high-resolution electron microscopy. Finally, the fault structure is examined and a planar (110)-type fault is discussed in detail. (20 refs.)

66930 High pressure phases in the Mn-Yb system. A.V.Tsvyashchenko, S.V.Popova (Inst. of High Pressure Phys., Acad. of Sci., Moscow, USSR).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.211-15 (April 1983).
The crystallization of the intermetallic compounds in the Mn-Yb system was investigated at a pressure of 7.7 GPa and temperatures up to 1300°C. The new phases Yb_6Mn_{23}, Yb_2Mn_{17} and Yb_4Mn_3, all of which are metastable at room pressure, were found under these conditions. (6 refs.)

66931 X-ray investigation of the rare earth metal-iron triad metal-boron systems. Yu.B.Kuz'ma, N.S.Bilonizhko, N.F.Chaban, G.V.Chernyak (I. Franko Lvov State Univ. Lvov, USSR).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.217-22 (April 1983).
Phase equilibrium diagrams were established for the (Nd,Gd)-Ni-B systems. New borides were obtained in the R-(Fe, Co, Ni)-B systems (R≡rare earth) and their crystal structures were determined. The borides $R_3Ni_{13}B_2$ (R≡Tb, Dy, Ho, Er, Tm) have structures of the $Nd_3Ni_{13}B_2$ type, RFe_4B(R≡Er, Tm, Lu) and RNi_4B (R≡La, Pr, Nd, Sm) have the $CeCo_4B$ structure and $Nd_2Co_5B_2$ has the $Ce_2Co_5B_2$ structure. The dependence of the unit volume on the atomic number of the rare earth metal was examined for the series of compounds $R_3Ni_{13}B_2$, RNi_4B, $RCo_{12}B_6$ and $RNi_{12}B_6$. (22 refs.)

66932 High temperature equilibria between BCC and MgCu$_2$-type structures in the Zr$_{1-x}$M$_x$W$_2$ and Hf$_{1-x}$M$_x$W$_2$ (M≡Al,Si) systems. Z.Blazina, Z.Ban (Inst. 'Ruder Boskovic', Faculty of Sci., Univ. of Zagreb, Zagreb, Yugoslavia).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.223-31 (April 1983).
X-ray and metallography investigations of the $Zr_{1-x}Al_xW_2$, $Zr_{1-x}Si_xW_2$, $Hf_{1-x}Al_xW_2$ and $Hf_{1-x}Si_xW_2$ systems were carried out. All the ternary systems investigated showed marked similarities with respect to the limiting concentrations of substituents which corresponded to the formulae $Zr_{0.5}M_{0.5}W_2$ and $Hf_{0.5}M_{0.5}W_2$ (M≡Al, Si). Below a critical temperature all the systems consist of two coexisting phases, a b.c.c. ternary solid solution and a ternary Friauf-Laves structure of the $MgCu_2$ type. The precipitation and/or dissolution temperatures of the $MgCu_2$ phase in the b.c.c. matrix were determined for samples of all the systems investigated. Intensity calculations showed that the substitution in the $MgCu_2$-type structure was unequivocally associated with the 8a positions in the *Fd3m* space group. No ordering phenomena was observed in the high temperature b.c.c. solid solutions. The surprisingly small variations in the lattice constants of both phases and the corresponding short W-W distances are discussed. (3 refs.)

66933 Site occupancies and stoichiometries in hydrides of intermetallic compounds: geometric considerations. D.G.Westlake (Materials Sci. & Technol. Div., Argonne, Nat. Lab., Argonne, IL, USA).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.251-73 (April 1983).
Hole sizes and intersite distances were calculated at various hydrogen concentrations for the interstices in hydrides of $TiCr_{1.8}$, $ZrTi_2$, ZrV_2, $ZrCr_2$, $ZrFe_2$, HfV_2 and TaV_2 with the cubic $MgCu_2$ C15 structure and of $ZrMn_2$ and $ErMn_2$ with the hexagonal $MgZn_2$ C14 structure. From a survey of other metallic hydrides, empirical criteria were chosen for the minimum hole size (0.40 Å) and the minimum H-H distance (2.1 Å) for hydrogen atom occupancy in stable hydrides. With these criteria, a model was developed for predicting which sites and how many of them could be occupied by hydrogen atoms in each of the intermetallic compounds listed. The resulting stoichiometries were determined by experimentally filling the interstices of model lattices constructed of Friauf polyhedra without violating either of the adopted geometric criteria. (44 refs.)

66934 On some ternary La-Co-Zn alloys. V.Contardi, G.Zanicchi, R.Marazza, R.Ferro (Inst. of General & Inorganic Chem., Univ. of Genoa, Genoa, Italy).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L25-6 (April 1983).
Reports crystal structure data for the ternary alloys, $La(Co,Zn)_{13}$. The materials were examined using a metallographic microscope and by X-ray power diffraction. (12 refs.)

66935 Lattice parameters of RZnTl compounds (R≡rare earth element). D.Mazzone, D.Rossi, R.Marazza, F.Ferro (Istituto di Chimica Univ de Genova, Genoa, Italy).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L35-6 (April 1983).
Reports a study of the lattice parameters and unit cell dimensions by X-ray powder diffraction for the alloys: LaZnTl, CeZnTl, NdZnTl, SmZnTl, GdZnTl, DyZnTl, ErZnTl. (3 refs.)

66936 Powder neutron diffraction study of nickel-titanium martensite. W.Buhrer (Inst. fur Reaktortech., Swiss Federal Inst. of Technol., Wurenlingen, Switzerland), R.Gotthardt, A.Kulik, O.Mercier, F.Staub.
J. Phys. F (GB), vol.13, no.5, p.L77-81 (May 1983).
The structure of the martensitic phase of the shape memory alloy NiTi has been determined from a power neutron diffraction study at 10K. The lattice is monoclinic, space group $P2_1/m(C_{2h}^{\,2})$ with $a=2.884(2)$ Å, $b=4.110(2)$ Å, $c=4.665(3)$ Å, $\beta=98.10(4)°$ and $Z=2$. The structure has been refined to an $R_{WP}=0.12$; remaining descrepancies are associated with shape memory effects and are discussed in relation to the phase transition. (14 refs.)

66937 Monocarbide characterization in nickel-base MC aligned eutectics. M.R.Jackson, M.F.X.Gigliotti, S.W.Yang, J.L.Walter (General Electric Corporate Res. & Dev., Schenectady, NY, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.155-65
In the aligned Ni-MC eutectic alloys being developed for jet engine blade applications, the fibers are considered to be TaC, TiC, etc. In fact, these fibers will contain Cr, Mo, W and possibly other elements as substitutions for the 'M' constituent, and often will not be stoichiometric. Quantitative chemical analysis of fibers is difficult because of their size. However, lattice parameter measurements can be used to learn much about the carbide chemistry and stoichiometry. Results are for fibers extracted from simple Ni-TaC, Ni,Cr-TaC and Ni,Cr, Al-TaC systems. In addition, experiments on mixed (Ta,V)C and (Ta,Ti)C carbides are discussed. Carbide lattice parameters can be understood in terms of the free energies of formation of the various carbides. (15 refs.)

61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

66938 Non-linear model of structures and phase transitions of the SiO_2 crystal family. G.Behnke, H.Bilz, H.Buttner (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.193-6 (March 1983).
The polymorphism and the phase transitions of the silica family are explained in terms of a quasi-one dimensional lattice model. The origin of the different SiO_2-structures is found in two microscopic potentials. The first potential describes the covalent bonding due to the tetrahedral (sp^3) silicon coordination and the twofold ($p\sigma$) oxygen coordination. The second potential is a local double-well potential due to the non-linear polarizability of the non-bonding ($p\pi$) electrons at the oxygen site. This potential is equivalent to a fourth-order electron-lattice interaction which may be responsible for the low-symmetry modifications of the SiO_2-crystals. It turns out that the different crystals with 1,2,3,4 and 6-fold screw axes correspond to possible commensurate static solutions of the potential. The model also includes incommensurate states which may be interpreted as the vitreous structures of the silica. (14 refs.)

66939 Orientational disorder of complex cations and anions in high-temperature phases of ionic compounds. Results of three-dimensional electron density calculations on the basis of X-ray diffraction data. H.J.Berthold, H.-G.Bathge, B.G.Holscher, H.-J.Kienert, W.Ludwig, J.M.Molepo, R.Wartchow (Inst. fur Anorganische Chemie, Univ. Hannover, Hannover, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.245-8 (March 1983). In German.
The crystal structures of the orientationally disordered cubic high-temperature phases of $NaClO_4$, $RbClO_4$, $CsClO_4$, $AgClO_4$, and $Co(C_5H_5)_2ClO_4$ have been investigated using single crystal X-ray diffraction data. In the case of $NaClO_4$ and $AgClO_4$ the ClO_4-tetrahedra occupy 6 orientations, characterized by the fact that in each orientation only one of the three $\bar{4}$-axes of the tetrahedra lies parallel to the cubic crystal axes. In $RbClO_4$ and $CsClO_4$ the orientational disorder comprises 2 orientations of the ClO_4-tetrahedra. In both of them all three $\bar{4}$-axes simultaneously point into the directions of the cubic crystal axes. $Co(C_5H_5)_2ClO_4$ transforms at 376K from the tetragonal room-temperature structure (space group I4/mcm, $Z=16$) into a primitive cubic structure (space group Pm3m, $Z=1$), in which the sandwich-like $Co(C_5H_5)_2^+$-cations and the ClO_4^--anions are orientationally disordered. The electron density distribution around the Co-atom proves that the cations occupy statistically three different orientations with the fivefold axis parallel to the *x*-, *y*-or *z*-direction. (16 refs.)

66940 Investigation of the structure of solid solutions of elements of the IV. Group (Si, Ge) in gallium antimonide. J.Wilke, V.T.Bublik, V.B.Osvenskii, A.N.Popkov, A.G.Braginskaya, G.P.Kolchina (Moscow Inst. of Steel & Alloys, Moscow, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.329-37 (1983).
Precision measurements of the lattice parameter and the density of Si- and Ge-doped GaSb monocrystals were accomplished. The investigated crystals were Czochralski-grown from an equiatomic melt (with respect to its own components) and doped with 2×10^{17} to 4×10^{19} cm^{-3} Si and 2×10^{17} to 4×10^{19} cm^{-3} Ge, respectively. The concentrations of the dopants were determined spectroscopically. Hall measurements at room temperature showed that Si as well as Ge in GaSb produce p-conduction. (2 refs.)

66941 Anisotropy of temperature factors and interatomic forces in II-IV-V_2 semiconductors. A.A.Vaipolin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.415-21 (1983).
An incomplete set of X-ray reflections with high indices ('back' reflections by $MoK_{\alpha1}$-radiation) was measured for six II-IV-V_2 semiconducting compounds of the chalcopyrite structure. The site parameter of the V-atom and the temperature parameters proportional to the components of mean square displacements of atoms ($B_{ik}=8\pi^2\bar{u}_{ik}^2$) were determined. General peculiarities of the relation of temperature factor constants and its variation within this family of compounds are reported. A qualitative crystallochemical interpretation of this relation is proposed on the basis of the atomic interaction scheme taking into account the principal and auxiliary bonds in the first and the second coordination sphere, respectively. (6 refs.)

66942 The influence of Bi on the lattice constant and the carrier concentration of PbTe. Ngo Dien Tap, M.Schenk, P.Schafer (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.K33-4 (1983).
The authors investigated the connection between Bi content N_{Bi}, carrier concentration *n*, and lattice constant *a* of TbTe(Bi) epitaxial layers. The layers were investigated by high precision lattice constant measurements, carrier concentration measurements, and modified mass spectroscopic measurements. It was concluded that Te excess atoms, originated by the incorporation of Bi at cation lattice sites, cause Pb vacancies. (6 refs.)

66943 Precision lattice parameter determination of coloured quartz monocrystals. S.Grosswig, J.Hartwig (Friedrich-Schiller-Univ., Jena, Germany), U.Alter, A.Christoph.
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.501-11 (1983).
Several possibilities for the determination of relative lattice parameter changes and for the absolute measurement of lattice parameters are discussed. Special attention has been given to a measuring device for the high-precision lattice parameter determination using the BOND method. This device allows one to determine the lattice parameters with a relative accuracy of 2×10^{-7}. As an example the methods discussed are applied to the investigation of a smoky coloured quartz crystal plate and the results obtained by them are compared. (40 refs.)

66944 The effects of anisotropic atom-atom interactions on the crystal structure and lattice dynamics of solid CS_2. E.Burgos (Div. Fisica des Solido, Comision Nacional de Energia Atomica, Buenos Aires, Argentina), R.Righini.
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.584-90 (22 April 1983).
Good agreement with the experimental structure and with the observed lattice frequencies of crystalline CS_2 is obtained using an intermolecular potential consisting of an electrostatic part and of an anisotropic atom-atom potential. The role of anisotropic short-range interactions in the statics and dynamics of linear-molecule crystals is discussed. (20 refs.)

66945 The chemical bonding in lithium metaborate, $LibO_2$. Charge densities and electrostatic properties. A.Kirfel, G.Will (Mineralogisches Inst. Univ. Bonn, Bonn, Germany), R.F.Stewart.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.175-85 (1 April 1983).
The room-temperature electron density distribution in $LiBO_2$ has been studied by X-ray diffraction experiments up to $s=1.08$ Å^{-1}. Conventional structure refinements both with HF scattering factors for the neutral atoms and with the monopole parts of generalized scattering factors (GSF) calculated from the diatomic-molecule wavefunctions of LiO and BO yielded $R_w^{HF}=0.0251$ and $R_w^{GSF}=0.0192$ for 1266 observed reflections. (23 refs.)

66946 The structure of potassium-exchanged heulandite at 293, 373 and 593K. E.Galli, G.Gottardi (Istituto di Mineralogia e Petrologia, Univ. di Modena, Modena, Italy), H.Mayer, A.Preisinger, E.Passaglia.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.189-97 (1 April 1983).
Single crystals of heulandite were potassium-exchanged to reach a chemical composition of $(Na_{0,10}K_{8,57}\text{-}Ba_{0,04})(Al_{9,31}Si_{26,83})O_{72}.19.56H_2O$. Thermogravimetry up to 593K of such single crystals was carried out concurrently with the X-ray diffraction measurements of one single crystal at 293, 373 and 593K. At 593K the sample was fully dehydrated. The crystal structures were refined by least squares to R_w values of 0.073 (293K), 0.090 (373K) and 0.112 (593K). [Crystal data for the first structure (293K): *C2/m*, $a=17.767(7)$, $b=17.958(7)$, $c=7.431(1)$ Å, $\beta=115.93(2)°$.] The crystal structure at 593K is essentially in agreement with that at 293K of a single crystal previously heated to 573K in an evacuated and sealed glass capillary. The process of dehydration is represented by these crystal structure determinations showing the change of the water molecules and the positions of the K^+ ions as well as the deformation of the silicate framework. (13 refs.)

66947 Analysis of the incommensurate structure in $Sr_2Nb_2O_7$ by electron microscopy and convergent-beam electron diffraction. N.Yamamoto (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA), K.Ishizuka.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.210-16 (1 April 1983).
The incommensurate lattice modulation in $Sr_2Nb_2O_7$ has been studied by the high-resolution dark-field technique, which revealed curved lattice fringes showing the irregularity of the modulation wave inside the crystal on a relatively large scale. Convergent-beam electron diffraction patterns were analyzed to derive the symmetry of the incommensurate lattice modulation and that of the fundamental lattice. The results were compared with the previously proposed atom-displacement model. (17 refs.)

66948 Structure and crystal chemistry of mixed-valence ternary platinum oxides: $MnPt_3O_6$, $CoPt_3O_6$, $ZnPt_3O_6$, $MgPt_3O_6$, and $NiPt_3O_6$. K.B.Schwartz, J.B.Parise, C.T.Prewitt (Dept. of Earth & Space Sci., State Univ. of New York, Stony Brook, NY, USA), R.D.Shannon.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.217-26 (1 April 1983).
The structures of the mixed-valence series of MPt_3O_6 compounds with approximate compositions $MnPt_3O_6$, $CoPt_3O_6$, $ZnPt_3O_6$, $MgPt_3O_6$, and $NiPt_3O_6$ have been refined from neutron powder diffraction experiments. The first four were isostructural with the prototype *C*-centered $CdPt_3O_6$, containing a rigid framework of planar PtO_4 and octahedral PtO_6 groups and a distorted eight-coordinated counterion site consisting of two interpenetrating rectangular planes. Further distortions of the counterion site in $NiPt_3O_6$ caused a change in symmetry to a primitive lattice, thereby distinguishing its structure from those of the other known MPt_3O_6 compositions. The presence of some cation disorder and vacancies was established from refinements of site occupancies constrained by known values of counter-ion content determined by independent chemical analysis. The $MnPt_3O_6$ structure was refined in *Cmmm* with $Z=2$ [$a=7.152(1)$, $b=10.045(1)$, $c=3.1476(3)$ Å] by the Rietveld profile technique to a final $R_{wp}=0.171$ for data collected at $\lambda=1.30$ Å. The $CoPt_3O_6$, $ZnPt_3O_6$, and $MgPt_3O_6$ structures were also refined in *Cmmm* using integrated intensities for data collected at $\lambda=2.46$ Å to $R_w=0.041$, 0.046, and 0.076, respectively. The $NiPt_3O_6$ structure was refined in *Pbam* with $Z=2$ [$a=7.123(1)$, $b=9.933(1)$, $c=3.100(1)$ Å] from similar data to a $R_w=0.050$. (28 refs.)

66949 Protonic solid electrolytes: a single-crystal neutron diffraction study of ammonium-hydronium β''-alumina. J.O.Thomas (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden), G.C.Farrington.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.227-35 (1 April 1983).
The structure and ionic distribution in the conducting plane of ammonium-hydronium β''-alumina, a solid electrolyte with high protonic conductivity, have been determined by single-crystal neutron diffraction. The composition, constrained in the refinement to neutrality, is: $(NH_4^+)_{1.56}(H_3O^+)_{0.19}Mg_{0.75}Al_{10.25}O_{17}\text{-}(H_2O)_{0.25}$, with three such units per unit cell. The hexagonal cell dimensions are: $a=5.6310(4)$, $c=34.378(6)$ Å, $V=944.0$ Å^3, for the rhombohedral space group *R3m*. $R(F^2)=0.035$, $R_w(F^2)=0.049$ for 1505 reflections. The structure comprises spinel blocks of Al atoms, tetrahedrally or octahedrally coordinated to O atoms. One of the two tetrahedrally coordinated Al^{3+} sites is occupied to 37% by Mg^{2+} to provide charge compensation in the structure. The site Al(2) is near the centre of the spinel block ($z\sim0$). The NH_4^+ ions occupy 6(*c*) sites in the

conducting planes which interleave the spinel blocks at $z=\pm{}^1/_6$ and ${}^1/_2$, with a partial site occupation of 78%. When such sites are not occupied by NH_4^+ ions, they are occupied by either an H_2O molecule or an H_3O^+ ion, with a statistical ratio between the two of 4:3. The distance from the O atom of the H_2O molecule or H_3O^+ ion to the $\bar{3}$ axis is 0.84(1) Å. Site-occupation considerations suggest a Grotthus-type mechanism for proton transfer involving three components: rotational translation of H_3O^+ and H_2O, and proton transfer from H_3O^+ to H_2O. (25 refs.)

66950 $[Fe_4Te_8]$-cluster $Cs_7Fe_4Te_8$; a new type of structure in ternary metal chalcogenides. W.Bronger, M.Kimpel, D.Schmitz (Inst. fur Anorganische Chem., Tech. Hochschule Aachen, Aachen, Germany).

Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.235-8 (1 April 1983). In German.

The crystal structure of $Cs_7Fe_4Te_8$ has been determined by single-crystal X-ray techniques. The crystals are monoclinic, $C2/c$, with $a=20.569(6)$, $b=9.306(3)$, $c=18.235(4)$ Å, $\beta=117.48(2)°$ and $Z=4$. Full-matrix least-squares refinement of 1595 independent observed reflexions gave a conventional R index of 0.038. The atomic arrangement $[Cs_7(Fe_4)]Te_8$ corresponds to that in cesium chloride. The outstanding feature of the crystal structure is the occurrence of isolated $[Fe_4Te_8]$ clusters, in which the Fe atoms are tetrahedrally surrounded by Te atoms and four tetrahedra are mutually linked such that each is joined to the others via three edges, corresponding to $[FeTeTe_{3/3}]_4$. (7 refs.)

66951 The charge density distribution in $LiAlB_{14}$. T.Ito, I.Higashi (Inst. of Phys. & Chem. Res., Saitama, Japan).

Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.239-43 (1 April 1983).

The charge density distribution in $LiAlB_{14}$ has been investigated by X-ray diffractometry. Population analysis of valence electrons with a least-squares method ($R=0.019$, $R_w=0.035$ for 1895 reflections) resulted in a net charge distribution of Li^{1+}-$(Al^{1.7+})_{0.96}(B_{12})^{1.2-}.2B^{0.7-}$. On the other hand, charge integration around the metal atoms within the spheres of radii 1.08 and 1.15 Å for Li and Al respectively gave net charges of $Li^{0.7+}$ and $Al^{1.5+}$. These results indicate that the structure of $LiAlB_{14}$ is stabilized by charge transfer from the metals to the electron-deficient boron framework. Deformation maps through the triangular faces of the B_{12} icosahedron showed accumulation of charges at the centers of the faces, which is a characteristic feature of delocalized three-center bonds. The bonding-electron peaks of the strained intericosahadral B-B bonds are not located on the bonds but shifted toward the pseudo fivefold axes of the icosahedron, indicating that the bonds are bent. Around the metal atoms prominent peaks were observed which are much sharper and closer to the atomic centers than expected for the valence electrons of free metal atoms. (9 refs.)

66952 Refinement of the crystal structure of arsenic telluride As_2Te_3. A.S.Kanishcheva, Yu.N.Milhailov, A.P.Chernov (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.6, p.796 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.949-52 (June 1982). [received: Feb. 1983]

A three-dimensional diffractometer study and full-matrix anisotropic refinement using the method of least squares is used to describe the structure of As_2Te_3 crystals which had been known previously only from two-dimensional data. Analysis of the details concerning bond lengths and bond angles reveals features of the coordination of nonequivalent arsenic atoms. Different extents of activity and localization of the unshared electron pair at these atoms were proposed. (6 refs.)

66953 Crystal, molecular, and electronic structures of tetrasulfur dinitride, S_4N_2. T.Chivers, P.W.Codding, W.G.Laidlaw, S.W.Liblong, R.T.Oakley, M.Trsic (Dept. of Chem., Univ. of Calgary, Calgary, Alberta, Canada).

J. Am. Chem. Soc. (USA), vol.105, no.5, p.1186-92 (9 March 1983).

A simple method for obtaining high-purity S_4N_2 crystals is described. The crystal and molecular structure of S_4N_2 at $-100(5)°C$ has been determined by X-ray diffraction. Crystal of S_4N_2 are tetragonal, space group $P4_2nm$, $a=b=11.146$ (4) Å, $c=3.773$ (1) Å, $V=468.7$ Å^3, and $Z=4$. The refined structure ($R=0.021$) shows the molecule to be a six-membered ring with the nitrogen atoms in the 1,3-positions. The molecule adopts a half-chair conformation with the central sulfur of the trisulfide unit lifted out of the plane of the remaining five atoms, producing a dihedral angle of 54.9°. MNDO and ab initio Hartree-Fock-Slater SCF calculations on a variety of model S_4N_2 structures show that the observed conformation is preferred by 6-10 kcal mol.$^{-1}$ over a planar structure. The electronic structure and bonding are discussed on the basis of the HFS calculations on the crystal structure geometry and a related planar model. UV-visible absorption and vibrational spectra are also reported. (42 refs.)

66954 X-ray diffraction data from the high pressure phase of AlSb. M.Baublitz,Jr., A.L.Ruoff (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.2109-10 (April 1983).

Powder diffraction data from a high pressure phase of AlSb have been obtained using the energy dispersive diffraction technique with synchrotron radiation from the Cornell High Energy Synchrotron Source. The diffraction pattern of the high pressure phase of AlSb has been indexed with an orthorhombic unit cell. (11 refs.)

66955 Structural studies of low temperature ice I_h using a central force potential model. P.Deutsch (Dept. of Phys., Pennsylvania State Univ., Monaca, PA, USA), B.N.Hale, R.C.Ward, D.A.Reago,Jr..

J. Chem. Phys. (USA), vol.78, no.8, p.5103-7 (15 April 1983).

The revised central force potentials of Stillinger and Rahman [J. Chem. Phys., vol.68, p.666 (1978)] are used to study the binding energy, structure and multipole moments of a periodic ice I_h sample with a unit cell of 192 water molecules. The initial configuration for the unit cell has each oxygen in a wurtzite structure and intramolecular H-O-H angles symmetrically positioned in the tetrahedral O-O-O angles. Hydrogens are placed such that the total dipole moment for the unit cell is zero and the diagonal quadrupole moments are small ($\lesssim 10^{-28}$ esu cm^2). Subject to these restrictions, a static energy minimization on the periodic ice crystal yields an optimal O-O separation, intramolecular O-H distance, and intramolecular H-O-H angle of 2.78, 0.972 A, and 101.0°, respectively. Starting from this idealized wurtzite configuration, Metropolis Monte Carlo runs on the periodic system are made at 20 and 200K. At 20K, the equilibrated system has an average intermolecular potential energy per molecule of -15.2 kcal/mol and structure factors which have decreased to about 80% of the initial values. The dipole moment for the unit cell is $\simeq 3$ D. The equilibrated system at 200K appears to be modified only by temperature dependent vibrational effects. (14 refs.)

66956 Neutron scattering study on distribution of cations in α-AgI-type superionic conductors. S.Hoshino (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), T.Sakuma, H.Fujishita, K.Shibata.

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1261-9 (April 1983).

Neutron diffuse scattering from powder samples of α-AgI type superionic conductors AgI, Ag_3SI and Ag_2S was measured using a triple-axis spectrometer with a fixed position of the energy analyzer so as to measure only the elastic scattering caused by a disordered distribution of cations. The disorder scattering curves thus obtained were analyzed under the assumption that Ag atoms distribute over crystallographic 12(d) sites among the BCC lattice formed by anions, and probability functions α_n for a simultaneous occupation in the n-th neighbor sites were obtained. The results are discussed in comparison with the pair correlation function $g_{Ag-Ag}(r)$ obtained theoretically as well as by the analysis of X-ray diffuse scattering based on a liquid-like distribution model. The liquid phase of AgI was also studied by the same neutron technique and the results are discussed together with those for the solid phase. (22 refs.)

66957 Preparation and properties of some curium silicides. F.Weigel, R.Marquart (Radiochem. Abteilung, Insts. fur Anorganische Chem., Univ. Munchen, Munchen, Germany).

J. Less-Common Met. (Switzerland), vol.90, no.2, p.283-90 (April 1983).

Curium monosilicide (CmSi), curium sesquisilicide (Cm_2Si_3) and curium disilicide ($CmSi_2$) were prepared by the reduction of curium trifluoride with stoichiometric amounts of elemental silicon in vacuo at 1260°C (CmSi), 1200°C (Cm_2Si_3) and 1260°C ($CmSi_2$). CmSi was obtained as a black coke-like mass isomorphous with LaSi and CeSi. It was found to have an orthorhombic lattice with $a=5.954\pm0.089$ Å, $b=8.278\pm0.126$ Å and $c=3.914\pm0.044$ Å (space group, $Pnma$) with four formula units per unit cell and $D_x=9.36$ g cm^{-3}. Cm_2Si_3 was obtained as a bright silvery crystalline material with filamentary grains. It was found to have a hexagonal lattice of the β-$PuSi_2$ type with $a=3.870\pm0.008$ Å and $c=4.145\pm0.021$ Å (space group, $P6/mmm$) with two formula units per unit cell and $D_x=8.84$ g cm^{-3}. $CmSi_2$ formed silvery platelets with a tetragonal α-$ThSi_2$-type structure with $\alpha=3.963\pm0.012$ Å and $c=13.720\pm0.033$ Å (space group, $I4_1/amd$) with four formula units per unit cell and $D_x=9.26$ g cm^{-3}. (9 refs.)

66958 The structure of dehydrated zeolite 3A (Si/Al=1.01) by neutron profile refinement. J.M.Adams, D.A.Haselden (Edward Davies Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales).

J. Solid State Chem. (USA), vol.47, no.2, p.123-31 (April 1983).

A neutron powder diffraction study of a dehydrated commercially available potassium exchanged zeolite A (Linde 3A) has shown that the diffraction pattern can be indexed in cubic space group $Fm3c$. For this sample there is 63% exchange of potassium for sodium ($K^+/Na^+=1.69$). Data collected at a neutron wavelength of 2.98 Å shows no evidence of rhombohedral distortion and suggests that the assignment of space group $Fm3c$ is correct. The final structural model is closely analogous to that found for dehydrated sodium zeolite A (Adams et al., 1982; Pluth and Smith, 1980). Unusual features of previous refinements of potassium containing zeolite A samples, i.e. 'zero coordinate' cations (Leung et al., 1979) or potassium inside the β-cage (Pluth and Smith, 1979) have not been found. Refinements using the same 1.9 Å neutron powder diffraction data were also obtained with the models of Leung et al. and Pluth and Smith, 1979, as starting points (denoted LKSM and PS, respectively) and comparison is made with these. The final R factors for the three refinements were R_{pw} (Cheetham and Taylor, 1977)=10.24% for the model presented here, $R_{pw}=10.38\%$ (PS model), and $R_{pw}=10.61\%$ (LKSM model). (32 refs.)

66959 $VOCl_3$: crystallization, crystal structure, and structural relationships: a joint X-ray and ^{35}Cl-NQR investigation. J.Galy, R.Enjalbert, G.Jugie (Lab. de Chimie de Coordination, CNRS, Toulouse, France), J.Strahle.

J. Solid State Chem. (USA), vol.47, no.2, p.143-50 (April 1983).

Cooling of $VOCl_3$ below its melting point (196K) yields an amorphous phase, which transforms into the crystalline state upon further cooling. The crystallization is accompanied by a remarkable change in color from pale yellow to deep orange. A single crystal has been grown from the amorphous phase. $VOCl_3$ crystallizes in the orthorhombic system, space group $Pnma$, with lattice parameters $a=4.963(1)$, $b=9.140(4)$, $c=11.221(5)$ Å at 133K; $Z=4$. The ^{35}Cl-NQR experiments show two signals at approximately 11.4 MHz of intensity 2:1, which implies two different crystallographic sites for chlorine atoms, in agreement with the centrosymmetric space group $Pnma$. The crystal structure exhibits isolated tetrahedral molecules of $VOCl_3$ lying on a mirror plane and stacked with their V-O axes along [100] to form trigonal prismatic columns. A close relationship exists with the structure of $AsBr_3$, in which the lone pair occupies the position corresponding to the oxygen atoms. (13 refs.)

66960 The hollandite-related structure of $Ba_2Ti_9O_{20}$. G.Grzinic, L.A.Bursill (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia), D.J.Smith.

J. Solid State Chem. (USA), vol.47, no.2, p.151-63 (April 1983).

The crystal structure of $Ba_2Ti_9O_{20}$ has been determined by comparison of experimental high-resolution electron micrographs with images simulated using structural models deduced from the micrographs in conjunction with crystallochemical principles. The structure consists of lamellae of hollandite-type structure alternating with $BaTiO_3$-like units, which effectively immobilize the Ba ions. This material should be relatively more leach resistant to attack by aqueous sodium chloride solutions. The structure determination clarifies the observation that this material has unique properties as a microwave resonator, compared with other barium and alkali titanate structures. (18 refs.)

66961 Synthesis, characterization, and crystal structure of a new truly one-dimensional compound: PV_2S_{10}. R.Brec, G.Ouvrard, M.Evain, P.Grenouilleau, J.Rouxel (Lab. de Chimie des Solides, Nantes, France).

J. Solid State Chem. (USA), vol.47, no.2, p.174-84 (April 1983).

PV_2S_{10} was obtained by heating the elements in stoichiometric proportions at 490°C in evacuated Pyrex tubes. The crystal symmetry is monoclinic, space group $P2_1/c$, with unit cell parameters $a=12.734(8)$ Å, $b=7.349(7)$ Å, $c=23.662(4)$ Å, $\beta=95°22(1)$, $V=2205(4)$ Å^3, and $Z=8$. The structure was solved from 2269 independent reflexions, and anisotropic least squares refinement gave $R=0.036$ with 236 variables. The structure can be described as made of $[V_2S_{12}]$ units forming endless chains, themselves linked, two by two, by $[PS_4]$ tetrahedra. In these units each vanadium is surrounded by eight sulfur atoms (mean $d_{V-S}=2.459$ Å) arranged in a distorted bicapped triangular prism. Two of these prisms shared a rectangular face to form $[V_2S_{12}]$ groups, in which intercationic distances implied vanadium-vanadium bonds (mean $d_{V-V}=2.852(2)$ Å). Between the infinite double chains, only S-S weak van der Waals bonds exist. More than two-thirds of the sulfur atoms are present as $[S\text{-}S]^{-II}$ pairs, (mean $d_{S-S}=2.015$ Å); the rest are S^{-II} anions. (12 refs.)

66962 A crystal chemical study of stishovite. R.J.Hill (Div. of Mineral Chem., CSIRO, Port Melbourne, Victoria, Australia), M.D.Newton, G.V.Gibbs.

J. Solid State Chem. (USA), vol.47, no.2, p.185-200 (April 1983).

The crystal structure of stishovite, SiO_2, $a=4.1773(1)$, $c=2.6655(1)$ Å, space group $P4_2/mnm$, with $Z=2$, has been refined with 217 graphite-monochromatized Mo$K\alpha$ data (2θ max$=120°$) to $R=0.012$ ($R_W=0.014$). Electron deformation density maps show a modest accumulation of charge density ascribed to partial covalent bonding in both the equatorial and axial bonds together with a delocalization of density in and around the shared octahedron edges with the shorter equatorial bonds showing higher peaks (0.47 e Å^{-3}) than the longer axial bonds (0.29 e Å^{-3}). Net atomic charges for Si and O determined by a population and κ refinement by varying the occupancy and shape of their valence shells are +1.71 and −0.86(15)e, respectively. The observed structural distortions and charge distributions conform with the results of ab initio molecular orbital calculations undertaken on molecules designed to mimic the local geometry of the structure of stishovite. The Si-O bond length (1.73 Å) calculated for a neutral molecule with 6-coordinatd Si is slightly shorter than that observed on the average (1.76 Å) for silicates and molecular crystals with 6-coordinated Si. In addition, the calculated geometrical parameters of two edge-sharing octahedra agree to within ~5% of the observed geometry of stishovite. The calculated charge on Si is indicated to increase with coordination number and bond length in agreement with the larger net charge recorded for stishovite as compared with that recorded for α-quartz, $Q(\mathrm{Si})=+1.0\ e$. Observed deformation maps are compared with theoretical ones calculated in the equatorial plane of the 6-coordinated molecule using molecular orbital theory with a split valence s,p basis supplemented with d-type polarization functions on Si. (66 refs.)

66963 The crystal structure of $CsYb_3F_{10}$: refinement in a higher-symmetry space group. R.E.Marsh (Arthur Amos Noyes Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Solid State Chem. (USA), vol.47, no.2, p.242-3 (April 1983).
The author begins by outlining the results of Aleonard et al. (1982) for the crystal structure of $CsYb_3F_{10}$. These authors were unable to refine in Pmcm below an R of 0.09 and reported that the isotropic temperature factors became unacceptably large. They therefore chose the monoclinic space group Pc for the $CsYb_3F_{10}$ structure. This refinement experience is different for the author who reports that the Pmcm structure leads to a quite satisfactory R and to no unusual temperature factors. (3 refs.)

66964 Thermal stability and crystal structure of the double molybdate $Li_7Ho_3(MoO_4)_8$. E.N.Ipatova, R.F.Klevtsova, L.P.Solov'eva, P.V.Klevtsov (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.418-22 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.115-19 (May-June 1982). [received: Feb. 1983]
The compound $Li_7Ho_3(MoO_4)_8$ undergoes thermal decomposition at 725°C to the double molybdate $LiHo(MoO_4)_2$ (solid) and normal Li_2MoO_4 (liquid). It crystallizes in a triclinic unit cell with parameters: $a=5.191$, b=6.729, c=10.729 Å, $\alpha=108.10$, $\beta=100.19$, γ-66.31°, space group P1, Z=0.5. The crystal-chemical content of the cell is: $Li_3(Ho_{0.75}Li_{0.25})_2(MoO_4)_4$. The crystal structure is made up of layers of eight-apex M polyhedra (M=0.75 Ho+0.25 Li), joined through shared edges and shared apices with the Mo tetrahedra surrounding them. The layers are parallel to (001) and are jointed to one another through Li atoms. The structure is closely related to the scheelite structure. (9 refs.)

66965 X-ray investigation of electron-irradiated quartz. D.Grasse, D.Muller, H.Peisl, C.Laermans (Sektion Phys., Ludwig-Maximilians Univ., Munchen, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.119-22 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
An X-ray study on electron-irradiated quartz single crystals (dose 1.8×10^{20} e/cm^2), on which thermal conductivity measurements had been made before, showed within experimental error no scattering of amorphous regions, no lattice parameter change and no diffuse scattering intensity close to Bragg peaks. In contrast to similar earlier measurements on neutron-irradiated quartz single crystals, the results of thermal conductivity cannot be explained by amorphous regions distorting the lattice. (9 refs.)

66966 The crystal structure of erbium pentaphosphate. Lin Yonghua, Hu Ninghai, Zhou Qinglian, Shi Endong, Wang Mingyi, Liu Shuzhen, Wu Shixue (Changchun Inst. of Appl. Chem., Acad. Sinica, Beijing, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1182-5 (Nov. 1982). [received: April 1983] (3 refs.)

66967 Static and structural properties of III-V zincblende semiconductors. S.Froyen, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.561-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The pseudopotential method within the local density approximation is used to investigate the static and structural properties of some III-V zincblende semiconductors. The results for lattice constants and bulk moduli agree within a few percent with experimental values. Comparisons of calculated total energies as a function of volume and structure yield information about solid-solid structural phase transformations. At high pressures, the results indicate that metallic rocksalt and β-Sn structures have lower energy than zincblende. Other structures (e.g., CsCl and NiAs) are also investigated. (10 refs.)

66968 Structure of α- and β-Si_3N_4 observed by 1 MV electron microscopy. K.Hiraga, K.Tsuno, D.Shindo, M.Hirabayashi, S.Hayashi, T.Hirai (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Philos. Mag. A (GB), vol.47, no.4, p.483-96 (April 1983).
Crystal structures of Si_3N_4 prepared by chemical vapour deposition (CVD) have been observed on the atomic scale by high-voltage, high-resolution electron microscopy. Many-beam images with [001] axial illumination exhibit the projected potential with trigonal and hexagonal symmetry for α- and β-Si_3N_4 respectively at thicknesses of less than about 10 nm. The image contrasts are discussed on the basis of multislice calculations as a function of crystal thickness and objective lens defocus. Excellent agreement is obtained between the observed and calculated images for both crystals. An atomic model of a structure defect in β-Si_3N_4 is proposed directly from the images. (14 refs.)

66969 Charge distribution from least-energy structure in Ca-Mg orthosilicates. M.Catti (Cattedra di Cristallochimica, Univ. di Milano, Milano, Italy), G.Ivaldi.
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.160-6 (1983).
Calcium-olivine, γ-Ca_2SiO_4, larnite, β-Ca_2SiO_4, merwinite, $Ca_3Mg(SiO_4)_2$, and monticellite, $CaMgSiO_4$, are considered. According to a rigid oxyanion scheme, eulerian orientation angles of the SiO_4 tetrahedra and translation coordinates of Ca and Si atoms are specified as structural variables τ_k. All derivatives of the static energy (Born model) contain atomic charges and repulsive parameters as unknowns; the minimum energy conditions $\partial E_L/\partial\tau_k=0$ yield 34 equations which are solved by a least-squares method. The set of energy parameters fitting structural properties of all four phases together is: $z_{Ca}=1.50$, $z_0=-1.10$ e, $r_{Ca}=1.05$, $\rho=0.25$ Å; the Mg charge was fixed at 1.38 e, from a previous study on forsterite. An average shift of 0.04 Å is observed between experimental and least-energy calculated atomic positions. Results are compared with those of Mg_2SiO_4, where the fit was based both on thermoelastic and on structural properties. If no charge values were fixed 'a priori', ratios between charges could be determined by fitting them to structural data only. (17 refs.)

66970 Composition dependence of the lattice constant of $Ge_{2x}(GaAs)_{1-x}$ solid solutions. M.E.Raikh, V.E.Umanskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1298-300 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2011-14 (Nov. 1982). [received: April 1983]
The anomalous composition dependence of the lattice constant of $Ge_{2x}(GaAs)_{1-x}$ solid solutions is explained on the assumption that GaAs represents 'charged' Ge. (8 refs.)

66971 The effect of magnesium content on the structure and properties of synthetic smectites. J.Masar, V.S.Fajnor (Dept. of Inorganic Chem., Comenius Univ., Bratislava, Czechoslovakia).
Silikaty (Czechoslovakia), vol.27, no.1, p.45-53 (1983). In Czech.
Hydrothermal synthesis (temperature 300°C, pressure 8.8 MPa, time 6 days) was used for preparing 6 specimens from mixtures of X-ray-amorphous oxides in weight ratios $SiO_2:Al_2O_3:MgO=8:2:M$, where $M=1$, 2, 3, 4, 5 and 6 mole. Measurements of X-ray diffractions from planes 060 and the courses of DTG curves in the temperature interval 500-1000°C indicated that on increasing the MgO content, the dioctahedral smectite is supplemented with a gradually increasing proportion of smectite with a trioctahedral arrangement of structure. At a relatively high MgO content (about 25%), hydrothermal synthesis yeilds trioctahedral smectite. An increase in MgO content in dioctahedral specimens leads to gradual substitution of aluminium at the octahedron centres by magnesium, which results in an increase in the d_{060} value and an increase in the cation exchange capacity. However, the temperature of the dehydroxylation peak on both DTA and DTG curves remains in the interval 700-750°C. Dehydroxylation of synthetic trioctahedral smectics is terminated in the relatively narrow temperature interval of 850-900°C. An increase in the MgO content leads to a decrease of the melting temperature of the specimens in question. (6 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

66972 Molecular and crystal structure of ANCAOLAN (crystal I and crystal II). Lin Xio-Yun, Zhang Shu-De (Inst. of Biophys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.273-9 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
ANCAOLAN is a weed kiler, its series product, the crystal I($C_{11}H_{16}N_2O_4$ PSCL) and crystal II($C_{12}H_{19}N_2O_4$ PS), both belong the monoclinic system, with space group $P2_1/c$. There are four molecules in a unit cell. The crystal paramters are: crystal I $a=8.575$ Å, $b=26.541$ Å, $c=7.063$ Å, $\beta=94.744°$; crystal II $a=8.575$ Å, $b=26.538$ Å, $c=7.073$ Å, $\beta=93.819°$. For the crystals I and II the three-dimensional intensity data were collected by using PW-1100 four-circle diffractometer and the numbers of independent diffractions are 3123 and 3166 respectively. Their structures were solved by direct method and refined by full matrix least-squares method. Their final R-factors are 0.10 and 0.11 respectively. The plane of nitro is perpendicular to the plane of

benzene ring. The weed killing effect of crystal II is better than that of the crystal I. (2 refs.)

66973 Determination of crystal structure of α-chloro-n-sec-butyl-cinnamide. Zheng Chao-De, Gu Yuan-Xin (Inst. of Phys., Acad. of Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.280-4 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
α-chloro-n-sec-butyl-cinnamide crystal (trans) belongs to orthorhombic system. The space group is $D_{2h}{}^{15}$-P_{bca} with either molecules in a cell of dimension a=18.842 (0.006) Å, b=14.076 (0.006) Å, c=10.077 (0.003) Å. The intensity data were collected on RAA-IIS four-circle diffractometer. The number of independent reflexions is 929. The structure was solved by direct method (MULTAN=90). Refinement of structuré parameters was achieved by block-matrix least-squares method R=0.088. (no refs.)

66974 Lattice parameters, thermal expansion coefficients and density of vacancies in solid CH_4. A.I.Prokhvatilov, A.P.Isakina.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.419-28 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The lattice parameters and thermal expansion are X-ray investigated on polycrystalline methane. The volume jumps occurring during the phase transition and melting are estimated. Using the obtained thermal expansion coefficients, heat capacities C_V and Gruneisen constants are calculated. The contributions to heat capacity of translational and rotational motion of molecules are analysed. The density, volume and enthalpy of the equilibrium vacancy formation are found through a comparison of X-ray and dilatometric thermal expansion coefficients in the vicinity of the melting temperatures of CH_4. The characteristics obtained are close to the values observed for monovacancies in inert gas crystals. (35 refs.)

66975 1,2-dibenzyl- and 1,2-diaryltetrakis(dimethylamido)dimolybdenum and -ditungsten compounds: $M_2R_2(NMe_2)_4$ (M≡M). Structural effects of Me_2N-to-M π bonding. M.J.Chetcuti, M.H.Chisholm, K.Folting, D.A.Haitko, J.C.Huffman, J.Janos (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1163-70 (9 March 1983).
The authors have synthesised 1,2-$M_2R_2(NMe_2)_4$ compounds where R=benzyl and aryl. The conformations and other structural aspects of these new compounds provided unequivocal evidence for the dominant role of Me_2N-to-M π bonding in these types of complexes. (22 refs.)

66976 X-ray investigation of the high temperature structure of $(CH_3)_3NHCdCl_3$. S.Kashida, K.Sano, T.Fukumoto, H.Kaga (Dept. of Phys., Niigata Univ., Niigata, Japan), M.Mori.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1255-60 (April 1983).
The structural phase transitions in a linear chain compound $(CH_3)_3NHCdCl_3$ were investigated by an X-ray photographic method. It was found that the high temperature phase above 374K belongs to the orthorhombic Pbnm (Z=8) rather than to the hexagonal $P6_3/m$ (Z=6) which was proposed by Chapuis and Zuniga. The structure of this high temperature phase was argued to be characterized by an orientationally disordered state of the trimethyl ammonium ions. An analogy to the triangular Ising lattice is also refered.

66977 Tentative reconstitution of the crystal structure of benzene, at −3°C, by a molecular interaction analysis taking thermal vibration coefficients into account. B.Rerat, C.Rerat (Lab. de Cristallographie, CNRS, Bellevue, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.2, p.183-9 (Feb. 1983). In French.
The work follows a previous study which had permitted a theoretical reconstitution of the approximate crystalline structure of benzene, at −3°C, by a classical dynamic analysis of molecular interactions. By a refinement of the initial model, it also became possible to calculate the thermal anisotropic vibration coefficients. The new atomic positions are not in better agreement with those obtained by X-ray diffraction; a more systematic exploration of the possibilities of the method is thus-implied. (12 refs.)

66978 Structure of anions and neutral molecules of selenazolidine-2,4-dione. I.V.Levshin, M.M.Kaganskii, K.A.V'yunov, A.A.Tsurkan, A.I.Ginak, A.A.Espenbetov, A.I.Yanovskii, Yu.T.Struchkov.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.813-16 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.103-7 (July 1982). [received: March 1983]
The individual bands in the IR spectra of selenazolidine were interpreted by using the spectrum of d_3-selenazolidine-2,4-dione (III), and also the data on X-ray diffraction analysis of selenazolidine-2,4-dione (I). The IR spectra were recorded on the Perkin-Elmer 283 spectrophotometer. The solid samples were prepared in the form of suspensions in mineral oil. The spectra of the solutions were measured in CaF_2 cuvettes at a concentration of C=0.01 mole/liter. The cell parameters and intensities of 750 independent reflections with $F^2 \geq 3\sigma$ were measured on an automatic Hiller-Watts 4-disk diffractometer. (14 refs.)

66979 A mechanism of void growth in the region of the plastic zone ahead of a crack-tip. K.Jagannadham (Dept. of Engng. Sci. & Mech., Tennessee Technol. Univ., Cookeville, TN, USA).
Int. J. Fract. (Netherlands), vol.22, no.1, p.41-63 (May 1983).
A detailed dislocation model of the mechanism of void growth is illustrated using both the discrete dislocation analysis and the continuous distribution method. The latter is particularly developed to provide the scaling methods, so that the results can be readily obtained for different sizes of the crack and the void as well as for different positions of the void with respect to the crack. Application of these results to void growth in the region of the plastic zone ahead of a crack tip subjected to alternating stresses and creep is also suggested. (37 refs.)

(exc. colour centres)

66982 Huang-scattering from self interstitials in electron-irradiated Fe-40 at.% Al ordered alloy. J.P.Guillot, J.P.Rivere, M.F.Beaufort-Richard (Lab. de Metall. Phys., CNRS, Poitiers, France).
J. Phys. (France), vol.44, no.5, p.651-8 (May 1983).
A single crystal of Fe-40 at.% Al ordered alloy has been irradiated with 2.5 MeV electrons at liquid hydrogen temperature, and diffuse X-ray scattering (MoKα_1) near Bragg reflections has been studied after annealing the sample up to 300K. The characteristic diffuse scattering from point defects with weak displacement fields (Huang diffusion) has been observed near the (200) Bragg reflection in the directions [011] and [100] and near the (110) reflection in the directions [110] and [110]. This Huang scattering has been attributed to self interstitials since under the same irradiation conditions, electrical resistivity measurements indicate that the long range migration of self interstitials by annihilation at vacancies would occur only for temperatures higher than 300K. The comparison of the experimental results with the different simple interstitial configurations proposed for b.c.c. crystals suggests that the most probable configuration should be the [110] split interstitial with orthorhombic symmetry. (27 refs.)

66983 Self-interstitial atoms, vacancies and their agglomerates in electron-irradiated nickel investigated by diffuse scattering of X-rays. O.Bender, P.Ehrhart (Inst. fur Festkorperforschung KFA, Julich, Julich, Germany).
J. Phys. F (GB), vol.13, no.5, p.911-28 (May 1983).
Frenkel defects of concentrations varying between 200 and 600 PPM were produced in single crystals of Ni by irradiation with 3 MeV electrons at 4.5K. These radiation-induced defects and their reactions during thermal annealing were investigated by measuring the Huang diffuse scattering of X-rays, the change of the lattice parameter and the electrical resistivity. At 6K the authors observed statistically distributed Frenkel pairs. The configuration of the self-insterstitial atoms (SIA) agrees with the (100) split configurations. The relaxation volume of the SIA was determined to be 1.8 (±0.2) atomic volumes and the Frenkel defect resistivity was ρ_F=7.1(±0.8) μΩ cm at.%$^{-1}$. This set of values implies a relaxation volume for the vacancy of −0.22 atomic volumes. The annealing behaviour of Ni is characterised by interstitial motion during stage I and growth of interstitial type clusters during stage II that eventually form dislocation loops on {111} planes. Impurities of Si (undersized) and Al (oversized) in concentrations comparable to the concentration of the Frenkel defects cannot effectively suppress the cluster growth. Vacancy agglomeration has been observed directly after annealing in stage III. The additional diffuse scattering from the vacancy agglomerates can be distinguished from the scattering from interstitial type loops by its different asymmetry relative to the Bragg reflections. There is a simultaneous decrease of ρ_F with the formation of the vacancy agglomerates. All of these reactions are similar to those in Cu although the growth of the interstitial clusters is retarded for Ni. (37 refs.)

66984 A stochastic theory for clustering of quenched-in vacancies. V. Temperature dependence of cluster density. G.Ananthakrishna (Materials Sci. Lab., Reactor Res. Centre, Kalpakkam, India).
Pramana (India), vol.19, no.6, p.633-43 (Dec. 1982). [received: April 1983]
For pt.IV see ibid., vol.12, no.6, p.581-91 (1979). It is known that the density of vacancy loops in quenched aluminium and stacking fault tetrahedra in quenched gold show a saturation for low ageing temperatures. The physical mechanism leading to this effect is not well understood. The author considers a simple model which allows one to obtain the temperature dependence of total density. The analysis shows that the plateau region arises due to the fact that the number of absorption sites of a cluster is larger than the number of emission sites. The temperature dependence of the average number of vacancies in a cluster and the single vacancy concentration in equilibrium with the clusters are discussed. (10 refs.)

66985 Vacancy defects in GaAs:Sn. E.A.Skoryatina, M.N.Kolotov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1341-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2076-7 (Nov. 1982). [received: April 1983]
Investigates nonstoichiometry defects introduced by heat treatment. Variation of the arsenic vapor pressure could be used to create a predominance of defects in one of the GaAs sublattices. Heat treatments (annealing) were applied to n-type GaAs crystals grown by the Czochralski method and doped with tin ($n=5\times10^{17}$ cm^{-3}). A study of the photoluminescence spectra of GaAs:Sn indicated that changes occurred only in the surface layer and these were due to the annealing. (6 refs.)

61.70D Colour centres

66986 Hole-burning Stark spectroscopy of the 5770 Å colour centre in NaF. R.T.Harley, R.M.Macfarlane (IBM Res. Lab., San Jose, CA, USA).
J. Phys. C (GB), vol.16, no.12, p.L395-9 (30 April 1983).
Laser-induced spectral hole burning in the presence of applied electric and magnetic fields has been used to determine the symmetry and electronic character of the colour centre in X-irradiated NaF whose zero-phonon line is at 5770 Å. The centre is found to have C_s symmetry, perturbed only slightly from trigonal. The authors speculate that it, and other centres in this special region, may arise from F_3^+ centres perturbed by structural or chemical defects. (10 refs.)

66987 The optical absorption of F and F_H centres in cesium halides. C.K.Ong, J.Adetunji (Dept. of Phys., Nat. Univ. of Singapore, Lower Kent Ridge, Singapore).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K19-21 (1 March 1983).
The authors have employed the approximate pseudopotential of Bartram et al. (1968) and four parameter trial wave functions to investigate the optical absorption energy of F_H centres in cesium halides. (6 refs.)

66988 Effect of Z_1 centres on the isothermal stability of colour centres in microcrystalline powder of KCl. R.B.Pode, D.G.Wakde, B.T.Deshmukh (Dept. of Phys., Nagpur Univ., Nagpur, India).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K39-42 (1 March 1983).
The authors report on the role of alkaline earth impurities (Ca^{2+}, Sr^{2+}, Ba^{2+}) in KCl on the stabilisation of the colouration in this crystal. The crystals were crushed to a powder and exposed to γ-ray irradiation. Measurements were made of the thermoluminescence glow curves with the view of obtaining additional information about the interaction between colour centres and dislocations. (7 refs.)

Sov. Phys. J. (USA), vol.25, no.8, p.695-8 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.17-21 (Aug. 1982). [received: April 1983]
The authors study the production of X_3^- color centers in KBr crystals by nanosecond pulsed optical spectroscopy, which allows investigation of the primary stages of formation of this defect. To distinguish the formation of X_3^- centers on radiation-induced cation vacancies they use material with a low level of contamination by impurities of other valence. (11 refs.)

61.70G Dislocations: theory

66990 The elastic field of a Volterra dislocation in a planar phase boundary. R.Bonnet (Inst. Nat. Polytech. de Grenoble, Domaine Univ., Saint Martin d'Heres, France).
Philos. Mag. A (GB), vol.47, no.4, p.529-36 (April 1983).
The displacement field of an infinitesimal phase boundary dislocation (PBD) loop is first determined from results obtained by Rongved (1955) on the elastic effect of a point force in a two-phase medium. The displacement field of any PBD loop can be derived from a line integral obtained by summing all the contributions of a convenient set of infinitesimal rectangular loops. Explicit expressions are given for the displacement fields of a PBD jog, a semi-infinite PBD dipole and a rectangular PBD loop. (7 refs.)

66991 Point defects and effective activation parameters for motion of dislocations in Ge and Si at low stresses. G.A.Malygin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1561-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2757-62 (Sept. 1982). [received: April 1983]
It is shown that, including the kinetics of segregation of point defects on dislocations eliminates, the disagreement between the experimentally obtained activation parameters for motion of dislocations in Ge and Si and their values derived from the model of the displacement of dislocations along a Peierls relief in the presence of weak barriers on dislocations to the displacement of kinks. (22 refs.)

66992 Interaction of dislocations and deformation hardening of the ordered CuAu alloy. K.I.Zlodeeva, L.E.Popov, N.A.En'shina, V.S.Kobytev (Civil-Engng. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.698-702 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.21-6 (Aug. 1982). [received: April 1983]
The critical configurations of combinations of various types of dislocations in ordered alloys with Ll_0 superstructure are analyzed numerically. The characteristics of the dislocation combinations, as well as the partial resistance to motion of dislocations, owing to interaction of dislocations, are calculated for polycrystals and single crystals with different orientations of the ordered alloy CuAu. (22 refs.)

66993 Resistance to expansion of dislocation loop in FCC metal. R.I.Kurinnaya, L.V.Ganzya, L.E.Popov (Civil-Engng. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.710-13 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.35-8 (Aug. 1982). [received: April 1983]
The authors calculate the strength of dislocation compounds in FCC metals for dislocations of different orientation relative to the Burgers vector. A study is made of the dependence of the coefficient α_r, which characterizes the contribution of the reactive component of a dislocation forest to the flow stress, and the probability β_r of formation of dislocation compounds on the angle ψ_{II} of orientation of glissile dislocations. 66994 Recombination enhanced dislocation glide in InP single crystals. K.Maeda, S.Takeuchi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Appl. Phys. Lett. (USA), vol.42, no.8, p.664-6 (15 April 1983).
The glide mobility of dislocations in bulk *n*-type InP single crystals was measured by the double-etching method as a function of temperatures with or without 30-keV electron beam irradiation. The mobility of β dislocations was found to be enhanced by the irradiation in such a manner that the mobility increase is caused by a decrease in the apparent activation energy, which is characteristic of recombination enhanced defect reaction phenomena. The enhancement is not much different in its magnitude from the same type of dislocations in GaAs. (16 refs.)

66995 Dislocation etching of tin iodide single crystals. C.C.Desai, J.L.Rai (Dept. of Phys., Sardar Patel Univ., Gujarat, India).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.355-9 (1983).
Single crystals of tin-iodide (SnI_2) have been grown using the controlled reaction between $SnCl_2$ and KI by a diffusion process in a gel medium. As grown (010) surfaces of the crystals have been optically studied. Characteristic etch pits have been observed on them. This suggests that SnI_2 crystals might go into dissolution in the acid-set gel. By successively etching (010) surfaces in a mixture of ammonia, acetic acid, and $CdCl_2$ solution, it is established that the pits indicate the site of dislocations in the crystals. This is further confirmed by comparing the etch patterns before and after chemically polishing (010) surfaces. The average dislocation density in the crystals have been evaluated and found to be 3.2×10^3 cm^{-2} and the implications are discussed. (7 refs.)

66996 On the estimation of X-ray extinction changes due to randomly distributed dislocations in crystals. P.Klimanek, K.-H.Hanisch (Section of Metall. & Materials Technol., Acad. of Mining, Freiberg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.361-5 (1983).
A procedure proposed by Ivanov, Klimanek and Skakov for the quantitative estimation of X-ray extinction in crystals containing randomly distributed dislocations is established without restriction concerning the defect density on the basis of stochastic geometry. The dependence of the extinction coefficient of a X-ray diffraction peak obtained in this way agrees very well with experimental observations. (23 refs.)

66997 Etch pits on bismuth cleavages in nitric acid-n-butyl alcohol mixtures. L.K.Maniar, B.S.Shah (Dept. of Phys., Saurashtra Univ., Rajkot, India).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.K43-4 (1983).
Bi crystals were cleaved in the conventional manner at liquid nitrogen temperatures. The etchant used was made up of AR grade fuming nitric acid and n-butyl alcohol. The composition of the etchant was one part of fuming nitric acid and five parts of n-butyl alcohol. The bismuth cleavages were etched for various times from minutes to hours. Well defined, hexagonal pits in crystallographic directions were obtained, which were produced at the site of dislocations. (5 refs.)

66998 Determination of the sense of Burgers vector by plane-wave X-ray topography. K.Ishida, Y.Kobayashi, H.Katoh, S.Takagi (Dept. of Phys., Faculty of Sci. & Technol., Science Univ. of Tokyo, Chiba, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L151-3 (March 1983).
Dislocation images of a Si single crystal are observed by three-crystal topography with (+, +, −) setting. The images change with the diffraction condition of the topograph. The image taken out of the exact Bragg condition is sharp and its position is slightly displaced due to the strain induced around the dislocation. The sense of the Burgers vector is determined by the relation between the direction of the displacement and the diffraction condition of the topograph. (7 refs.)

66999 Dislocation etch pits & identification of slip systems in potassium perchlorate crystals. V.P.Bhatt, R.M.Patel, C.F.Desai (Dept. of Phys., Faculty of Sci., MS University of Baroda, Baroda, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.990-1 (Dec. 1982). [received: April 1983]
New chemical etchants capable of revealing dislocations intersecting (001) and (110) planes in $KClO_4$ crystals are reported. In addition to the known cleavage plane (001), another cleavage along (110) is found to exist in this crystal. The slip systems operative in this type of crystals are reported for the first time. (4 refs.)

67000 Resolution of dislocation lines in germanium by etching. E.B.Gorokhov (Inst. of Semiconductor Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.741-3 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.885-7 (June 1982). [received: Feb. 1983]
An etching reagent composition is proposed for resolving dislocation lines on germanium. The referred technique of resolution of the said type of dislocations has certain advantages over such known techniques as X-ray topography or plasma etching because of its simplicity, high efficiency, and high resolving power. Low etching rate makes it possible to investigate dislocation structures in thin surface-adjoining layers of germanium. (5 refs.)

67001 On the point and line defects which are common to both degraded light emitting diodes and plastically deformed GaAs. Z.Liliental (Center for Solid State Sci., Arizona State Univ., Tempe, AZ, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2097-102 (April 1983).
Similar dipoles with Burger's vector $\mathbf{b}=\mathbf{a}/2$ [101] (also referred to as dark line defects) were found in the active layer of degraded light emitting diodes (LEDs) and in plastically deformed GaAs. The dependence of characteristic X-ray production of electron channeling conditions has been used in an electron microscope to study point defects in the neighborhood of these dipoles. The results are consistent with the occurrence of I_{As}, $I_{As}+V_{Ga}$ and I_{GaAs} in descending order of likelihood. Of these, $I_{As}+V_{Ga}$ can explain the dislocation climb without any extra point defects involved in such process. (24 refs.)

67002 In situ X-ray topographic study of the dislocation mobility in high-purity and impurity-doped silicon crystals. M.Imai, K.Sumino (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Philos. Mag. A (GB), vol.47, no.4, p.599-621 (April 1983).
An in situ X-ray topographic technique using a high-power X-ray generator has been used to study the dislocation mobility at elevated temperatures in the stress range 1.2-40 MN m^{-2} for pure and impurity-doped silicon crystals. The variation of velocity with stress for both 60° and screw dislocations in high-purity crystal is linear throughout the whole stress range investigated, the activation energies for motion being independent of stress. No previously published theoretical models are able to account for the measured velocities quantitatively. Effects of impurities, such as oxygen, carbon, nitrogen, phosphorus and boron, are investigated in detail. Generally, the impurities bring about a deviation from linearity of the variation of velocity with stress under low stresses. Dislocations originally moving in impure crystals are immobilized when the stress becomes lower than a critical value. These phenomena are interpreted in terms of the development of an impurity atmosphere around slowly moving dislocations. Phosphorus atoms are known to enhance the dislocation motion under high stresses and to retard it under low stresses. (40 refs.)

67003 Influence of the medium on the distribution of dislocations near a surface parallel to the Burgers vector in deformed LiF crystals. O.A.Klyavin, G.I.Shvets (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1526-8 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2692-6 (Sept. 1982). [received: April 1983]
The density of dislocations in screw slip bands was shown to decrease near the outer surface parallel to the Burgers vector in LiF crystals deformed in vacuum at 4.2K. Decrease in dislocation density extends to a distance up to 25 μ. No such decrease occurs near the aforementioned surface when the crystal is deformed in a medium of liquid helium. The results obtained are discussed in terms of dislocation-dynamic diffusion, i.e. penetration of impurity atoms of the ambient medium into the crystal lattice along moving dislocations. (15 refs.)

61.70L Slip, creep, internal friction and other indirect evidence of dislocations

(see also 62.20H Creep, 62.40 Internal friction)

67004 The influence of internal stress fields on the velocity of dislocations in BCC crystals. M.Anglada (Dept. de Ciencia de los Materiales, Univ. Simon Bolivar, Caracas, Venezuela).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.239-44 (April 1983).
The dislocation dynamics in the presence of a periodic internal stress field $\tau_i(x)$ was analysed in b.c.c. crystals by using the velocity-stress relationship which results from the nucleation of kink pairs on the screw dislocation at temperatures near the 'knee' temperature. It is shown that, for stresses much greater than the amplitude τ_0 of $\tau_i(x)$, the effective internal stress τ_μ is a constant equal to τ_0. For stresses close to τ_0, the effective internal stress depends on the applied stress. the implications of this with respect to the determination of the activation parameters for thermally activated dislocation glide are discussed and it is shown that, although the change in τ_μ has a very small effect on the determination of the activation energy for the short-range mechanism, the apparent activation area measured from experiments can be substantially greater than the true activation area. (17 refs.)

67005 Modelling intrinsic stresses by setting up Somigliana dislocations. M.N.Dveres, A.V.Fomin.
Mech. Solids (USA), vol.17, no.3, p.152-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.3, p.165-7 (1982).
Demonstrates that there is an analogy between problems of incompatible initial deformations and Somigliana dislocations. Intrinsic stresses are modelled by setting up Somigliana dislocations—slits, deformations, and splices. Deformation is performed on the basis of a particular solution of the corresponding problem of elasticity. It is shown that the method is applicable in cases in which the incompatibility tensor or dislocation-density tensor is known instead of the initial deformations. Unlike the method of elimination of deformations the method can be realized with models of incompressible material. (8 refs.)

67006 Transmission electron microscopic study of experimentally deformed K-feldspar single crystals. The (010)[001], (001)$^1/_2$[$\bar{1}$10], (110)$^1/_2$[$\bar{1}$12] and (1$\bar{1}$1)$^1/_2$[110] slip systems. E.Scandale, M.Gandais, C.Willaime (Lab. de Mineralogie Cristallographie, Univ. Pierre et Marie Curie, Paris, France).
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.182-7 (1983).
A set of sanidine single crystals were previously deformed at 700°C in a Griggs triaxial press with different crystallographic orientations of the core so as to induce dislocation glide of different slip systems respectively. Deformed crystals have been studied by transmission electron microscopy (TEM) and the activated slip systems have been characterized for two orientations. The (010)[001] and (001)$^1/_2$[$\bar{1}$10] systems expected for one orientation (main stress nearly parallel to [012]) are observed, whereas the (001)[100] system expected for the other orientation (main stress nearly parallel to [101]) is never observed. In the latter specimen the deformation is rather difficult and occurs through unexpected systems characterized as (110)$^1/_2$[$\bar{1}$12] and (1$\bar{1}$1)$^1/_2$[110]. In all the samples studied the deformation is heterogeneous, exhibiting dislocation configurations related to temperature variations. (5 refs.)

67007 Electron microscopy of antiphase domain boundary tubes in deformed ordered alloys. C.T.Chou, S.P.Hirsch (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.91-104 (8 May 1983).
Antiphase domain boundary (APB) tubes have been observed in a slightly deformed Fe-30.5 at.% Al alloy in dark field electron microscope images taken in superlattice reflexions. The image contrast theory has been developed and accounts satisfactorily for the nature of the APB tube contrast observed. The contrast theory is used to estimate the heights of the tubes. The widths of the tubes range from 20 to 50 Å, and the measured heights are in the range of one to six times the elementary height. Evidence is presented that tubes are generated by the Vidoz and Brown (1962) mechanism and by a mechanism of cross-slip and annihilation of screw superdislocations. The possible effects of tubes on flow stresses are discussed. (20 refs.)

67008 Structural width of low-angle grain boundaries in olivine. D.L.Ricoult, D.L.Kohlstedt (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.133-8 (1983).
Electron diffraction and imaging techniques have been used to examine the structure and thickness of low-angle grain boundaries in olivine. For edge-on grain boundaries, a periodic array of dislocations in a boundary gives rise to sets of periodic rods of diffracted intensity that are recorded as streaks in the diffraction pattern. The length of these streaks provides a measure of the structural width of a boundary. For olivine, the structural width of a boundary with a given dislocation spacing is three to four times smaller than that in metals where the boundary width is approximately equal to the spacing between dislocations in the boundary. (24 refs.)

67009 Segregation of solute atoms at dislocations in low-angle grain boundaries. A.Greenberg, Y.Komem (Dept. of Materials Engng., Technion-Israel Inst. of Technol., Haifa, Israel), C.L.Bauer.
Scr. Metall. (USA), vol.17, no.3, p.405-10 (March 1983).
Bicrystalline thin films of gold, containing 4 and 16° [001] tilt boundaries, have been implanted at room temperature with cobalt, chromium, lead and gold at an energy of 40 keV and integrated fluxes ranging from 1 to 100×10^{13} ion/cm^2 and subsequently examined by transmission electron microscopy. It was observed that the discrete strain-contrast pattern associated with individual dislocations in low-angle boundaries is obliterated by implantation with cobalt or chromium, but not by implantation with lead or self-implantation with gold at integrated fluxes ranging from 1 to 10×10^{13} ion/cm^2. It is concluded that cobalt and chromium segregate at grain boundaries, thereby distorting the lattice and obliterating the discrete strain-contrast pattern, whereas lead, being totally immiscible in gold, segregation at free surfaces. This interpretation is consistent with a model wherein the width of dislocation cores is dependent on the gradient of grain boundary energy as a function of misorientation angle. These results suggest that segregation of impurities at low-angle grain boundaries alters grain boundary structure in much the same manner that adsorption of impurities alters surface structure. (10 refs.)

67010 A new structural representation of symmetric tilt boundaries in the [001] direction in FCC lattices. E.A.Bukin, A.N.Orlov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1321-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2146-9 (Nov. 1982). [received: May 1983]
Ashby et al. (1978), Smith et al. (1977) and Frost et al. (1980) used graphic methods and computer simulation to determine the atomic structure of a number of symmetric special tilt boundaries relative to the ⟨001⟩ axis in FFC crystals. It was shown that these boundaries are made up of (somewhat distorted) Bernal polyhedra—extended triangular prisms and pentagonal bipyramids. These polyhedra form chains parallel to the axis of revolution in which the extended triangular prisms abut at their end faces and the pentagonal bipyramids are arranged vertex-to-vertex. In an ordinary boundary with misorientation angle θ lying between the two 'special' values ${\theta_i}^0$ and ${\theta_{i+1}}^0$ the stuctural elements of the boundary characterized by the angles ${\theta_i}^0$ and ${\theta_{i+1}}^0$ are present in different proportions. The present authors demonstrate that these structural elements can be regarded as combinations of very simple polyhedra, viz. distorted tetrahedra (T) and octahedra (O) (this is called the OT-representation). Undistorted tetrahedra and octahedra are the structural elements in perfect FCC and close-packed cubic lattices. The authors also show that the arrangement of atoms in one of the planes perpendicular to the rotation axis can be used to deduce the atomic structure of the entire bicrystal. (5 refs.)

67011 Comparison between natural and synthetic grain boundaries by means of discontinuous precipitation. W.Gust, S.Stiltz, B.Predel (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Z. Metallkd. (Germany), vol.74, no.4, p.206-11 (April 1983). In German.
The growth kinetics of the discontinuous precipitation have been investigated in tetracrystals of the Cu-4 at.% Ag alloy. The tetracrystals possess, at the same time, two natural random grain boundaries as well as a synthetic one with the same geometry. The tetracrystals permitted a direct comparison of both types of grain boundaries under otherwise identical conditions. The measurements of the growth velocity and of the particle spacing have been carried out separately for the individual grain boundaries. The comparison of the experimentally determined grain boundary diffusivities and the findings which are present in the literature, are indicating the same behaviour and, herewith, the same structure of natural as well as of synthetic grain boundaries. 61.70P Stacking faults, stacking fault tetrahedra and other planar or extended defects

67012 Analysis of high-voltage, high-resolution images of lattice defects in experimentally-deformed dolomite. D.J.Barber (Phys. Dept., Univ. of Essex, Colchester, England), L.A.Freeman, D.J.Smith.
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.102-8 (1983).
Deformation-induced stacking defects in dolomite have been characterised following examination at the cation sublattice level using high-resolution electron microscopy at 500 kV. Slip on c ($\equiv\{0001\}$) is observed to produce stacking faults, often delocalised laterally, which are terminated by partial dislocations with Burgers vectors of the form 1/3 $[1\bar{1}00]$; a model for the faulted dolomite lattice has been constructed which agrees with the image appearance. Slip on f ($\equiv\{10\bar{1}2\}$) produces long planar faults which are established as not being stacking faults, in the normal sense, since there appear to be no offsets of the cation sublattice across the faults, nor any general indication of any terminating partial dislocations; it is proposed that the contrast arises from rotational disorder in CO_3 groups which has resulted from the prior passage of partial dislocations during deformation. 67014 Characterization of disordered bonds in Si-implanted $Ga_{0.47}In_{0.53}As$ with laser Raman spectroscopy. K.Kakimoto, T.Katoda (Inst. of Interdisciplinary Res., Univ. of Tokyo, Tokyo, Japan).
Appl. Phys. Lett. (USA), vol.42, no.9, p.811-13 (1 May 1983).
Difference in degree of disorder introduced by ion implantation into In-As and Ga-As bonds in $Ga_{0.47}In_{0.53}As$ was studied with laser Raman spectroscopy. The disorder is introduced more easily into the In-As bond than into the Ga-As one. The disorder is removed simultaneously from both bonds with annealing at a temperature higher than 600°C. (11 refs.)

67015 Summary of the Fourth International Conference on ion implantation: equipment and techniques. H.Glawischnig (Siemens AG, Munich, Germany), H.Ryssel, C.McKenna.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1693-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
On September 13-17, 1982, the Fourth International Conference on Ion Implantation: Equipment and Techniques, was held in Berchtesgaden, Germany. Seventy-seven invited and contributed papers in the fields of ion-implantation equipment (ion sources, high-current implanters for metals and semiconductors, beam scanners, wafer cooling, wafer transport, etc.), equipment testing (dosimetry, voltage calibration, etc.), special measuring techniques for implanted layers, as well as applications of ion implantation to semiconductors and metals, were presented. In addition, a school on problems concerning the use of ion implantation was held. This paper summarizes the various presentations. (2 refs.)

67016 MeV ion implantation systems for production processing of silicon wafers. G.A.Norton, G.M.Klody (Nat. Electrostatics Corp., Middleton, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1701-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A 3 MeV boron implantation system is presently undergoing final beam tests prior to shipment. This is a 1.2 MV tandem Pellertron based system capable of automatically processing 20 wafers per hour at a dose of 10^{13} ions/cm^2 for 100 mm wafers using a serial, cassette to cassette, wafer handler. This system is equipped with a reliable negative ion cesium sputter source and electrostatic beam, scanning after 90° magnetic energy analysis. With the exception of the wafer handler and some vacuum valves, the entire vacuum system including the ion beam accelerating tube is all metal and ceramic. The vacuum system is automated. A microprocessor provides for data logging into a customer supplied computer. A single ended 3 MV Pelletron based implanter has also been designed for high dose, rapid throughput implantation of 3 MeV singly charged ions. Both systems, accomodate 100 mm and 125 mm diameter wafers. Both systems are designed for high reliability, minimum down time and simple maintenance. (2 refs.)

67017 Progress in ion beam mixing. S.Matteson (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1705-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Ion Beam Mixing is a rapidly progressing scientific field marrying material science and ion physics. Technological applications are presently under exploration even though the phenomenological processes are not fully understood. The present work examines the experimental data which provide an understanding of the underlying processes occuring during ion beam mixing. Experimental results of ion beam mixing of thin evaporated Sn layers in mixed Ge/Si solid solutions are reported. Tentative conclusions are drawn as to the likely directions for fruitful avenues of investigation. (16 refs.)

67018 Ion implantation into GaAs for microwave device applications. W.M.Paulson (Semiconductor Res. & Dev. Lab., Motorola Semiconductor Product Sector, Phoenix, AZ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1713-17 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The direct implantation of dopants into semi-insulating GaAs materials provides the active layers for microwave transistors and high speed ICs. Background impurities and stoichiometric defects in the starting material influence the properties of the active layers. Silicon implants produce n-type layers with mobilities of 4600 cm^2/V-s and Be implants yield p-type layers with bulk mobilities. Higher dose silicon implants give reproducible contact resistivities below 10^{-6} ohm-cm^2. Oxygen implantation ensures device isolation and minimizes backgating effects on ICs. High frequency MESFETs and ICs have been fabricated utilizing the versatility of ion implantation. (34 refs.)

67019 Effects of low temperature annealing of $B^+ + Si^+$ or $BF_2{}^+ + Si^+$ implanted silicon. S.R.Wilson, R.B.Gregory, W.M.Paulson (Semiconductor Res. & Dev. Lab., Inc., Phoenix, AZ, USA), A.H.Hamdi, F.D.McDaniel.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1730-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Silicon wafers have been implanted with B^+ or $BF_2{}^+$ at two different energies. Some of the wafers were subsequently implanted with Si at room temperature or at LN_2 temperature to enhance the lattice damage. The wafers were annealed at temperatures ranging from 600°C to 900°C. The effects of the different implant energies and of the resulting lattice damage, dopant profiles and electrical properties are discussed. (6 refs.)

67020 Characterization of ion implanted silicon annealed with a graphite radiation source. S.R.Wilson, R.B.Gregory, W.M.Paulson, H.T.Diehl (Semiconductor Res. & Dev. Lab., Motorola Inc., Phoenix, AZ, USA), A.H.Hamdi, F.D.McDaniel.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1734-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A Varian IA-200 isothermal annealer has been used to anneal ion implantation damage and electrically activate dopants in As and B implanted silicon with minimal redistribution of the impurity. The anneal occurs in vacuum using infrared radiation from a resistively heated sheet of graphite. Good quality anneals of ^{11}B implanted samples have been obtained with minimal boron diffusion. Arsenic implanted wafers have also been annealed with excellent results except for a substantial loss of As which occurs unless the wafer has an SiO_2 cap. The anneal quality of (100) wafers was independent of dose, however, the anneal quality of the (111) wafers improved with increasing As dose. (22 refs.)

67021 In situ study of implantation-induced silicon amorphisation. M.O.Ruault, J.Chaumont, H.Bernas (Lab. Rene Bernas, CSNSM, Orsay, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1746-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The formation and evolution of radiation damage due to room temperature and 100K Bi ion implantation in Si at 50 keV and 200 keV was studied during implantation and annealing via in situ transmission electron microscopy (TEM) using the newly developed facility at Orsay. (15 refs.)

67022 Mass transfer of iron during doping of epitaxial layers of gallium arsenide. N.A.Chernov, N.N.Bakun, I.Sh.Akhunov, G.M.Ikonnikova.
Inorg. Mater. (USA), vol.18, no.5, p.730-2 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.870-1 (May 1982). [received: Feb. 1983]
One method for obtaining semiinsulating epitaxial layers of GaAs in gas-phase epitaxy is doping of a growing layer with iron, which forms deep acceptor levels in the forbidden zone of gallium arsenide. The authors investigated the transfer of iron by means of an H_2+HCl stream as a function of the flow rate and the temperature of the source. The investigations were carried out with an industrial apparatus designed for the preparation of epitaxial layers of GaAs by the chloride method. The studies of iron transfer made it possible to find the conditions for the introduction of iron into the gas phase and to obtain high-resistance epitaxial layers of gallium arsenide with a specific resistance of 10^5 to 10^7 Ω.m at a fine donor impurity concentration of $(2\text{-}3)\times10^{22}$ m^{-3}. (8 refs.)

67023 Study of ion-implanted damage in GaAs:Be and inP:Be using Raman scattering. C.S.Rama Rao, S.Sundaram (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA), R.L.Schmidt, J.Comas.
J. Appl. Phys. (USA), vol.54, no.4, p.1808-15 (April 1983).
The Raman spectra of GaAs and InP implanted with Be ions with fluences ranging from 5×10^{12} to 1×10^{16} cm^{-2} were investigated. A marked difference in the behaviour of the TO and LO modes with respect to broadening with fluence was observed and the results indicate that this is caused by frequency dependent anharmonic damping constants. The Raman spectra of high fluence samples were interpreted in terms of disorder-induced first-order Raman spectra due to phonons with nonzero wave vectors. The similarities between the authors' 'Reduced Raman Spectra' of the disordered form and a theoretical one-phonon density of states, are presented without introducing Gaussian broadening as suggested by earlier authors studying amorphous materials. The observations support the conclusion that the form essentially retains the short-range order of the crystalline phase; the phonon spectrum of the crystal is largely determined only by near-neighbor interactions; and the existence of a frequency-dependent coupling constant for the scattering intensity at least in the low frequency region. (39 refs.)

67024 Surface restoration of oxygen-implanted silicon. M.J.Kim, D.M.Brown, M.Garfinkel (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1991-9 (April 1983).
The effects of oxygen implantation and annealing conditions on surface crystal restoration were studied as a function of temperature, by means of infrared spectroscopy, ultraviolet reflectance, electron microscopy, and secondary ion mass spectroscopy analysis. The oxygen interstitial absorption band shifts from 1020 to 1100 cm^{-1} with annealing temperature, and the structure of the buried oxide changes with annealing condition. The restoration process is enhanced by defects formed during implantation. The binding energy of the oxygen-vacancy complex was found to be (0.48 ± 0.03) eV from kinetic analysis. Low-temperature implantation combined with a long-term single-stage annealing is found to be suitable for good surface restoration. (31 refs.)

67025 Effect of phosphorus doping on stress in silicon and polycrystalline silicon. S.P.Murarka, T.F.Retajczyk,Jr. (Bell Labs., Murray Hill, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2069-72 (April 1983).
An investigation of the polysilicon stress properties as a function of film thicknesses and phosphorus doping showed that as-deposited films are moderately compressive, and become less compressive with increasing film thickness. High temperature PBr_3 diffusion in silicon produces wafer bending corresponding to a tensile stress in wafer. Following a PBr_3 diffusion, polysilicon films, however, become less compressive. Subsequent oxidation introduces an additional compressive stress component in the order of $2\text{-}3\times10^9$ dyne/cm^2 for oxidation temperatures between ~900-1000°C. The thermal expansion coefficients were similar for doped and undoped films ($\alpha\sim2.9$ ppm/°C) and slightly less than for ⟨100⟩ silicon, while the doped films were found to be less stiff than undoped ones but both were less stiff than ⟨100⟩ silicon. The observed changes in polysilicon stress due to film thickness and phosphorus doping have been interpreted in terms of a grain growth model wherein those factors which lead to enhanced grain growth also result in reduced compressive stresses. (19 refs.)

67026 Effective *p*-type doping of diamond by boron ion implantation. G.Braunstein, R.Kalish (Phys. Dept., Technion-Israel Inst. of Technol., Haifa, Israel).
J. Appl. Phys. (USA), vol.54, no.4, p.2106-8 (April 1983).
Highly conducting *p*-type diamond layers have been obtained by high-dose boron implantation followed by annealing (1400°C) and subsequent removal of the graphite-like layer that is formed as a result of the heat treatment. Conductivity and Hall measurements showed transport features typical of heavily doped semiconductors. The fact that identical carbon implantations have yielded no measurable conductivity is taken as evidence that the highly conductive *p*-type layer obtained by boron implantation is indeed due to effective doping. (15 refs.)

67027 The different roles of nitrogen in RF-sputtered and RF glow discharge hydrogenated amorphous silicon. G.J.Smith, W.I.Milne (Engng. Dept., Univ. of Cambridge, Cambridge, England).
Philos. Mag. B (GB), vol.47, no.4, p.419-29 (April 1983).
The effect of nitrogen in hydrogenated amorphous silicon (a-Si:H) has been investigated using thin films produced by RF-sputtering and by RF glow discharge decomposition of silane. In RF-sputtered a-Si:H a donor action is observed and E_F may be moved to within 0.2 eV of E_c. In contrast, a large nitrogen content in glow discharge a-Si:H gives conductivity enhancement, but no doping effect. These results are discussed and compared with those from a-Si:H doped using other techniques. (20 refs.)

67028 Distribution of indium ions in indium substituted Mn-Zn ferrites. K.H.Rao (Phys. Dept., Andhra Univ., Waltair, India), R.G.Mendiratta.
J. Appl. Phys. (USA), vol.54, no.4, p.1795-9 (April 1983).
The variations in DC resistivity and Mossbauer line intensities for various dopant concentrations of indium in a manganese-zinc ferrite have been investigated to analyze the site occupancy of indium ions. The indium ions are observed to occupy both tetrahedral and octadral sites through the whole range of concentration studied. The picture proposed on the basis of resistivity measurements has been confirmed by Mossauer data. (12 refs.)

67029 Near-neighbor configuration and impurity-cluster size distribution in a Poisson ensemble of monovalent impurity atoms in semiconductors. U.F.Edgal, J.D.Wiley (Dept. of Electrical & Computer Engng., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4997-5006 (15 April 1983).
The authors present some microscopic (atomic scale) structure analysis for Poisson-distributed impurities in semiconductors. Relevant concepts and results, well established in the area of a geometrical probability, are employed in the analysis. Monte Carlo results for the distribution of 'impurity-cluster' sizes in semiconductor media approximated by their continuum representation are also presented. A closed-form expression for the 'impurity-doublet' probability and a general formulation for the impurity-cluster size distribution are also provided. (22 refs.)

61.70Y Interaction between different crystal structure defects

67030 Inner differentiation of growth sectors induced by the interaction between dislocations and sector boundaries in KH_2PO_4 crystals. C.Belouet (Labs. d'Electronique et de Phys. Appl., Limeil-Brevannes, France), E.Dunia, J.F.Petroff, M.Sauvage.
J. Cryst. Growth (Netherlands), vol.61, no.2, p.383-92 (March 1983).
Single crystals of KDP and DKDP give a strong electro-optical effect at temperatures close to their Curie point. This property is the basis for the use of DKDP as a solid-state light modulator for large-screen display devices. However, electrical conductivity heterogeneities in these crystals eventually impair the performances of the devices. The authors report on a remarkable differentiation in electricl conductivity in polyhedral-shaped regions which result from the interaction of a dislocation line with the boundary between pyramidal sectors. A close correlation is established between the lattice dilation and the electrical conductivity differentiation in these polyhedral regions as estimated by plane-wave X-ray topography and electroding decoration techniques. A phenomenological interpretation for both the genesis of the polyhedral defects and their physical properties is proposed. (14 refs.)

67031 Influence of the orientation of anisotropic impurity-vacancy complexes upon dislocation charging in NaCl crystals. E.L.Andronikashvili, M.V.Galustashvili (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.335-8 (1 March 1983).
Electrical effects are investigated observed during charged dislocation motion in NaCl crystals containing impurity-vacancy dipoles oriented in an electric field ($E=12$ kV/cm). It is shown that the efficiency of dislocation charging, i.e. vacancy absorption from the dipole by the dislocation, depends on the mutual orientation of the dipole and the moving dislocation. The data obtained can be explained within a model taking into account both the elastic dislocation-dipole interaction and the electrostatic interaction of the dipole components of opposite charges. (9 refs.)

67032 Vacancy-dislocation interaction energies in MgO. A re-analysis. M.P.Puls (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).
Philos. Mag. A (GB), vol.47, no.4, p.497-513 (April 1983).
Atomistic calculations of the energy of interaction of anion and cation vacancies with an $a/2[110](1\bar{1}0)$ edge dislocation in MgO have been carried out using the breathing-shell model. This is an extension of previous calculations (see ibid., vol.41, p.353, 1980, and J. Phys. (France), vol.42, p.13, 1981) carried out with the shell and point-ion models. Comparison of the results, obtained for a small number of defect locations around the dislocation's centre, shows only small differences among the models, indicating that for MgO the point-ion model is sufficiently accurate. A calculation of the volume of formation of Schottky defects in MgO carried out with the two shell models, using the volume derivative method, gives roughly comparable results. For Schottky defects, the relaxation volume varies from 0.36 to 0.52 molar volumes, which is close to the volume determined by Sangster and Rowell (1981), using a similar method of calculation but with a slightly different potential. An error in the program PDINT used to calculate interaction energies has been corrected, and previously published interaction energies, for an extended region surrounding the edge dislocation, have been re-evaluated. (17 refs.)

67033 Kinetics of hydrogen-monovacancy interactions in metals. R.B.McLellan (Dept. of Mech. Engng. & Materials Sci., William Marsh Rice Univ., Houston, TX, USA).
Scr. Metall. (USA), vol.17, no.3, p.417-20 (March 1983).
Presents a calculation of the diffusion coefficient of an interstitial species in a lattice containing monovacancies and shows how the corresponding predictions may be related to experimental measurements. The results are compatible with a simple defect trapping mechanism, but this conclusion is tentative due

to the uncertainty in the actual effects of neutron irradiation in Mo and the interesting discovery that the H-diffusivity is enhanced in Pt. (8 refs.)

61.80 RADIATION DAMAGE AND OTHER IRRADIATION EFFECTS

(for techniques of structure determination, see 61.10 to 61.16; for electron and ion impact phenomena, see 79.20)

67034 Radiation induced soft fails in space electronics. E.L.Petersen (Naval Res. Lab., Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1638-41 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Advanced microelectronic circuits are sensitive to the passage of single ionizing particles. These circuits store information so that the deposition of a small charge (picocoulomb range) can charge a storage node, resulting in a bit error. This effect presents a problem to computer memories, on Earth because alpha particles are emitted from microelectronic packages and materials. The problem is much more severe in space due to primary cosmic rays and to nuclear reactions in the device produced by protons from the Earth's radiation belts. A number of satellite systems have been severely affected by single event soft-fails. (10 refs.)

67035 Analysis of thermal stresses induced in silicon during xenon arc lamp flash annealing. G.G.Bentini, L.Correra (Inst. LAMEL-CNR, Bologna, Italy).
J. Appl. Phys. (USA), vol.54, no.4, p.2057-62 (April 1983).
Evaluation of thermal stresses induced on silicon wafers during flash annealing with incoherent light from a xenon lamp has been performed. The thermally induced stresses have been computed taking into account that the slip planes, in ⟨100⟩ silicon crystal, are {111} and the slip directions in the plane are ⟨110⟩. The computed stresses have been compared with the yield stress of the material, to determine the threshold of damage introduction by the annealing process. For the light flash durations shorter than 500 μsec, a preheating of the sample is necessary to obtain a good annealing of a 1000 Å implanted layer without defect introduction. A relationship between flash duration, preheating temperature and flash energy density has been established following the identification of the best annealing conditions. The computed results have been compared with experimental annealing data obtained on ⟨100⟩ silicon, phosphorus implanted at 10 keV, 1.5×10^{15} at/cm^2 and irradiated with an original flash annealing system set up in the authors' laboratory. (18 refs.)

67036 Low temperature irradiation of amorphous Fe-B alloys. A.Audouard (INSTN, CENS, Gif-sur-Yvette, France), J.C.Jousset.
J. Phys. Colloq. (France), vol.43, no.C-9, p.423-6 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Amorphous alloys $Fe_{80}B_{20}$, $Fe_{75}B_{25}$ and their crystallized counterpart Fe_3B have been irradiated at low temperature ($\sim$20K) with different particles. From the experimental results it can be assumed that irradiation induces the creation of localized point defects and disordering. For the most energic particles there is a competition at 30K between crystallization and amorphization. (5 refs.)

67037 The effect of UV irradiation on films made of PVC containing small amount of modifying copolymers. A.Kaminska (Inst. Chem., Univ. of Mikolaja Kopeknika, Torun, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.27, no.2, p.59-62 (Feb. 1982). In Polish. [received: March 1983]
The changes in physicochemical and mechanical properties caused by UV irradiation of a packaging film made of PVC with added copolymers of the type: VC-VAc, MBs and an acrylic resin (Paraloid) have been investigated. By evaluating the extent of changes in solubility, permeability and color it has been demonstrated that the presence of these copolymers in the film contributes to an increase in the UV-sensitivity of PVC. It has also been found that crosslinking of PVC results in a decrease of permeability, tensile strength and elongation at break of the film. The numerical values characterizing the two last-mentioned properties decrease rapidly after appearance of gel, whereas their maximum values are observed just before its appearance. Thus, at crosslinking density of PVC below 1 the effect of crosslinking on these properties is positive and at crosslinking density above 1—negative. (16 refs.)

67038 Two-component cascades of collisions. I.A.Akhiezer, Z.A.Spol'nik.
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1810-11 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3188-90 (Oct. 1982). [received: April 1983]
The authors generalise the simplified method developed by Akhiezer et al. (1975) to the case of a two-component cascade. They give some estimates for cascades in uranium dioxide UO_2. (7 refs.)

67039 Guide to the effects of nuclear irradiation on materials, electronic and electrical components, oils and greases. R.C.E.Lewis.
Report SRD R 249, UKAEA, Culcheth, Lancs., England (March 1983), 17 pp.
It is impossible in a short report to give details of the effects of irradiation on each component or material and there are some discrepancies in the threshold levels quoted in the literature. There is, however, general agreement regarding the level of radiation at which there is some change (usually deterioration) in the normally accepted performance. Where components are required to operate in the immediate vicinity of radiation fields of upwards of 10^5 Rads, the potentially damaging threshold levels are shown. It is concluded from a study of the information available that the specification for plant, and components in chemical plants which handle radioactive materials need be no different from other plants. 61.80B Laser beams

67040 Current-assisted laser annealing of polysilicon films. K.Okamoto, H.Suzunaga (Univ. of Electro-Communications, Tokyo, Japan).
Appl. Phys. Lett. (USA), vol.42, no.9, p.809-11 (1 May 1983).
The authors suggest the current-assisted laser annealing of polysilicon films deposited on SiO_2 by chemical vapor deposition of silane. A *Q*-switched ruby laser was irradiated to polysilicon films with applying an electric field. Then, a large photocurrent flowed through the films during the laser irradiation, and the resistivity of the polysilicon films decreased drastically from $\sim 10^8$ to $\sim 10^4$ Ω cm by the current-assisted laser annealing, while the resistivity decreased only to $\sim 10^6$ Ω cm in the case of the conventional laser annealing (zero electric field). The effects of the applied electric field on the annealing are due to the local heating at the grain boundaries and the promotion of the coalescence among the grains. (9 refs.)

67041 Lateral dopant transport during laser recrystallization of polysilicon. T.I.Kamins (Hewlett-Packard Labs., Palo Alto, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.832-4 (1 May 1983).
Significant lateral dopant transport occurs during seeded laser recrystallization of polysilicon. Both spreading-resistance measurements and voltage-contrast scanning electron microscopy show that phosphorus, arsenic, and boron are transported several tens of microns in the direction of the beam travel during recrystallization, while much less transport is observed in the other directions. The dopant motion orthogonal to the beam scan is consistent with liquid-phase diffusion. (7 refs.)

67042 Effect of pulse laser emission on mercuric telluride. I.V.Kurilo, S.G.Kiyak, I.P.Palivoda (Lenin Komsomol Lvov Polytech. Inst., Lvov, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.783-6 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.935-8 (June 1982). [received: Feb. 1983]
It was established that secondary crystallization after irradiation of HgTe single crystals leads to the formation of single-crystal layers with the same unit cell parameters as those observed prior to irradiation. An increase in the concentration of the vacancies is observed in the case of HgTe samples of the p-type, while conversion of the type of conductivity is observed in the case of samples of the n-type. The mechanical properties of the surface of recrystallized layers are irregular, and this should be taken into account in the creation of structures based on HgTe with the aid of laser technique. (4 refs.)

67043 The properties of crystalline silicon under laser irradiation. R.Car, A.Selloni, J.F.Janak, S.T.Pantelides (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1007-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The initial effect of laser irradiation is the excitation of electron-hole pairs. It has not, however, been established whether the excited electrons transfer their energy to the lattice rapidly (leading to thermal annealing), or retain it for long times (leading to annealing caused by the softening of the lattice resulting from the presence of the excited electrons). The authors use parameter-free, self-consistent calculations to investigate the consequences of large concentrations of excited electrons in the absence of energy transfer to the lattice. They assume that the excited electrons reach thermal equilibrium among themselves. The valence-band density of states remains essentially unchanged and it is concluded that the observed large changes in the valence photoemission spectra cannot be attributed to the presence of excited electrons, but are more likely due to surface reconstruction. The lattice contracts for all but extremely high concentrations of excited electrons. This result supports Gauster's analysis of his experimental data, according to which electronic contraction occurs at low levels of excitation, whereas, at higher levels of excitation, the observed dilation is due to transfer of energy from the electronic system to the lattice. Finally, the authors discuss the relevance of their results to more recent suggestions about the role of the excited electrons during laser annealing. (15 refs.)

67044 Pulsed laser annealing of semiconductors. Experimental facts and open questions. H.Kurz (Philips GmbH Forschungslab., Hamburg, Germany), J.M.Liu, N.Bloombergen.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1010-13 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The main experimental facts about pulsed laser annealing of ion-implanted semiconductor surfaces are summarized, and some questions of basic scientific

interest are discussed. Special attention is paid to a series of experiments, where the interaction of single-crystal silicon with picosecond laser pulses is studied systematically. The growing evidence for the validity of a simple thermal model is reviewed within the framework of these results, which deliver decisive experimental data for the discussion of the energy transfer routes on a ps time scale. (23 refs.)

67045 **CO_2 laser oxidation of silicon.** I.W.Boyd, J.I.B.Wilson (Heriot-Watt Univ., Edinburgh, Scotland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1030-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A CW CO_2 laser has been used to grow small silicon oxide deposits on heated Si wafers. These oxides have similar electrical properties to furnace-grown SiO_2, and have been used in rectifying diodes. Their infrared absorption band at 1070 cm^{-1} is narrower than for conventional SiO_2 on Si wafers, and their refractive index is 1.465 ± 0.01 for thicknesses of 40 nm to 140 nm. (8 refs.)

61.80C X-rays

67046 **Influence of lithium and sodium on radiation defect formation in a KDr crystal in the temperature region 4.2-300K.** A.K.Dauletbekova, A.T.Akilbekov, A.A.Elango (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1654-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2920-4 (Oct. 1982). [received: April 1983]
The generation of radiation defects (F-H and α-I pairs) by X-rays in KBr with varying Li and Na concentrations (from 10^{-4} to 1 mole %) is investigated by absorption in the temperature region 4.2-200K. The influence of the impurities at different temperatures is established: at 4.2K impurities capturing excitons suppress the generation of both F-H and α-I pairs; in the temperature region between the delocalization of the H centers and that of the H_A centers (50-230K in KBr-Li) impurities localizing H_A centers decrease the separation into F-H_A pairs, increasing the efficiency of F-$H_A \rightarrow \alpha$-I conversion, and suppress the association of H centers; at 300K the impurities mostly influence the association of H centers. 67047 **Gamma irradiation induced photochemical reactions in V-doped borate glasses.** M.M.Morsi, E.M.H.Ibrahim, A.M.Nassar (Nat. Res. Centre, Cairo, Egypt).
J. Solid State Chem. (USA), vol.47, no.2, p.201-9 (April 1983).
Glasses of the composition $X Na_2O.4Al_2O_3(96-X)B_2O_3$(mole%) where $X=10$, 20, 30 to which 0.03 g V_2O_5 per 100 g glass was added, were prepared by normal melting. Their absorption characteristics together with the corresponding v-free base glasses were determined before and after gamma irradiation. The characteristic spectra of the unirradiated glasses show absorption bands at 315, 470, 560-580, 610-650, 700-870, and 860-1000 nm, indicating the presence of vanadium ions in more than one oxidation state, namely V^{5+}, V^{4+}, and V^{3+}. Gamma irradiation of V-containing glasses causes the formation of color centers in the glass matrices, with absorption bands at 330, 500, and 610 nm, and photoreduced $[V^{3+}]$ and $[V^{2+}]$ ions with absorption bands at 350-355 and 530-570 and 520 nm, respectively. Photoreduced $[V^{4+}]$ may also be formed, giving rise to absorptions at 690-700 and 750-800 nm. The induced vanadium ions are found to absorb at shorter wavelengths than the intrinsic ones. An explanation based on the difference in the field energy of the two states is given. (21 refs.)

67048 **Treatment of metals by a beam of electrons for obtaining products with the properties of a bimetal.** E.S.Machurin, G.M.Lonchin, A.N.Shiryaeva, A.V.Gryzlov.
Elektron. Obrab. Mater. (USSR), no.1, p.24-7 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
The thermosensitive characteristics of an alloy, compositionally close to alloy 32NK, after it had been irradiated by electrons were investigated. It is shown that after this treatment the coefficients of thermal expansion of the irradiated and unirradiated parts of the alloy differ by more than an order. Hence a plate or blade, half of which has been treated by a stream of electrons, can act as a thermosensitive element. The transition zones between irradiated and unirradiated portions were studied. (1 ref.) *A.J.B.*

67049 **Radiation-induced crystallinity changes in linear polyethylene.** S.K.Bhateja (Saran & Converted Products, Dow Chem. Co., Midland, MI, USA), E.H.Andrews, R.J.Young.
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.523-36 (April 1983).
Two kinds of ultrahigh-molecular-weight linear polyethylene (UHMW PE), together with conventional high-density polyethylene (HDPE), were subjected to β irradiation, and changes in their properties were monitored. Elastic modulus increased steadily with dose for all materials, as did the yield stress. A dramatic rise of density with dose was observed in the UHMW PE specimens accompanied by a corresponding increase in heat of fusion, X-ray crystallinity, and peak melting temperature. The magnitude of such changes in HDPE was much smaller. In UHMW PE specimens, the X-ray long period simultaneously decreased but crystal thickness remained constant. No changes in long period occurred in HDPE. The effects are attributed to the scission of tie molecules in UHMW PE followed by a growth in the perfection of the crystal lamellae and suggest a method for assessing the tie-molecule content of such materials. (23 refs.)

67050 **Morphological change in agglomerated gold films during electron beam irradiation.** B.G.Atabaev, S.S.Elovikov, A.S.Ovsyanitskii (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1541-3 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2719-23 (Sept. 1982). [received: April 1983]
The morphological change occurring in agglomerated gold films of 1.5, 4.5 and 6.0 nm effective thickness is investigated during electron beam irradiation with energies E_i=600-3000 eV at a beam density j=5 A m^{-2} and doses $D \sim 10^{22}$ m^{-2}. It is shown that the irradiation effect depends upon the initial film structure and the surface charge distribution. (11 refs.)

67051 **Decay of electronic excitations at pairs of charged Frenkel defects in KI.** V.M.Lisitsyn, V.I.Sigimov, V.Yu.Yakovlev (S.M. Kirov Polytech. Inst., Tomsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1555-8 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2747-52 (Sept. 1982). [received: April 1983]
Using pulsed absorption spectroscopy with nanosecond time resolution the authors have studied the kinetics of the generation and decay of α and *F* color centers in crystalline KI when it is acted upon by a 10 nsec pulse of accelerated electrons. They have shown that, in addition to *F* centers, α centers are created as primary products of the decay of electronic excitations. At 80K the generation of α centers dominates. As the temperature is increased over the range 80-300K the efficiency for α center generation increases with an activation energy of 17 meV. A model is proposed for the formation of an α-I pair of defects, via decays of a dihalide self-localized exciton, which satisfactorily describes the experimental results. (12 refs.)

67052 **Efficiency of formation of paramagnetic defects in silicon by neutron irradiation.** A.Kh.Antonenko, A.V.Dvurechenskii, L.S.Smirnov, V.A.Kharchenko (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1302-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2018-21 (Nov. 1982). [received: April 1983]
A study was made of the accumulation of vacancy and interstitial defects, and of vacancy-oxygen complexes in silicon irradiated with neutrons

($T_{irr} \lesssim 60°C$). The defect concentration was proportional to the neutron dose right up to doses of $\phi \approx 5.10^{18}$ cm^{-2}; in the range $\phi > 10^{19}$ cm^{-2} the efficiency of formation of paramagnetic centers decreased and the concentration of these centers tended to the following limiting values: $\sim 2.10^{16}$ cm^{-3} for tetravacancies and diinterstitials and $\sim 1.10^{16}$ cm^{-3} for complexes consisting of two vacancies and an oxygen atom. In the case of interstitial defects the saturation of the dose dependences was observed earlier than in the case of the vacancy complexes. A comparison of the results obtained with the data of ion bombardment experiments indicated that amorphization of silicon could not be achieved by neutron irradiation. (15 refs.)

67053 Liberation of helium in the heating of irradiated boron carbide. V.G.Kovyrshin.
Sov. At. Energy (USA), vol.53, no.2, p.570-1 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.112-13 (Aug. 1982). [received: April 1983]
Radiation damage to boron carbide is produced primarily by the formation and accumulation of helium atoms. The interaction of these atoms with the original and radiation defects at increased temperatures promote an escape of helium to the surface and diffusion into the material, which is accompanied by the formation of gas porosity and swelling. Therefore, special attention is being paid to the investigation of the behavior of helium in boron-containing materials. The authors studied the kinetics and determined the energy characteristics of processes of thermal desorption during the heating of irradiated samples of unenriched boron carbide. (7 refs.)

67054 Ion-induced amorphous and crystalline phase formation in Al/Ni, Al/Pd, and Al/Pt thin films. L.S.Hung, M.Nastasi, J.Gyulai, J.W.Mayer (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.672-4 (15 April 1983).
Amorphization by ion beam irradiation of multilayered samples of Al/Pt, Al/Pd, and Al/Ni has been investigated by selected area diffraction and Rutherford backscattering. With a dose of 2×10^{14} Xe ions/cm^2, uniform mixing is achieved in the Al/Pt system and the amorphous phase is produced over a large composition range. In the Al/Pd and Al/Ni systems, amorphous phases or the equilibrium, crystalline phases are formed depending on the composition of the films. The same results were found when the samples were annealed to form crystalline phases before bombardment. For thin films of these FCC metals, only the simplest intermetallics, NiAl and PdAl, (primitive cubic structures with 2 atoms/cell) were formed in crystalline form by ion-beam irradiation. (9 refs.)

67055 In situ studies of the effects of ion beams on materials using the electron microscope ion beam interface. S.Ishino, H.Kawanishi, K.Fukuya, T.Muroga (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1255-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
To investigate microstructural evolution by cascade damage produced by energetic heavy particles, the authors have built a facility which is capable of observing damaged structure introduced by heavy ions in situ in an electron microscope. A 400 kV Cockcroft-Walton type heavy ion accelerator with a Danfysik 911A heavy-ion source has been combined with a 200 kV electron microscope. Heavy ion beams of energies up to 400 keV can bombard the specimen in the microscope with an incident angle of 45 degrees to the electron beam axis. This paper describes the outline of the facility and some of the recent results mainly concerned with heavy radiation damage of materials which are relevant to fast breeder and fusion reactor development. (14 refs.)

67056 Recent work using the ANL HVEM-ion beam interface. A.Taylor, E.A.Ryan (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1263-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The ANL-Materials Science and Technology Division High Voltage Electron Microscope-Tandem Facility is a unique national research facility for in-situ studies of the interaction of energetic particle with solids. The ion-beam interface permits ion beams from either a 300-kV Texas Nuclear or a 2-MV National Electrostatics Tandem accelerator to be transported into the stage of the Kratos EM7 1.2-MV HVEM. The current status of research projects employing the ion-beam interface is reported. (2 refs.)

67057 Damage analysis and atom site determination in ion-implanted GaAs using low energy proton channeling and PIXE. P.P.Pronko, R.S.Bhattacharya (Universal Energy Systems Inc., Dayton, OH, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1709-12 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The use of proton channeling and proton induced X-ray excitation (PIXE) for damage analysis and lattice location measurements is reviewed with emphasis given to those aspects of the measurements that relate backscattering to X-ray excitation. Angular scan curves from backscattering spectra are compared to those of PIXE spectra and discussed in terms of exact versus nonexact substitutionality. Details concerning the energy dependence of X-ray production, matrix absorption, and depth dependent cross sections are presented and their significance to damage measurements assessed. Examples are given of damage analysis and substitutionality measurements for sulfur implanted in GaAs. The use of PIXE for measuring relative displacement rates for Ga and As in ion irradiated GaAs are also discussed. (9 refs.)

67058 The effect of preinjected gas atoms on depth dependent damage in self-ion irradiated nickel. D.B.Bullen, J.H.Billen, G.L.Kulcinski (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1743-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The effect of interstitial gas atoms on cavity formation in self-ion irradiated nickel specimens is studied utilizing a 700 keV accelerator to inject H$^+$ or He$^+$ ions into nickel foils. A tandem accelerator then irradiates the foils with 14-MeV nickel to produce displacement damage. Details of the irradiation facilities are presented. Sample preparation and analysis techniques are described. Preliminary results and plans for future experiments are described. (21 refs.)

67059 Effect of ion-beam damage on X-ray diffraction and Raman spectra of amorphous GeSe$_2$. M.Marcus, R.C.Dynes, J.E.Griffiths, D.McWhan (Bell Labs., Murray Hill, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1792-4 (April 1983).
Raman and X-ray measurements were done on amorphous GeSe$_2$ films before and after damage with 10^{177} α^+ cm^2. The first diffraction peak got smaller and shifted to higher wave vectors. The Raman spectrum did not change. The order seen as the first sharp diffraction peak may not be that manifested by the 'companion' Raman line. (7 refs.)

67060 A simultaneous study of lattice expansion and swelling in proton-bombarded GaP single crystals. C.Ascheron (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany), A.Schindler, V.Geist, G.Otto.
Radiat. Eff. Lett. (GB), vol.68, no.5, p.149-53 (1983).
The swelling and the lattice expansion of proton bombarded GaP single crystals are simultaneously measured for different proton doses by the 'Talystep' method and by the Kossel technique, respectively. The results reveal a good agreement between the increase in interplanar spacing and the volume change in the damaged region. (21 refs.)

67061 The analysis of Rutherford scattering-channelling measurements of disorder production and annealing in ion irradiated semiconductors. G.Carter, R.G.Elliman (Dept. of Electronic & Electrical Engng., Univ. of Salford, Salford, England).
Radiat. Eff. Lett. (GB), vol.68, no.5, p.155-67 (1983).
Study of the observed backscattering signal, either from fixed depth or depth integrated, as a function of implant ion fluence, has been used to infer, qualitatively, the nature of the disorder production for a variety of energy deposition density conditions in Si and GaAs implanted $\sim$40K to minimise annealing processes. These processes range from simple defect accumulation until a sufficiently high local defect density is reached with increasing fluence that relaxation to amorphousness occurs to direct impact amorphisation in individual cascades where defect densities are sufficiently large to cause instant collapse to amorphousness. RBS/channelling results of log (yield) as a function of log (implant fluence) can be used to distinguish probable disordering mechanisms, to estimate disorder densities required for amorphousness collapse and to investigate thermal annealing processes. (13 refs.)

67062 Stoichiometry effects at NiMo surfaces under bombardment with Ar$^+$ ions from 40 to 2000 eV. J.Bartella, H.Oechsner (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.581-8 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The stoichiometric variations at and below the surface of a polycrystalline 79.2Ni-20.8Mo alloy being induced by normal bombardment with Ar$^+$ ions of 40 to 2000 eV have been investigated with AES. A special plasma arrangement was used as a laterally homogeneous ion source. The depth dependent compositional variations in the uppermost atomic layers are derived from the different behaviour of the individual Auger peaks as a function of the energy of bombarding ions. The sputter induced elemental depth distributions are, additionally, sputter depth profiled with 50 eV Ar$^+$ ions. The elemental concentration profiles display a pronounced enrichment of the Mo component in the damaged surface region. With increasing E_0 the maximum of the bombardment induced Mo concentration profile is shifted to a distance up to several atomic layers below the surface. The results supply not only detailed information on bombardment induced stoichiometric changes with depth, but also on the size and the shape of the atomic collision cascades in sputtering. (7 refs.)

67063 Influence of the degree of doping of a semiconductor on the redistribution of boron in silicon as a result of high-temperature proton irradiation. V.V.Kozlovskii, V.N.Lomasov, G.M.Gur'yanov, A.P.Kovarskii.
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1350-1 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2089-90 (Nov. 1982). [received: April 1983]
Investigates a redistribution of boron in homogeneously doped silicon. When the dopant concentration was below 10^{18} cm^{-3}, a maximum impurity distribution was observed in the region at the end of the proton range (R_p) instead of the usual minimum found in samples in which the overall impurity concentration was higher. The impurity concentrations in the samples ranged from 1.5×10^{17} to 2.5×10^{19} cm^{-3}; the other factors influencing the nature of the process of impurity redistribution (proton energy and current density, irradiation temperature) were kept constant. (7 refs.)

67064 Irradiation of diamond by α-particles from ^{244}Cm. V.G.Gordeev, V.A.Nikolaenko, S.V.Pirozhkov, I.K.Shvetsov.
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1362-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2215-17 (Nov. 1982). [received: May 1983]
The use of α radiation from transuranic elements is combined with X-ray techniques directly during irradiation to study how radiation-induced defects alter the properties of materials. An experiment is described in which diamond powder is irradiated by α particles from ^{244}Cm and the change in the unit cell parameter in diamond as a function of the radiation dose is reported. (4 refs.)

67065 Trapping of impurity atoms by defects and the distribution of clusters during ion bombardment of growing films. T.D.Radzhabov, Z.A.Iskanderova, E.O.Arutyunova, K.R.Samigulin (U.A. Arifov Inst. of Electronics, Acad. of Sci., Tashkent, Uzbek SSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1375-9 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2238-44 (Nov. 1982). [received: May 1983]
Trapping of gaseous impurity atoms by defects during growth is treated from a theoretical standpoint when ion implantation is accompanied by simultaneous diffusion. Density profiles are determined analytically and by numerical analysis for the impurity-defect clusters as a function of distance in the film and substrate, and the main features of trapping of impurity particles by defects are determined over a wide range of experimental parameters. The effects of impurity trapping by defects on the magnitude and distribution of the total impurity atom density and on the total rate at which the bombarding ions are absorbed in the film are studied. It is shown how to obtain films with a high and nearly uniform impurity-defect cluster density under typical experimental conditions and how to increase the total absorption of gas impurity by using films with an increased density of impurity-trapping defects. (17 refs.)

67066 Sputtering of the surface of gold by fission fragments. V.V.Obnorskii, I.A.Baranov, N.V.Badadzhanyants, B.G.Yarullov.
Sov. At. Energy (USA), vol.53, no.2, p.559-60 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.105-6 (Aug. 1982). [received: April 1983]
Both bulk samples (foil 20 μm thick) and thin, finely granular layers deposited by thermal sputtering in a vacuum on substrates made out of a dielectric (glass) and a metal (platinum) have been used in connection with the determination of the sputtering coefficients K of gold by fission fragments from an external source. In order to clarify the sputtering mechanism of bulk gold by heavy, multiply-charged ions of the fission-fragment type, the dependence of K on the variation of the mean fragment energy has been investigated. (8 refs.)

67067 Estimation of stacking-fault energy of Frank loops in OKh16N15M3B austenitic stainless steel. Yu.V.Konobeev, S.I.Rudnev.
Sov. At. Energy (USA), vol.53, no.2, p.563-4 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.107-8 (Aug. 1982). [received: April 1983]
Vacancy pores and dislocation loops form in OKh16N15M3B austenitic steel under bombardment with iron ions of an energy of 12-18 MeV in the internal beam of the U-300 cyclotron. Electron-microscope examination of the microstructure of steel irradiation with a damaging dose of 80 displacement/atom showed that dislocation loops are observed in the range 400-600°C. At a temperature above 450°C, all of the loops are prismatic, while the dislocation loops are primarily Frank loops. From observed data the authors estimate the stacking-fault energy of Frank loops. 67068 Effect of pressure differential on channeling in thin Si crystals. R.B.Alexander, S.C.Johnson, K.R.Padmanbhan (Dept. of Phys. & Astron., Wayne State Univ., Detroit, MI, USA), J.C.Buchholz.
Appl. Phys. Lett. (USA), vol.42, no.9, p.804-6 (1 May 1983).
The effect on ion channeling in thin Si single crystals of distortion produced by a pressure differential has been investigated. At a threshold pressure of several Torr in a Si-air cell, an abrupt increase occurs in the channeling minimum yield. Measurements have been made of the distortion using reflection of laser light, which produces an unusual interference pattern. A geometric model is proposed in which the minimum yield is determined by the tilting of the channels perpendicular to the bowed crystal surface. (11 refs.)

67069 Channeling contrast microscopy: Application to semiconductor structures. J.C.McCallum, C.D.McKenzie, M.A.Lucas (School of Phys., Univ. of Melbourne, Parkville, Australia), K.G.Rossiter, K.T.Short, J.S.Williams.
Appl. Phys. Lett. (USA), vol.42, no.9, p.827-9 (1 May 1983).
A new technique is demonstrated for the imaging of semiconductor structures. The technique involves the use of a channeled $^4He^+$ microbeam, scanned across the surface to provide a channeling-contrast image of subsurface lattice disorder and atom location. The present arrangement provides a lateral resolution of ~5 μm and an in-depth resolution of ~30 Å. The technique is applied to the imaging of small, laser annealed regions on ion implanted silicon wafers. (12 refs.)

67070 Potential information and stopping power from channeling in diamond. R.D.Edge, R.W.Fearick, T.E.Derry, J.P.F.Sellschop (Nuclear Phys. Res. Unit, Univ. of the Witwatersrand, Johannesburg, S Africa).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1060-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
When a carefully cleaned diamond crystal was bombarded with helium nuclei parallel to a low index plane, up to seven peaks in the energy spectrum of backscattered ions were seen. These arose from particles oscillating to and fro across the channel as they progressed along it. Spectra taken with ions incident in different directions in the same plane allowed both the wavelengths of the oscillations in the channel, λ, and the stopping power within the channel to be obtained. The character of the oscillations changed as the beam deviated from exact alignment with the channel, giving the highest maximum at an angle ψ_m to the channel. Calculations based on those of Barrett (1979) employing λ, ψ_m, and the stopping power showed a smoother potential for the {111} planar channel, which has a larger spacing, than {100} and {110}. The energy dependence of the stopping power and oscillation wavelength was also determined from 0.2 to 1.2 MeV for the {110} planar channel. (9 refs.)

67071 Charge dependence of slow-ion energy losses in transmission experiments. J.Shchuchinsky, C.Peterson, W.Brandt (New York Univ., New York, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1063-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Modifications of the beam line, detector system, and use of Rutherford-scattered particles to correct for beam-current fluctuations, were made to increase the precision of heavy-ion energy-loss measurements in penetration experiments performed at the New York University Accelerator Facility. Ar^+, Ar^{++}, and Ar^{3+} ions were incident on the same domain of C, Al, and Au foils. The energy loss distributions of Ar^+, Ar^{++}, and Ar^{3+} ions after transmission through the foils were measured under identical conditions. The authors found an increase in the energy loss with increasing charge of the ions. The data are discussed in terms of the relation between the effective stopping-power charge of projectiles inside the solids and the ionic charge of particles incident on and emerging from the foils. (7 refs.)

67072 Range distributions of low energy ions in silver and copper. A.Zomorrodian, S.Tougaard, A.Ignatiev (Phys. Dept., Univ. of Houston, Houston, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1066-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Range distributions of 1-5 keV nitrogen ions in polycrystalline copper and silver substrates are measured and compared with available theories. The distribution consists of a surface localized peak, a shoulder/second peak and a long tail. The shoulder/second peak and tail are well explained by theories, however, the surface localized peak is a new feature for which several mechanisms have been investigated. (15 refs.)

67073 Stopping power for fast nitrogen and oxygen diclusters in carbon. M.F.Steuer (Univ. of Georgia, Athens, GA, USA), D.S.Gemmell, E.P.Kanter, E.A.Johnson, B.J.Zabransky.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1069-73 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Measurements of stopping powers for several diatomic ions are presented and compared to values derived from well known wake models. While independently determined wake forces can be superposed to calculate correctly the stopping forces on light fast ions, such as H_2^+, the method appears to be invalid for slower, more highly charged N_2^+ ions. To include non-linear terms in the interaction wake charge distributions must be determined for pairs of ionic cores. To avoid the complexities of a proper quantum mechanical treatment a semi-classical calculation of free electron scattering by two screened ionic cores was used to determine the stopping forces. While a quantum mechanical calculation is needed to obtain a definitive result the semi-classical calculation provides qualitative agreement with experiment for 3 MeV N_2^+ ions in carbon. (13 refs.)

67074 Some theoretical works on channelling effect and channelling radiation. Guozhu He, Guoju Hu (Dept. of Phys., Nankai Univ., Tianjin, China).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1726-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The trajectory equations for both relativistic and nonrelativistic channelling particles become very simple under general channelling conditions. For many potentials, such as Lindhard potential, the expressions of the trajectories can be obtained in closed form. The complete trajectory in the crystal can be traced out easily in both transverse and longitudinal directions. The backscattering probability as a function of the incident angles has been derived in this trajectory picture and is calculated for several cases: 3 MeV proton on Si(100), 1 MeV proton on Au(111), 1.5 MeV electron on Si(110) and 1 MeV electron on Ag(111). The shapes and widths of these theoretical curves fit well with the experimental results. The wave equations for the channelling relativistic electron and positron have been solved by WKB method. (12 refs.)

67075 Channeling effect of low energy boron implant in (100) silicon. T.M.Liu, W.G.Oldham (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).
IEEE Electron Device Lett. (USA), vol.EDL-4, no.3, p.59-61 (March 1983).
Unintentional ion channeling in low energy ion implantation of boron into (100) silicon results in much deeper junctions than predicted by Lindhard, Scharff, and Schiott (LSS) theory even for wafers tilted 8 degrees from the normal. Both B^+ and BF_2^+ implants show the effect. The characteristics of this partial channeling profile are discussed. An empirical formula is found to describe the enhancement of the junction depth. Experiments also show that the deep penetration tail can be suppressed by a silicon pre-implant to drive the silicon surface layer amorphous. (11 refs.)

67076 Incidence angle dependence of planar channeling in boron ion implantation into silicon. M.Miyake, M.Yoshizawa, H.Harada (Nippon Telegraph & Telephone Public Corp., Musashino, Tokyo, Japan).
J. Electrochem. Soc. (USA), vol.130, no.3, p.716-19 (March 1983).
A new method for estimating the channeling incidence angle dependence using *C-V* profiling technique was developed. Using this method, the incidence angle dependence of (110) planar channeling in boron implantation into silicon was studied. CZ, p-type, 75 mm diam, ⟨001⟩ oriented silicon wafers with 30~50 Ω cm resistivity were used. Boron was implanted into the wafers at 40~150 keV energy and 1×10^{12} cm^{-2} dose. (11 refs.)

67077 A semiclassical approximation for the Wigner distribution function. Application to planar channeling. V.G.Novitzky (Inst. of Metal Phys., Kiev, USSR).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.437-40 (4 April 1983).
Within the framework of the Wigner approach to the quantum mechanics of a single particle the semiclassical approximation for the distribution function in the case of planar channeling is obtained, based on iteration of the classical solution. Application of this method to other one-dimensional evolution problems is proposed. (12 refs.)

67078 Energy distribution measurements of 300 keV transmitted protons at the axial-to-planar channeling transition in silicon. Yu.V.Bulgakov, K.Lenkeit, R.Stolle (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K23-6 (1 March 1983).
During the transition of ions from axial to planar channeling their motion becomes unstable under special conditions thereby affecting the particle energy loss spectrum. The authors have measured the energy distributions of protons with initial energy E_0=300 keV which passed through a thin Si single crystal film under the conditions of transition from the axial ⟨110⟩ to planar (110) channeling. (5 refs.)

67079 The energy dependence of the angles of resonance dechanneling of ions in the ⟨110⟩→(110) axial-to-planar channeling transition in silicon. Yu.V.Bulgakov, K.Lenkeit (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K27-30 (1 March 1983).
The resonance dechanneling of fast ions in planar channels of a monocrystalline target occurs when the period of natural oscillations of particles becomes multiple to the time of their passage between the neighbouring atomic rows that form the walls of the planar channels. The authors present an experimental verification of the resonance conditions using hydrogen and helium ion channeling in Si monocrystalline films. (6 refs.)

67080 Stopping power for N^+ ions with energies from 160 to 440 keV in aluminium. S.V.Yalyshko (Nuclear Phys. Dept., Leningrad Polytech. Inst., Leningrad, USSR), R.Wedell.
Phys. Status Solidi b (Germany), vol.116, no.1, p.K47-50 (1 March 1983).
Results of stopping power measurements for N^+ ions in Al in the energy region 160 to 440 keV are reported. The influence of the Al layer thickness and the ion charge state on the experimental results and also the dependence of the electronic stopping power on the ion velocity are analyzed. The measurements were performed by the method of particle-induced X-ray emission (PIXE). (7 refs.)

67081 Projected ranges and effective stopping powers of electrons with energy between 20 eV and 10 keV. H.Iskef, J.W.Cunningham, D.E.Watt (Dept. of Medical Biophys., Univ. of Dundee, Dundee, Scotland).
Phys. Med. & Biol. (GB), vol.28, no.5, p.535-45 (May 1983).
Experimental projected ranges of electrons between 20 eV and 10 keV have been correlated by a simple scaling factor to yield 'best-fit' expressions applicable to all media. Extrapolated ranges, R_{ex} (in μg cm^{-2}) may be determined from the expressions given. From an analysis of the transmission curves, the following relation between median or mean projected ranges and the extrapolated ranges is obtained: $R_{50}=(0.3655\pm0105)\ R_{ex}{}^{1.024}$, 20 eV$\leq E\leq 10^4$ eV. Differentiation of the extrapolated range-energy expression yields an effective stopping power along the projected track of the electron and is given by: $dE/dR_{ex}=E/[R_{ex}(0.15546\ \ln(E)+0.31104)]$ eV cm^2 μg^{-1}, 20 eV$\leq E\leq 10^4$ eV with a precision of 30%. Improved accuracy of the experimental data is required for track structure applications and to resolve phase effects. (54 refs.)

67082 Electromagnetic radiation of relativistic channeling particles (the Kumakhov effect). V.V.Beloshitsky, F.F.Komarov (Inst. of Appl. Phys. Problems, Belorussian State Univ., Minsk, Belorussian SSR).
Phys. Rep. (Netherlands), vol.93, no.3, p.117-97 (Dec. 1982). [received: April 1983]
A new type of electromagnetic radiation characteristic for relativistic particles channeling in single crystals which has been recently predicted by Kumakhov and proved experimentally is reviewed. It is observed as one or several strong peaks in the soft part of the bremsstrahlung, surpassing it by a factor of nearly one hundred. At moderate electron energies sharp peaks corresponding to spontaneous transitions between quantum eigenstates of the channeling particles were detected. But for high energy channel electrons these peaks merge into one broad classical peak with the frequency determined by the collective potential of an atomic row or plane. This radiation strongly depends on the charge sign, velocity and mass of the particle. (176 refs.)

67083 Configurational compressibility of water. A.Srinivasa Rao (Dept. of Phys., Jawaharlal Inst. , Pondicherry, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.837-8 (Oct. 1982). [received: April 1983]
An expression for the configurational compressibility (β_c) has been obtained for water on the basis of broken hydrogen bond model. The derived formula for β_c shows that it depends on the applied pressure, temperature and the hydrogen bond energy of water. The theoretical values for β_c at 0°C and at normal atmospheric pressure comes out to be 55% of the experimental value for isothermal compressibility (β_T) of water. This compares favourably with the estimated value of 64% for the configurational contribution to β_T of pure water obtained from ultrasonic measurements in glycerol-water mixtures. The formula for β_c is valid up to pressures of 1500 kg/cm^2 and for temperatures below 30°C. (7 refs.)

67084 Influence of point defects due to nonstoichiometry on the densities of oxides. L.A.Krasikov, V.E.Shvaiko-Shvaikovskii (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.7, p.999-1002 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1184-8 (July 1982). [received: Feb. 1983]
The changes in density in oxides with various point defects are discussed in relation to the oxide content ΔX of the oxide. It is shown that, if the sign of the coefficient relating $\Delta\rho/\rho$ to ΔX is known and also the sign of X itself (i.e. in essence the sign of the exponent of pO_2), then the type of point defects can be assessed. (4 refs.)

67085 Random field of internal stresses from point defects in a crystal. A.S.Mel'nichenko (Inst. of Steel & Alloys, Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.717-20 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.43-7 (Aug. 1982). [received: April 1983]
The variance and correlation function are calculated for the internal stress field created by point defects situated independently at random lattice points in a crystal. For equal concentration dilatations, the amplitude of the internal stresses in a FCC lattice is several times the amplitude in a BCC lattice. It is shown that the stress field is practically uncorrelated and its probability density function is represented by an Edgeworth asymptotic series. An asymptotic representation of the stress distribution is proposed in the form of a superposition of a discrete stress spectrum and a normally distributed 'background.'. (11 refs.)

62.20D Elastic constants

(see also 03.40D Mathematical theory of elasticity, 81.40J Elasticity and anelasticity)

67086 Elastic moduli of a cracked body. L.G.Margolin (Los Alamos Sci. Lab., Univ. of California, Los Alamos, NM, USA).
Int. J. Fract. (Netherlands), vol.22, no.1, p.65-79 (May 1983).
Statistical solutions for the internal stress and displacement fields are constructed for a body in an external applied stress field, and containing a prescribed distribution of penny shaped cracks. From the fields, a stress-strain relationship is calculated for the body, and effective elastic moduli are derived. The fields are constructed as expansions in the parameter $N\bar{a}^3$ which is assumed small (N is the crack density, and a is the crack radius). Angular integrals over the distribution function are performed for two special cases that represent a bedded crack distribution, and an isotropic crack distribution. A criterion for the validity of the use of these quasistatic results in dynamical calculations is presented. (8 refs.)

67087 Thermal expansion coefficient and Young's modulus of hydrogenated FCC Fe-Ni Invar alloys. S.Harada (Faculty of Engng., Niigata Univ., Niigata, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1306-10 (April 1983).
Thermal expansion coefficient and Young's modulus of hydrogenated FCC Fe-Ni Invar alloys have been measured as a function of temperature and hydrogen concentration. Anomalous behaviour in thermal expansion and Young's modulus of the Invar alloys was faded with hydrogenation. This change corresponds to the disappearance of the characteristic weak ferromagnetic states of Fe-Ni Invar alloys, which was previously investigated by means of Mossbauer effect. The experimental results of thermal expansion, Young's modulus and Mossbauer effect were interpreted on the basis of the electron theory.

67088 Effective elastic properties of axial textures. Yu.V.Kuzmenko, V.I.Korneev, T.D.Shermergor (Inst. of Electronic Technol., Moscow, USSR).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.169-74 (April 1983).
A method for the determination of the effective elastic constants of polycrystals with texture was developed. The self-consistent approximation, energy and variational bounds were obtained on the basis of a singular approximation method of random functions. Numerical results were presented for the axial texture of polycrystalline copper. The calculations showed that the variational bounds are more restricting than the widely used energy bounds and lie within them. The self-consistent approximation always lies within the variational bounds. In the limiting cases of an isotropic polycrystal and exact orientation of crystallite axes along the axis of texture, the well-known results were obtained. (19 refs.)

67089 New third-order bounds on the effective moduli of N-phase composites. N.Phan-Thien (Univ. of Sydney, Sydney, Australia), G.W.Milton.
Q. Appl. Math. (USA), vol.41, no.1, p.59-74 (April 1983).
The authors develop some new bounds on the effective moduli of N-phase composites. These new bounds are accurate up to and including terms of third order in $O(|K_i\text{-}K_j|,\ |\mu_i\text{-}\mu_j|)$, where K_i and μ_i are the bulk and shear modulus, respectively, of phase i. These bounds use the same statistical information as J.J. McCoy's (1981) and M. Beran and J. Molyneux's (1965) bounds but are tighter than, or at worst coincident with, the latter bounds. A new perturbation solution is also presented for the effective moduli which only requires that $|\delta\mu|=O(|\mu_i\text{-}\mu_j|)$ be small. (21 refs.)

67090 Pressure variation of the elastic moduli of the sodium halides. S.Hart, P.H.Greenwood (Nat. Phys. Res. Lab., Pretoria, S Africa).
Solid State Commun. (USA), vol.46, no.2, p.161-4 (April 1983).
An ultrasonic study has been made of the variation of the elastic moduli of single crystals of the sodium halides to 1.5 GPa. A quadratic fit is required for the data. The systematics and in particular the second derivative of the bulk modulus has been found to be in general agreement with predictions of the Born model of the equation of state. (14 refs.)

67091 The temperature dependence of the elastic constants for highly oriented pyrolytic graphite determined by ultrasonic techniques. D.M.Hwang (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA).
Solid State Commun. (USA), vol.46, no.2, p.177-81 (April 1983).
Sound velocities along the c-axis of highly oriented pyrolytic graphite between 4 and 325K were measured with an ultrasonic pulse-echo phase-comparison

method. The echo delay times were determined with an accuracy of 0.05 and 0.15%, respectively, for the longitudinal and transverse modes. The temperature dependence of the *c*-axis elastic constants C_{33} and C_{44} was deduced with the correction of thermal expansion. C_{33} was found to decrease by 5.8% from 4 to 300K and can be interpreted by a model based on the simple Lennard-Jones interlayer interaction. C_{44} and its temperature variation are found to be strongly sample dependent. (20 refs.)

67092 Temperature derivatives at constant volume of the elastic constants of alkali halide crystals. J.Shanker (Dept. of Phys., Agra Coll., Agra, India), R.K.Varshney.
Solid State Commun. (USA), vol.46, no.3, p.263-4 (April 1983).
A new method has been developed for calculating the temperature derivatives at constant volume of the elastic constants of the alkali halides using the concept of phonon pressure. Calculated values of temperature derivatives of elastic constants are compared with the corresponding values recently derived from ultrasonic experimental data. (6 refs.)

67093 Pressure dependence of elastic constants of orthorhombic $Li_2Ge_7O_{15}$ above and below the ferroelectric transition. S.Haussuhl (Inst. fur Kristallographie, Univ. zu Koln, Koln, Germany).
Solid State Commun. (USA), vol.46, no.5, p.423-6 (May 1983).
The pressure derivatives of the elastic constants c_{ij} of orthorhombic $Li_2Ge_7O_{15}$ have been determined at 293K by the method of pressure-induced shifts of resonance frequencies of thick plates at ca. 15 MHz in the range between 0 and 1500 bar. Approaching the transition at ca. 630 bar, all $P_{ij}=dc_{ij}/dp(i, j=1,2,3;p$ pressure) develop strongly negative values. At higher pressures a similar behaviour with reversed sign is observed. The pressure derivatives of the pure 'shear resistances' c_{44}, c_{55}, and c_{66} depend only slightly on pressure even in the vicinity of the transition. The main interactions driving the transiton are of the totally symmetric type. The values dK^{-1}/dp (K volume compressibility) deviate strongly from the quasi-invariant value of ca. 5 observed in almost all stable crystals ($dK^{-1}/dp=-1750$ at 620 bar and 1380 at 700 bar). The anomalous piezoelastic behaviour reflects the anomalous thermoelastic behaviour: negative P_{ij} in the low pressure (high temperature) phase correspond to positive T_{ij}-d log c_{ij}/dT (T temperature) and vice versa. 62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L Deformation, plasticity and creep)

67094 Effective compressibilities of some ionic semi-conducting compounds of IV-VI group. B.R.K.Gupta, S.Singh (Dept. of Phys., G.B. Pant Univ. of Agriculture & Technol., Pantnagar, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.455-61 (1983).
An analysis of effective compressibilities of the ionic semiconductors PbS, PbSe, PbTe and SnTe has been performed within the framework of many body lattice theory (MLT). The extended three body force shell model (ETSM) which is ultimately based on MLT has been employed to evaluate the values of effective compressibilities of the solids under study. The model parameters have been calculated by using the expressions of elastic, optical and dielectric constants within the framework of the theory described in ETSM. The values of elastic constants and long wave optical vibration frequency have been used in the expressions as input data. The analysed values of β^*/β are in close agreement with the results obtained from the Szigeti relation. (16 refs.)

67095 Anisotropic yield surfaces in cyclic plasticity. S.J.Harvey, P.Adkin (Lanchester Polytech., Coventry, England), P.J.Jeans.
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.89-99 (1983).
An anisotropic form of the Von Mises yield criteria is presented which includes linear terms and therefore enables Bauschinger effects to be considered when constructing yield or loading surfaces. The coefficients representing the state of anisotropy are expressed in terms of the uni-axial and shear yield stress of the material. It is suggested that this form of the yield or loading surface can be used to determine the plastic strains for a range of multi-axial and cyclic plasticity problems and results are presented for the particular case of a tube subjected to cyclic plastic torsion with an axial stress. (17 refs.)

67096 Yield point and dislocation mobility in silicon and germanium. W.Schroter (Phys., Inst., Univ. Gottingen, Gottingen, Germany), H.G.Brion, H.Siethoff.
J. Appl. Phys. (USA), vol.54, no.4, p.1816-20 (April 1983).
Measurements of the lower yield point in silicon and germanium, covering wide ranges of temperature and strain rate, are presented. The results indicate that Haasen's model for the beginning of the plastic deformation of semiconductors has to be modified for germanium, while it is confirmed for silicon. (27 refs.)

67097 Kinetics of strain-induced reorientation of zinc-sulfide and zinc-selenide crystal structures. S.A.Omel'chenko, S.I.Bredikhin, P.A.Berlov, M.F.Bulanyi, S.Z.Shmurak, A.Ya.Yakunin (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1586-9 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2803-8 (Sept. 1982). [received: April 1983]
The effect of plastic deformation of zinc-sulfide and zinc-selenide crystals on their crystal structure and on the symmetry of Mn^{+2} impurity centers is investigated. It is shown that the plastic deformation and the structural reorientation of the ZnS crystals result exclusively from the motion of partial dislocations; the kinetics of this process is investigated. A similar structure reorientation was observed in twinning ZnSe crystals. The contribution of the partial and regular dislocations to the plastic deformation of ZnSe crystals is determined. (9 refs.)

67098 Peculiarities of the plastic deformation of crystals with a curved lattice. B.I.Smirnov, V.I.Nikolaev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1724-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3045-50 (Oct. 1982). [received: April 1983]
Experiments were conducted to study the characteristics of plasticity and the evolution of the dislocation structure produced by single slip in LiF crystals having a curved lattice. Specimens with such a lattice were predeformed by bending or torsion. An increase in the angle of bending or torsion was shown to lead to a strong increase in the work-hardening coefficient. The length of the plateau of flowability and the density of edge components of the dislocations are practically independent of this angle. The change in the nature of hardening in crystals with a curved lattice was explained by the fact that slip in these crystals is geometrically nonlinear (the slip 'planes' transform into surfaces) and a large number of steps of like sign may occur in the dislocations. (9 refs.)

67099 Motive forces of plastic deformation and rotations in crystals with internal boundaries. A.E.Volkov, V.A.Likhachev, P.I.Nikolaev (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.737-40 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.65-8 (Aug. 1982). [received: April 1983]
The forces acting on the internal boundaries from the homogeneous and inhomogeneous components of the stress field are calculated. An interpretation of the torque stress is given, within the framework of theories using symmetric stress in media with an inhomogeneous structure. The reasons for the appearance of plastic deformations and rotations in the crystal are discussed. (7 refs.)

62.20H Creep

(see also 81.40L Deformation, plasticity and creep)

67100 Diffusive relaxation of stress concentrations at grain boundary cavities in elevated temperature creep. A.A.Rubinstein (Dept. of Mech. Engng., State Univ. of New York, Stony Brook, NY, USA).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.593-616 (1983).
Deals with certain aspects of elevated temperatures creep cavitation of grain boundaries under cyclic and rapidly applied loading. The response of partially damaged materials (where damage is represented as crack-like cavities on the grain boundaries) following load alterations at temperatures in the vicinity of 0.5 T_m or higher is analyzed. The interaction between grain boundary diffusion and elastic deformation is important in alleviating local stress concentrations under these conditions. The stress levels considered are assumed to be low enough that plastic deformation is significant. Diffusive processes contribute to high temperature creep rupture by material redistribution from the void surfaces to the grain boundaries, and any non-uniform matter accommodation along the grain boundaries is accomplished by elastic deformation under the conditions assumed. The same material redistribution mechanism dominates in the stress relaxation process. The analysis of the stress and displacement fields is based on consideration of the coupled elasticity-diffusion boundary value problem, which leads to an integral equation. On the basis of the solution obtained, the detailed analysis of the process under cyclic, step and ramp loadings is given. (14 refs.)

67101 Pure diffusional creep of NiO polycrystals. M.Jimenez-Melendo, J.Cabrera-Cano, A.Dominguez-Rodriguez, J.Castaing (Dept. de Optica, Univ. de Sevilla, Seville, Spain).
J. Phys. Lett. (France), vol.44, no.9, p.L339-43 (1 May 1983).
Compressive creep testing of polycrystalline NiO has been performed in air and argon, at temperatures between 1100 and 1500°C (0.61 to 0.79 T_M) under loads corresponding to initial applied stresses from 6 to 90 MPa. Nabarro creep was observed in the lower stress range; creep rate and oxygen diffusivity show a good correlation. (9 refs.)

67102 Cracking due to a plate-form inclusion of shear type. Zhie Xiao-Li, Zhang Hong-Tu (Dept. of Phys., Lanzhou Univ., China).
Acta Phys. Sin. (China), vol.32, no.2, p.182-90 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Plate-form inclusions of shear type represent the mechanical aspect of many important processes, such as the formation of slip bands, twin bands and martensite plates in crystalline materials. All these processes connect closely with fracture of materials. Analytical expressions for stress intensity fators of the crack near the inclusion have been derived by using dislocation theoretical method. Using the results of this paper, some aspects of the cracking due to a plate-form inclusion are discussed. The Hall-Petch relation of twin-fracture stresses can be obtained from the inclusion/ model, and the theoretical results are in good agreement with experiments. (15 refs.)

67103 Fracture of glass, brittle fracture. D.Francois (CNRS, Univ. de Technol. de Compiegne, Compiegne, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.571-80 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Linear elastic fracture mechanics derives from the Griffith's theory of fracture. The state of stress at the tip of a crack is characterized by a single parameter, the stress intensity factor K, which in turn is related to the strain energy release rate G. The fracture energy must be correlated with the structure of the crack tip, yet poorly known. (30 refs.)

67104 Tetragonal distortion and drift flow of solute atoms near a crack tip. Y.T.Chou, M.Gao, M.Lu, R.P.Wei (Dept. of Metall. & Materials Engng., Lehigh Univ., Bethlehem, PA, USA).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.245-55 (April 1983).
The drift flow of solute atoms near the crack tip in a cubic crystal, subjected to mode I, mode II and mode III loading, is analyzed for the case where lattice distortion by the solutes is tetragonal. The results show that the flow pattern is complex and is dependent on the orientation of the crack plane and of the crack front in the crystal. Detailed data for cracks oriented parallel to the (010) and $(1\bar{1}0)$ planes, with the crack front lying along selected directions, are given. Unlike the case of spherical distortion, the drift flow of solutes can occur under mode III loading, except for a few special orientations, in addition to under mode I and II loading. The 'saturation concentration' of solutes near the crack tip also varies with the mode of loading and the orientation of the crack. These results suggest that the potential for hydrogen embrittlement exists under all three modes of loading, in contradistinction to an earlier finding based on considerations of spherical distortion. (23 refs.)

67105 Semiempirical, quantum mechanical calculation of hydrogen embrittlement in metals. M.S.Daw, M.I.Baskes (Sandia Nat. Lab., Livermore, CA, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1285-8 (25 April 1983).
A new, semiempirical model of metals and impurities (embedded atom method) makes possible a static treatment of the brittle fracture of a transition metal in the presence of hydrogen. Results indicate that hydrogen can reduce the fracture stress in nickel. (20 refs.)

67106 Mechanical and physical properties of amorphous solids based on $(CH_3)_2SiO$-SiO_2 gels. H.Schmidt, A.Kaiser, H.Patzelt, H.Scholze (Fraunhofer-Inst. fur Silicatforschung, Wurzburg, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.275-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The influences of reaction conditions and compositions on the physical properties of gels in the system $(CH_3)_2SiO$-SiO_2 were investigated. These materials are prepared by cohydrolysis and cocondensation of $(CH_3)_2Si(OEt)_4$ and were developed for being used as abrasive powders with limited effectiveness. They are applied for cosmetical or medical purposes, e.g. smoothening the human skin. Hydrolysis and condensation are monitored by IR, NIR and MS methods for characterization of the materials SEM, SAXS, BET surface measurement, and a special abrasive test were used. (5 refs.)

67107 Amplitude-dependent ultrasound absorption and acoustoplastic effect during active deformation of sodium chloride crystals. A.B.Lebedev, S.B.Kustov, B.K.Kardashev.
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1798-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3169-71 (Oct. 1982). [received: April 1983]
The authors have simultaneously measured the internal friction, the elastic modulus defect, and the acoustoplastic effect as functions of the amplitude of ultrasonic vibrations at individual points of the deformation diagram during plastic bending of specimens of single-crystal sodium chloride. The ultrasonic vibrations were excited and the internal friction was measured by using the resonance method of a three-component piezoelectric vibrator in a self-excited circuit. (11 refs.)

62.60 ACOUSTIC PROPERTIES OF LIQUIDS

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for second sound in quantum fluids, see 67.40, 67.50 and 67.60)

67108 Speed of sound in superheated organic liquids. R.G.Ismagilov, G.V.Ermakov (Physicotech. Problems in Power Engng., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.561-6 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.677-82 (July-Aug. 1982). [received: April 1983]
A pulse technique at a frequency of 2.5 MHz is used to measure the speed of sound in n-pentane, n-hexane, n-heptane, benzene, acetone, and ether in the temperature internal 100-200°C with transition into the region of metastable states up to 10 atm. It is noted that the speed-of-sound isotherms are continuous in transition across the saturation line. (8 refs.)

67109 Ultrasonic investigation of interactions in mercury. S.Singh Bhatti (Dept. of Phys., Guru Nanak Dev Univ., Amritsar, India), D.P.Singh.
Indian J. Pure & Appl. Phys., vol.20, no.12, p.961-4 (Dec. 1982). [received: April 1983]
Ultrasonic velocities are computed at 12 temperatures and the applicability of some liquid state models to mercury is tested. Jacobson's free length theory (1952) and Schaaff's collision factor theory (1963) as also the relation between sound velocity and latent heat (suggested by Ramachandra Rao and Padmini (1960)) hold fairly well. However, the hard sphere model with attractive interactions holds only partially as the molecules do not have symmetry properties. (24 refs.)

67110 Ultrasonic wave propagation and its relation to molecular relaxation times in some organic liquids. A.V.Narasimham (Dept. of Phys., Indian Inst. of Technol., Madras, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.790-5 (Oct. 1982). [received: April 1983]
Various methods have been proposed and discussed for the determination of the intermolecular relaxation times (pertinent to the highly viscous and associated liquids, in which the structural relaxation dominates) and the intramolecular relaxation times (pertinent to the nonviscous and nonassociated liquids, in which the vibrational relaxation dominates), in terms of the compressibility and bulk viscosity of these liquids and also absorption and dispersion of ultrasonic waves. A relation has been obtained between the intramolecular and intermolecular relaxation times of some organic liquids. The vibrational relaxation time is found to be always greater than the structural relaxation time. The variations of ultrasonic velocity and absorption coefficient with frequency and their values at very low and very high frequencies have been discussed. It is observed that the dispersion of the wave. Approximate calculations indicate that the expressions are fairly valid. (15 refs.)

67111 Temperature dependence of the sound velocity and ultrasonic attenuation in liquid Bi-Ga and Bi-Sn alloys. M.Rosen (Center for Materials Res., Johns Hopkins Univ., Baltimore, MD, USA), Z.Salton.
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.189-94 (April 1983).
The temperature dependence of the sound velocity and ultrasonic attenuation in several liquid Bi-Ga and Bi-Sn alloys was determined by means of an ultrasonic pulse technique. The sound velocity is shown to be linear with temperature and parabolic with concentration in Bi-Sn alloys, and in Bi-Ga alloys in the miscibility region. This behavior indicates a correlation between the behavior of the electrical resistivity and of the sound velocity. A rapid gravitational separation was observed at 262°C for the critical composition in the Bi-43.77 wt.%Ga alloy. Ultrasonic attenuation measurements permitted the accurate determination of the position of the interface (meniscus) between the separated liquid phases. The rate of motion of the meniscus as a function of temperature and composition was measured. The ultrasonic technique is shown to be useful for the accurate determination of phase diagram boundaries in systems with a liquid miscibility gap. (12 refs.)

67112 Ultrasound absorption in polystyrene solutions near the miscibility coexistence curve and critical point. D.B.Fenner (Dept. of Phys., Univ. of Santa Clara, Santa Clara, USA).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.444-6 (4 April 1983).
Ultrasound absorption is reported for solutions of a monodisperse polystyrene. These solutions were studied above the miscibility coexistence curve, for concentrations near and above the critical value. An excess absorption of the Kawasaki-type multiple relaxation was observed. The absorption exhibited a phase-separation, but not a critical-point, anomaly. (10 refs.)

67113 Temperature dependence of hypersonic attenuation in NaCl and KCl crystals. J.-P.Bonnet, M.Boissier, C.Vedel, R.Vacher (Lab. de Spectrometrie Rayleigh-Brillouin, Univ. des Sci. & Tech. du Languedoc, Montpellier, France).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.515-19 (1983).
The usual theories of ultrasonic attenuation (Landau-Rumer and Akhiezer) are in disagreement with experiments involving hypersonic phonons (Brillouin scattering). This is shown here by measurements on NaCl and KCl. The authors observe a T^n dependence with n approximately equal to 2.8, and an attenuation increasing with temperature in the low and high temperature range respectively. An extension of the Landau-Rumer and Akhiezer theories to hypersonic frequencies is proposed. The theoretical expressions give a good account of the temperature dependence of the attenuation in the whole temperature range. (18 refs.)

67114 Acoustic symmetry and the third order elastic constants of tetragonal TII (4/m) crystals. P.Blanchfield, A.J.Miller, G.A.Saunders (School of Phys., Univ. of Bath, Bath, England).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.569-77 (1983).
The mode equations which relate the measured hydrostatic and uniaxial pressure derivatives of the 'natural' ultrasonic velocity to the second and third order elastic constants for the tetragonal TII ($4/m$) Laue group have been transformed from the crystallographic (XYZ) axial frame to a reference frame (κ, $\kappa+\pi/2$, Z) comprised of two acoustic symmetry axes and the fourfold axis. It is found that, if the acoustic symmetry axes do not shift appreciably with pressure, the mode equations for TII crystals in this reference frame are much simpler than those in the crystallographic axial frame (XYZ), having the same form as those for the higher symmetry TI Laue group. Hence 12 transformed third order elastic constants can be obtained experimentally for TII crystals by making measurements of the hydrostatic and uniaxial pressure derivatives of ultrasonic wave velocity of modes propagated in the (κ, $\kappa+\pi/2$, Z) axial set with the uniaxial stresses also applied in this reference frame. The approach has been used to determine the 12 transformed third order elastic constants of scheelite ($CaWO_4$). (15 refs.)

67115 Saturation of relaxation absorption in amorphous metals at very high acoustic powers. W.Arnold (Fraunhofer-Inst. for Non-Destructive Testing, Univ. der Saarbruecken, Saarbruecken, Germany), P.Doussineau, A.Levelut.
J. Phys. Colloq. (France), vol.43, no.C-9, p.553-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Strong non-linear effects recently observed in the acoustic absorption in amorphous PdSiCu and other amorphous metals are explained. The authors propose that saturation of the relaxation absorption due to tunneling sites might occur, when the acoustic power becomes so large that the whole ensemble of two level systems (TLS) is saturated up to energy splittings of the order of kT. (9 refs.)

67116 Elastic anomaly near zero-gap state in narrow-gap semiconductors. K.Kumazaki, Y.Abe (Dept. of Engng. Sci., Hokkaido Inst. of Technol., Sapporo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.438-40 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The sound velocities of $Cd_xHg_{1-x}Se$ narrow-gap semiconductors for $0<x<0.6$ are measured at room temperature. The reduced elastic constants derived from sound velocities show an anomaly near zero-gap point, which is not explained by modified valence-force-field theory. This elastic anomaly is well described by calculation based on the zero-gap properties through dynamic dielectric function and complex band structure. (10 refs.)

67117 Hydrogen motion in single-crystal palladium hydride as studied ultrasonically. R.G.Leisure, T.Kanashiro, P.C.Riedi, D.K.Hsu (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4872-82 (15 April 1983).
The attenuation of ultrasonic waves has been investigated in single-crystal α'-phase palladium hydride ($PdH_{0.64}$) over the temperature range of 77-300K. The longitudinal and two independent transverse waves were propagated along the [110] crystal axis. These correspond to the elastic constants $C_L=1/2(C_{11}+C_{12}+2C_{44})$, $C'=1/2(C_{11}-C_{12})$, and C_{44}. Attenuation peaks were observed for all three modes. At 10 MHz the maxima occurred at approximately 190K for C_L and C', and 180K for C_{44}. The peaks are attributed to a stress-induced ordering of hydrogen pairs and complexes, and vacancy pairs anc complexes, on the hydrogen sublattice. The relative magnitudes of the peaks are well accounted for in terms of hydrogen-hydrogen, hydrogen-vacancy, and vacancy-vacancy interactions at nearest- and next-nearest-neighbor positions. A simple nearest-neighbor interaction is shown to be inadequate to explain the results. The gradients of the hydrogen-vacancy interaction energies at nearest- and next-nearest-neighbor sites are deduced, with the main uncertainty having to do with the selection of an anelastic critical temperature in the theoretical expression. Using 50K for the critical temperature the authors find 5.4×10^{-11} and 3.8×10^{-11} N for the absolute value of the gradients at nearest- and next-nearest-neighbor sites, respectively. The three measured attenuation peaks were found to satisfy a Cauchy-type relationship. Such a relationship suggests a central-force description of the interactions among hydrogen atoms and vacancies. The existence of a hydrostatic mode of relaxation is shown for the first time for this system. The relaxation rate for this mode is approximately the same as that for C_L and C', while the C_{44} mode relaxes approximately twice as fast. Plots of the attenuation times the temperatures versus inverse temperature are asymmetric. The data, taken at higher frequencies and thus higher temperatures, can be fitted using an anelastic critical temperature, but the value is considerably higher than that deduced from the internal-friction experiments. The difference suggests that the asymmetry is not due to a critical temperature, but has some other origin. (32 refs.)

67118 Damping and dispersion of sound at structural transitions. H.Iro, F.Schwabl (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Solid State Commun. (USA), vol.46, no.2, p.205-8 (April 1983).
The attenuation and dispersion of ultrasonic modes in the vicinity of structural phase transitions is studied. The authors perform the first systematic renormalization group calculation of the relevant scaling functions appropriate for perovskites, $n=3$, and for tetragonal systems $n=2$ and 1 with n the number of order parameter components, properly describing the high and low frequency limits. A novel dynamical matching formalism is introduced in the derivation of these results. (18 refs.)

67119 Absorption of ultrasound in diamagnets containing paramagnetic impurities. L.L.Buishvili, N.O.Sepashvili, E.Kh.Khalvashi (State Univ., Tbilisi, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1652-4 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2916-19 (Oct. 1982). [received: April 1983]
A study is made of the interaction of ultrasound with host nuclei in diamagnets diluted with paramagnetic impurities. It is shown that the nuclear line width is governed by the electron dipole-dipole interaction. (10 refs.)

67120 Electric field effect on sound rate in substances with high dielectric constant. A.A.Demidenko, A.P.Zdebskii, V.N.Puskovoi, A.U.Savchuk.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.465-7 (March 1983). In Russian.
The resonance-antiresonance method was used to measure the dependences of sound speed on the constant electric field in substances with high dielectric constant in the case of longitudinal oscillations in a rod in a transverse electric field. The results obtained are compared with curves calculated using results from measuring the second order electrostriction coefficients. (5 refs.) *V.G.P.*

62.80 ULTRASONIC RELAXATION

(see also 74.30G Ultrasonic attenuation in superconductors, 43.35 Ultrasonics)

67121 A continuum mechanical approach to the ultrasonic relaxation of ferrolectric materials. K.Tanaka, M.Tanaka (Osaka Univ., Osaka, Japan).
Arch. Mech. (Poland), vol.34, no.1, p.49-60 (1982).
The ultrasonic relaxation of an electrically polarizable, non-heat conducting, deformable materials is studied at uniform constant temperature below the Curie point from the point of continuum mechanics. The dissipative quantities are assumed to be determined from the dissipation potential, while the reversible quantities are specified, as usual, by the free energy. The relaxation time and the equation for the phase velocity are derived. The theory is applied to tryglycine sulfate, in order to discuss in detail the relaxation phenomena as well as the ultrasonic absorption. (17 refs.)

67122 Acoustic relaxation in a mixture having a lower critical solution point. Yu.S.Manutcharov, I.G.Mikhailov, V.A.Solov'ev, R.K.Turniyazov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.88-91 (Feb. 1983). In Russian.
Using reverberation and pulse methods an ultrasonic absorption has been measured in 2,6-lutidine-water mixture at critical concentration in the frequency range 05 to 1000 MHz. A single curve for reduced absorption vs. reduced frequency has been obtained which shows the rearrangement in concentration fluctuations to be the main relaxation mechanism. An additional irreducible relaxation process has been found at low frequencies and temperatures. It can be attributed to complex formation. No measurable contribution of entropy fluctuations to sound absorption has been found. (9 refs.)

63.10 GENERAL THEORY

67123 Dynamical structure factor of a one-dimensional harmonic liquid: comparison of different approximation methods. G.Radons, J.Keller, T.Geisel (Inst. fur Theoretische Phys., Univ. Regensburg, Regensburg, Germany).
Z. Phys. B (Germany), vol.50, no.4, p.289-96 (1983).
The authors calculate the dynamical structure factor of a linear chain of particles with harmonic interactions, a model which is frequently discussed for $Hg_{3-\delta}AsF_6$ and superionic conductors. $S(q,\omega)$ either consists of a quasielastic peak or of an inelastic peak with finite halfwidth. Based on numerically exact results they compare different approximation methods—a continued fraction expansion and a mode-coupling approximation. It turns out that at small wave vectors the mode-coupling approach leads to wrong results even qualitatively. Otherwise both methods are well suited to describe the liquid-like behaviour of the system. The authors also present a new method to terminate continued fractions which is able to provide a fast convergence. (17 refs.)

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

67124 Application of the polarisable-ion model on crystals with the corundum structure. H.A.Lauwers, L.Van Haverbeke, M.A.Herman (Lab. Inorganic Chem., Univ. of Antwerp, Antwerp, Belgium).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.489-96 (1983).
Reports the results of charge, polarisability and force constant calculations at $\vec{k}=0$ on crystals with the corundum structure. Published vibrational frequencies are used in the normal coordinate treatment. The calculated electronic parameters are discussed. (36 refs.)

67125 Ab initio determination of static, dynamic and dielectric properties of semiconductors. K.Kunc (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France), R.M.Martin.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.511-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Recent applications of local density functional theory to structure-related properties of semiconductors are reviewed with emphasis upon the authors' own results using the 'direct' method. This approach has provided a unified framework for ab initio calculations for crystals, surfaces, and molecules, with no essential approximations beyond the local form of the density functional. The quantities which have been calculated include the lattice constant, frequencies and pressure coefficients of phonons at high symmetry k-points, eigenvectors of phonon modes, anharmonicity, soft-mode phase transitions, sets of interplanar forces determining entire phonon dispersion branches, and macroscopic dielectric properties including effective charges and static dielectric constants. The results are illustrated and compared with experiment for GaAs. (21 refs.)

67126 The lattice dynamics of substitutional tin on the two different lattice sites in III-V compound semiconductors. G.Weyer, J.W.Petersen, S.Damgaard (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.523-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A site-selective implantation technique has been utilized to incorporate amphoteric tin impurities on the two inequivalent lattice sites in six III-V compound semiconductors. Debye temperatures for ^{119}Sn have been determined by Mossbauer emission spectroscopy. From a comparison of these values to values calculated by means of the mass-defect model on the basis of Debye temperatures for the two host atoms from neutron-scattering experiments, force constants for the impurity atoms have been extracted by an Einstein-Debye Ansatz. Both lower and higher force constants are deduced for the tin impurities as compared to host force constants. Larger force constants are found on V sites than on III sites for tin in gallium compounds, whereas the opposite holds for the indium compounds. (14 refs.)

67127 Measurements of dispersive phonon transport in gallium phosphide. B.Stock, R.G.Ulbrich (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.540-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors present experiments of energy transport by near zone-edge phonons generated in the process of nonradiative e-h pair recombination at T=1.3K in GaP. Their results show ballistic dispersive transport of phonons with frequencies up to 2 THz depending on orientation and distance. (8 refs.)

67128 Effect of anharmonic lattice vibrations on the interaction of spins via a phonon field. A.F.Izmailov, A.R.Kessel' (Physicotech. Inst., Acad. of Sci., Kazan, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1548-50 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2732-7 (Sept. 1982). [received: April 1983]
The potential of an indirect interaction of spins via a phonon field in an anharmonic lattice is derived. It is shown that the lattice anharmonicity contributes to the potential of the indirect interaction of spins via a phonon lifetime τ_{ph}. It is also shown that τ_{ph} appears in the most slowly decaying term of the indirect interaction potential and leads to its exponential cutoff at large distances. The second moment of the magnetic resonance line due to an indirect interaction of spins is calculated including the effect of a finite phonon lifetime. (5 refs.)

63.20D Phonon states and bands, normal modes, and phonon dispersion

67129 Calculation of phonon spectrum using the recursion method. S.Y.Wu (Dept. of Phys., Univ. of Louisville, Louisville, KY, USA), Zheng Zhao-bo.
Acta Phys. Sin. (China), vol.32, no.1, p.46-56 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The phonon spectra of crystalline solids with bcc, fcc and diamond structures were calculated using the recursion method. The result of the calculation demonstrated the feasibility of this method in treating complicated systems. This work also provided a base for applying the method to study the dynamics and electronic structure of amorphous systems. (7 refs.)

67130 Phonon dispersion in rare gas solids. D.Singh, R.P.S.Rathore (Dept. of Phys., RBS Coll., Agra, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.926-9 (Dec. 1982). [received: April 1983]
Four shell models each comprising only four disposable parameters are developed. These parameters defining repulsive, attractive and unpaired interactions are evaluated in terms of the elastic and the equilibrium relations. Cohesion, Cauchy's discrepancy, compressibility, lattice stability and phonon dispersion are explained adequately. (28 refs.)

67131 Elastic anisotropy and phonon dispersion effects in iron and tungsten. S.N.Mehrotra (Dept. of Phys., Regional Inst. of Technol., Jamshedpur, India), S.Tolpadi.
Indian J. Pure & Appl. Phys., vol.20, no.10, p.769-73 (Oct. 1982). [received: April 1983]
A new graded mesh method (GMM) which uses a 91-direction approximation in 1/16th part of the Brillouin zone (BZ) is suggested for evaluating the BZ sums. The BZ is subdivided into three sub zones such that the volumes of the subzone closest to the centre of the zone and the next two subzones are in the ratio 1:124:7875. The wave vectors chosen in these three subzones for the evaluation of the BZ sums are 8736, 8736, and 17472 respectively. A 91-direction approximation is also used to calculate the long wavelength wave velocities and the elastic Debye temperature θ_0 of cubic crystals. The GMM is used to calculate the two parameters α and β which give the percentage effect of phonon dispersion and lattice anisotropy on the lattice specific heat of Fe and W. The calculations show that α is positive and β is negative throughout the temperature range. It is further observed that α shows a maximum and β a minimum when (T/θ_0) is nearly equal to 0.1 and 0.2 respectively. (15 refs.)

67132 Lattice dynamical calculation of the phonon dispersion in sodium halide crystals. R.S.Narayanan, H.C.Gupta, B.B.Tripathi (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.777-9 (Oct. 1982). [received: April 1983]
A lattice dynamical calculation has been presented for the phonon dispersion and the elastic constants of the sodium halide crystals. In addition to the Coulomb interaction, the overlap interaction as derived on quantum mechanical principles has been considered. The combination of electrostatic energy and overlap interaction gives a fairly good account of the shear elastic constant and the phonon spectra of the sodium halides. (14 refs.)

67133 Shift operator techniques for the classification of multipole-phonon states. XI. Properties of mixed type quadratic product operators in R(7). J.Van der Jeugt, H.E.De Meyer, G.Vanden Berghe (Rijksuniv.-Gent Krijgslaan, Gent, Belgium).
J. Math. Phys. (USA), vol.24, no.5, p.1339-44 (May 1983).
For pt.X see ibid., vol.23, p.1223 (1982). Expressions connecting R(3) scalar and nonscalar product operators of the type $P^j_{l+k}O_l^k$ and $O^k_{l+j}P_l^j$ are constructed within the group R(7). (12 refs.)

67134 Shift operator techniques for the classification of multipole-phonon states. XII. O_l^0 eigenstate and eigenvalue determination in R(7). J.Van der Jeugt, G.Vanden Berghe, H.E.De Meyer (Rijksuniv.-Gent Krijgsláan, Gent, Belgium).
J. Math. Phys. (USA), vol.24, no.5, p.1345-9 (May 1983).
For pt.IX see ibid., vol.24, p.1339-44 (1983). On account of previously derived relations between quadratic shift operator products of the type $P^j_{l+k}O_l^k$, $O^k_{l+j}P_l^j$, and $O^k_{l+j}O_l^j$ in the group R(7), part of the eigenvalue spectrum of the scalar shift operator O_l^0 is derived in closed form. The corresponding eigenstates which are closely related to the octupole-phonon state vectors are defined in terms of angular momentum lowering shift operator actions upon the maximum angular momentum states. In the case of l-degenerate state the relation between the previously constructed P_l^0 eigenstates and the derived O_l^0 eigenstates is discussed. A short comment on a numerical method for O_l^0 eigenvalue determination is included. (10 refs.)

67135 Perturbation-theoretical model calculation of the lattice mechanics of low polarisability ionic crystals. D.Bose (Dept. of Phys., Presidency Coll., Calcutta, India), A.Ghosh, A.N.Basu.
Phys. Status Solidi b (Germany), vol.116, no.1, p.313-22 (1 March 1983).
Starting from the Hartree-Fock wave functions of free ions different lattice mechanical properties of a low-polarisability ionic solid, namely the RbF crystal are calculated within the framework of the perturbation-theoretical-model approach of ionic solids developed by Basu and Sengupta (1980). In a recent investigation it is shown that the dipolar polarisation in an ionic solid may be additively decomposed into three parts, two short range polarisation effects and a long range one apart from the displacement polarisation. From an analysis of the Szigeti relations it is found that both the short range polarisation effects in the low polarisability ionic crystals are small compared to those in high polarisability crystals. This fact leads to a major simplification in calculation for this group of solids. The overall agreement obtained broadly justifies the approximations. Since no crystal property is used to obtain the parameter the discrepancies cleary indicate the regions where the omitted interactions are important. Finally a critical analysis of the results is presented and the difficulties of the existing phenomenological models for these solids are also discussed. (22 refs.)

67136 Neutron, X-ray and lattice dynamical studies of paraelectric Sb_2S_3. K.R.Rao, S.L.Chaplot (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India), V.M.Padmanabhan, P.R.Vijayaraghavan.
Pramana (India), vol.19, no.6, p.593-632 (Dec. 1982). [received: April 1983]
Neutron and X-ray diffraction studies of Sb_2S_3 indicate extensive diffuse scattering in the plane perpendicular to the chain axis of polymer-like $(Sb_4S_6)_n$ molecules. The authors have examined the possible dynamical origin by recourse to lattice dynamical studies. Dispersion relation of phonons along the three symmetry directions a^*, b^* and c^* is evaluated based on a lattice dynamical model incorporating Coulomb, covalent and a Born-Mayer-like short range interaction. Group theoretical analysis based on the group of neutral elements of crystal sites (GNES) was essential in order to examine and aid in the numerical computations. The group theoretical technique involving GNES extended to 'pseudo-molecular' systems is also discussed in this context. The phonon dispersion relation shows that there are rather flat TA-TO branches of very low frequency in the a and c directions which may give rise to diffuse scattering. The branches along the b-axis are quite dissimilar to those along a and c axes because of anisotropy. Variation of the potential parameters leads to instability of the lowest TA-TO branch. This is suggestive of a temperature or pressure-dependent phase transition. (35 refs.)

67137 Lattice dynamics of black phosphorus. A.Morita, C.Kaneta, H.Katayama-Yoshida (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.517-19 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A force-constant model calculation of the phonon dispersion and frequency distribution function of black phosphorus, which is a narrow-gap and layer-like semiconductor, is presented. In calculation, the authors assume the valence force model for intralayer atomic interactions and the axially symmetric force model for interlayer ones. The calculated results explain experiments on optical phonons, specific heat and second-order Raman spectrum satisfactorily and sound velocities semi-quantitatively. Large discrepancy between theory and experiment on the linear compressibilities exists. (17 refs.)

67138 Lattice vibrations of thin ionic slabs of GaAs. G.Kanellis, J.-F.Morhange, M.Balkanski (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.534-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors calculate the lattice vibrations of thin ionic slabs of GaAs on the basis of a rigid-ion model fitted on the phonon dispersion curves of the infinite crystal. Long-range forces are recalculated and a Valence Force-Field model is used as an intermediate step to calculate the short-range interaction of atoms lying near the surfaces. For sufficiently thick slabs (~20 layers), they find that all optic and acoustic modes fall on the dispersion branches of the infinite lattice, while the four surface modes have frequencies in the gap at the corresponding zone edge point. The results are discussed in comparison with former calculations. (3 refs.)

67139 Microscopic calculation of the phonon frequencies of silicon, including exchange and correlation. P.E.Van Camp (Univ. of Antwerpen, Antwerp, Belgium), V.E.Van Doren, J.T.Devreese.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.537-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Phonon frequencies of Si are calculated in the dielectric screening theory. Electron energies and wavefunctions are obtained from a self-consistent pseudopotential band calculation. The lattice constant is evaluated from minimalization of the total ground state energy. In order to guarantee consistency exchange and correlation are treated in the local density functional formalism both in the Hamiltonian and in the linear response theory. Results of the Γ, X and $\vec{q}={}^{2\pi}/_{a}$ (0.4,0,0) phonons are presented and compared with earlier calculations. (13 refs.)

67140 Raman probe of the large wavevector TA phonon bottleneck in GaAs. K.T.Tsen, D.A.Abramsohn, R.Bray (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.543-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have probed the modes, frequencies and populations of nonequilibrium large wavevector TA phonons in GaAs, participating in the bottleneck in decay at low temperature. The excess phonons were generated as a by-product of intense pulsed Nd:YAlG laser excitation of electrons from deep traps, and were probed in situ by 90° second-order Raman scattering of the same laser beam.

67141 Lattice dynamics of graphite intercalation compounds. F.Batallan, I.Rosenman, Ch.Simon (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France), H.Lauter, G.Furdin.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.614-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have studied using coherent inelastic neutron scattering, the phonon dispersion relation of the second stage bromine graphite intercalation compound. They have observed the almost complete low energy spectrum (<12 THz) with longitudinal and transverse phonons propagating along the direction perpendicular to the layers (c axis) as well as in the layers' plane. The modes polarized along the c axis present energy gaps in the c direction branches and the acoustic branch polarized in the layers' plane, opposite to the optic ones, is very sensitive to the intercalate nature. The main character of the modes polarized in the layers' plane is a dispersionless optic branch along the c direction at 1 THz. A phenomenological Born-von Karman force constant model with nonaxial symmetry is developed in order to interpret the results. (8 refs.)

67142 Pressure dependence of the optical phonon in solid hydrogen and deuterium up to 230 kbar. R.J.Wijngaarden, V.V.Goldman, I.F.Silvera (Natuurkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands).
Phys. Rev. B (USA), vol.27, no.8, p.5084-7 (15 April 1983).
The authors have studied the E_{2g} transverse-optical phonon by means of Raman scattering in solid molecular hydrogen and deuterium at pressures up to 230 kbar at 5K in a diamond anvil cell. With the use of a self-consistent phonon calculation which incorporates anharmonic corrections to the self-energy, phonon frequencies were calculated using an isotropic intermolecular pair potential. Deviations between theory and experiment point to deficiencies in the potential. The present experimental data can be used as a test on the isotropic part of the intermolecular potential of the solid. (17 refs.)

67143 Lattice dynamics in second-stage bromine-graphite intercalation compound. C.Simon, F.Batallan, I.Rosenman (CNRS, Paris, France), H.Lauter, G.Furdin.
Phys. Rev. B (USA), vol.27, no.8, p.5088-97 (15 April 1983).
The authors have studied by coherent inelastic neutron scattering the phonon spectrum of a second-stage bromine-graphite intercalation compound. The intercalate sample was obtained from highly oriented pyrolytic graphite. They have observed the almost complete low-energy (<12 THz) phonon spectrum with longitudinal and transverse phonons propagating along the *c* direction as well as in the layer plane. They have observed three branches polarized along the *c* axis which present energy gaps a long the *c* direction. The acoustic branch propagating in the layer plane contrary to the optic ones is very sensitive to the intercalate. The main character of the modes polarized in the layer plane is the dispersionless optic branch along the *c* direction at 1 THz. A phenomenological Born-von Karman force-constant model with nonaxial symmetry, developed in order to interpret their results, explains them very well. (22 refs.)

67144 Long-wavelength vibrations in $Pb(MoO_4)_x(WO_4)_{1-x}$ solid solutions. V.M.Nagiev, Sh.M.Efendiev, N.G.Darbishov, N.N.Mel'nik (S.M. Kirov State Univ., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1630-1 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2872-4 (Sept. 1982). [received: April 1983]
The results of a Raman spectra study are presented in order to explain the long-wavelength vibrations in $Pb(MoO_4)_x(WO_4)_{1-x}$ solid solutions. The authors give the dependence of the phonon frequencies on solid solution composition and conclude that the highest frequency phonons reveal a double mode behaviour. (8 refs.)

67145 Phase diagram of one-dimensional electron-phonon systems. II. The molecular-crystal model. J.E.Hirsch (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), E.Fradkin.
Phys. Rev. B (USA), vol.27, no.7, p.4302-16 (1 April 1983).
For pt.I see ibid., vol.27, p.1680 (1983). The authors study the nature of the ground state of a one-dimensional electron-phonon model for molecular crystals. The phonons are assumed dispersionless and couple to the local electronic density. They consider the half-filled-band sector and discuss the stability of the Peierls-dimerised ground state as a function of the phonon frequency (ω), electron-phonon coupling constant (λ), and number of components of the electron spin (n). First, they discuss the properties of the model in the limiting cases of zero frequency and infinite frequency. They then perform a strong coupling expansion which maps the system onto a spinless fermion model with nearest-neighbour repulsion for both spinless and spin-$^1/_2$ electrons, but with different parameters in both cases. Finally, they perform a numerical study of the system using a Monte Carlo technique. They study the behaviour of the order parameter and of correlation functions for various points in parameter space. They also perfrom a finite-size—scaling analysis of the numerical data. The conclusions of the study are the following: For the case of spinless electrons, there exists always a disordered phase for small coupling constant, and the system undergoes an infinite-order transition to a Peierls-dimerised state as the coupling constant increases beyond a critical value. The phase diagram is divided between a disordered and an ordered region by a line that connects the points ($\omega=0$, $\lambda=0$) and ($\omega=\infty$, $\lambda=\infty$). For the case of spin-$^1/_2$ electrons, the system is dimerised for arbitrary λ and ω except in the limit $\omega=\infty$. (28 refs.)

67147 Linear dispersion of transverse high-frequency phonons in vitreous silica. M.Rothenfusser, W.Dietsche, H.Kinder (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Phys. Rev. B (USA), vol.27, no.8, p.5196-8 (15 April 1983).
Using phonon interference in thin films, the authors have measured the dispersion curve of transverse phonons in vitreous silica. A linear dispersion was found up to 450 GHz. This result has important implications for theories on the specific heat and thermal conductivity of glasses and is consistent with recent model calculations of phonons in a glass. (17 refs.)

67148 Lattice dynamics and conjugation length in trans-polyacetylene. L.Piseri, R.Tubino, L.Paltrinieri (Istituto di Chimica delle Macromolecole, CNR, Milano, Italy), G.Dellepiane.
Solid State Commun. (USA), vol.46, no.2, p.183-8 (April 1983).
A force field for the infinite trans-polyene chain which includes the contribution of delocalized forces is proposed. Phonon energies throughout the Brillouin zone are evaluated and compared with the IR and Raman data of trans-polyacetylene and with the C=C stretching frequencies of a number of short polyenes. The experimental resonant Raman bandshapes for $(CH)_x$ and $(CD)_x$ are well accounted for by the calculated dispersion of the phonon frequencies. Some conclusions on the conjugation length of the polymer are reached. (22 refs.)

63.70 STATISTICAL MECHANICS OF LATTICE VIBRATIONS

(see also 65. Thermal properties of condensed matter, 66.70 Thermal conduction)

67149 Estimation of the Debye temperature of diamond-like semiconducting compounds from bulk moduli and microhardness. P.Deus, H.A.Schneider (Sektion Phys., Bergakad. Frieburg, Frieburg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.491-500 (1983).
The reliability of estimations of the Debye temperature θ_D evaluated from bulk moduli and microhardness data is proved for semiconductors with diamond, sphalerite, and chalcopyrite structures. The known linear relations available from the literature do not yield a reasonable agreement between experimental and calculated Debye temperatures. As in the case of the Lindemann rule a better approximation is obtained by use of a more general relation $\theta_D=\alpha_1 x+a_2$. The constants a_1 and a_2 are calculated for the substances under consideration. Unknown Debye temperatures are calculated. (31 refs.)

67150 Theory of anharmonicity in the lattice dynamics of crystals of rigid molecules. S.H.Walmsley (Chem. Dept., Univ. Coll. London, London, England).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.491-8 (15 April 1983).
The use of the rigid-molecule approximation in the theory of lattice dynamics of molecular crystals leads to higher-order kinetic energy terms when anharmonic effects are allowed for. The conventional theory of lattice dynamics is extended to take account of these terms. (4 refs.)

67151 Nonlinear lattice dynamics in two dimensions. D.C.Mattis (Phys. Dept., Univ. of Utah, Salt Lake City, UT, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5158-61 (15 April 1983).
In general, dynamical and quantum-mechanical properties of anharmonic lattices are best expressed in terms of bond variables. A transformation from atomic (site) to bond coordinates is generated in two dimensions, with the help of a number of subsidiary conditions expressed on plaquettes. It is shown that these commute with the Hamiltonian and yield a number of zero-energy modes. With the use of this trick, two-dimensional problems are now only slightly more difficult to study than one-dimensional analogs. The authors discuss some exact results. (7 refs.)

67152 Anisotropy of molecular oscillations as a factor in forming partially ordered structures. V.K.Pershin, Vl.K.Pershin (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1739-41 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3074-8 (Oct. 1982). [received: April 1983]
The analysis of the dynamical equations for a two-dimensional layered molecular crystal is used as the basis for classifying mesophases according to how the lattice dynamically loses its stability. The authors demonstrate the fundamental possibility for forming a partially ordered structure resulting from a mixed translational-librational instability. (25 refs.)

64.00 EQUATIONS OF STATE, PHASE EQUILIBRIA, AND PHASE TRANSITIONS

(see also 82.60 Chemical thermodynamics)

64.10 GENERAL THEORY OF EQUATIONS OF STATE AND PHASE EQUILIBRIA

67153 The critical points of cubic equations of state for pure fluids. M.A.J.Michels, H.Meijer (Koninklijke/Shell-Lab., Amsterdam, Netherlands).
Fluid Phase Equilibria (Netherlands), vol.11, no.1, p.19-27 (April 1983).
The critical point of an equation of state for a pure fluid generally has to be calculated from three coupled relations between the critical constants V_c, p_c and T_c. It will be shown that for any cubic equation of state these relations may be decoupled in such a way that only one relation for T_c has to be solved, whereupon V_c and P_c follow by direct substitution. For cubic equations with a Van der Waals-type repulsive term a second form of the solution is given. As examples the equations of Redlich and Kwong (1949), of Ishikawa, Chung and Lu (1980), and of Kumar (1980) are considered. (9 refs.)

67154 A four-parameter equation of state. Y.Adachi, B.C.-Y.Lu (Dept. of Chem. Engng., Univ. of Ottawa, Ottawa, Ontario, Canada), Hidezumi Sugie.
Fluid Phase Equilibria (Netherlands), vol.11, no.1, p.29-48 (April 1983).
A new equation of state which contains four parameters and remains cubic in terms of volume has been developed and successfully applied to the representation of properties of pure components (compressibility factor, fugacity coefficient, enthalpy departure, vapor pressure, and saturated liquid and vapor volumes) and mixtures (vapor-liquid equilibria and compressibility factor). The pure component parameters have been evaluated on the basis of optimal representation of the critical isotherm, and correlated in terms of critical temperature, critical pressure and the acentric factor. The mixing rules used include only one binary interaction parameter, the values of which have been obtained for twenty-six binary mixtures. (50 refs.)

64.30 EQUATIONS OF STATE OF SPECIFIC SUBSTANCES

(see also 65.70 Thermal expansion)

67155 Equation of state for fluid hydrogen-isotopes H_2, D_2, and T_2 up to their freezing points at 300K. H.Shimizu, T.Kumazawa (Dept. of Electrical Engng., Gifu Univ., Gifu, Japan).
J. Chem. Phys. (USA), vol.78, no.7, p.4632-6 (1 April 1983).
The calculations of the *P-V* isotherms of fluid hydrogen isotopes H_2, D_2, and T_2 up to their freezing pressures around 55 kbar at 300K have been performed by using the modified hard-sphere variational perturbation theory with a quantum correction for four kinds of intermolecular potentials. The results by the use of the potentials of Silvera-Goldman (1978) and Nellis et al. agreed well with the experimental equation of state. The quantum pressures (ΔP) were estimated as a function of volume for H_2, D_2, and T_2 at 300 and 200K, and the dependences of ΔP on volume, molecular mass, and temperature were discussed. (25 refs.)

67156 T-P-C state diagram of the V-Mn system in the ordering range. A.K.Butylenko, I.Yu.Ignat'eva.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.461-3 (March 1983). In Russian.
The temperature dependence of electrical conductivity of V-Mn alloys with Mn concentration between 20-60 at.% were used to construct a T-P-C state diagram upto 80 kbar. It is shown the ordering temperature T_c sign change with pressure is determined by the sign of the relative alloy volume change during ordering $\Delta V/V_0$ (ΔV—volume difference between ordered and disordered phases). The quantity dTc/dp depends on the degree of alloy deviation from equal-atom composition for which $\Delta V/V_0$ is a maximum. (9 refs.)

64.60 GENERAL STUDIES OF PHASE TRANSITIONS

(for critical phenomena in quantum fluids, superconductors, magnetic materials and ferroelectrics, see 67., 74.40, 75.40 and 77.80 respectively)

67157 A statistical theory of the Collins' model in the phase transition of two-dimensional system. Du Yi-jing, Chen Li-rong, Yan Zu-tong (Dept. of Phys., Anhwei Normal Univ., Wuhu, China).
Acta Phys. Sin. (China), vol.32, no.1, p.96-102 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
By using the Collins' model, Kawamura (1980) had studied the phase transition of a two dimensional system. In this work, taking into account the molecular fraction and the presence of the 4-atom, the authors calculated the Gibbs free energy and studied, the influence of the percent of 4-atom on the parameters of the triple point and the critical point. They obtain a phase diagram showing three phases with a triple point and a critical point. The relation between the extent of each phase and the temperature is calculated along each transition line. The obtained results are quite analogous to the behavior of the three-dimensional substances. (4 refs.)

67158 Computer coupling of phase diagrams and thermodynamics. A.D.Pelton (Ecole Polytech., Montreal, Quebec, Canada).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.183-8 (March 1983).
There has been much progress in the coupling of thermodynamics and phase diagrams. The development of solution models, of analytical and numerical techniques, and of computer software has now advanced sufficiently that it is possible to express the Gibbs energies of a wide variety of phases as functions of the state variables and to calculate multicomponent phase diagrams therefrom with good pecision for many systems. This approach presents several advantages. Thermodynamic data and phase diagram measurements for a system can be critically assessed simultaneously. Once a set of thermodynamic functions has been compiled for a system, these can be extrapolated to calculate phase diagrams ouside the ranges of *T*, *P*, composition, partial pressures, etc. of the measurements, or to compute metastable phase boundaries. *N*-component phase diagrams can be estimated from the properties of their (*N*-1)-component sub-systems. (23 refs.)

67159 On diffuse phase transitions and hybrid crystal formation. A.J.Burggraaf (Dept. of Chem. Engng., Twente Univ. of Technol., Enschede, Netherlands).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.208-13 (March 1983).
A review and short discussion is given of a particular type of phase transition called a diffuse phase transition and of microstructures which may give rise to it. Special attention is paid to microdomains and hybrid crystal formation. Experimental evidence from literature is reviewed. Results on some ferroelectric and ion conductive materials are summarised and discussed in more detail. (49 refs.)

67160 Kinetics of a unidirectionally inhomogeneous Ising alloy. C.M.van Baal (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.218-21 (March 1983).
A new way of treating kinetic problems in crystalline systems, applied earlier to homogeneous systems (Physica, vol.111A, p.591, 1982), here is applied to the Hillert model of an alloy i.e. to a model in which it is assumed that inhomogeneities in composition only exist in one crystal direction. For this model the diffusion equations are derived and shown to lead to equilibrium. The equations are solved in linear approximation. The solutions are unstable inside the spinodal and have characteristics that are in very good agreement with the Cahn-Hilliard theory of spinodal decomposition. (13 refs.)

67161 Irradiation-driven phase transformations in alloys. H.Wollenberger (Hahn-Meitner-Inst. fur Kernforschung Berlin, Berlin, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.229-32 (March 1983).
Energetic particle irradiation produces supersaturation of vacancies and interstitials. The migrating defects annihilate at internal sinks and surfaces forming fluxes to the annihilation sites. Such defect fluxes may cause atomic redistribution in alloys due to an inverse Kirkendall effect. Local instability of the solid solution and precipitation may result. This mechanism is not confined to defect annihilation at sinks but might operate also for vacancy interstitial recombination. An entirely different mechanism of phase transformation is induced by the atomic mixing effect occurring within the irradiation produced atomic collision cascades. Long range ordered precipitations can be dissolved that way. (17 refs.)

67162 Cooperative phenomena: a simple model for phase transitions in solid electrolytes. A.Bunde (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.240-4 (March 1983).
The influence of cooperative effects on the transitions of ionic crystals to a highly conductive solid electrolyte state is investigated within the framework of a simple model describing one type of ions as a lattice gas in a vibrating cage formed by the other type of ions. The formation of a solid electrolyte is interpreted as an order-disorder phenomenon among the lattice gas ions. At low temperatures these are localized at certain lattice sites, while at high temperatures they are distributed over numerous interstitial sites. According to the number of equivalent and nonequivalent interstitial sites and, in particular, depending on the mutual interactions among the ions, the following transitions to the solid electrolyte state may occur: (I) gradual transitions, (II) one transition of first order, and (III) two successive transitions of first order. (30 refs.)

67163 Functional integral approach to the Falicov-Kimball model. H.S.Wio (Centro Atomico Bariloche, Bariloche, Argentina).
Z. Phys. B (Germany), vol.50, no.4, p.357-61 (1983).
Using the functional integral method of Hubbard-Stratonovich, the author has studied the existence of first order phase transitions in the Falicov-Kimball model. By means of two different approximation he has obtained results at variance. The first approximation, that is called uniform, is like a mean field one; and the second, a self-consistent one, is similar to the coherent potential approximation. (12 refs.)

67164 The choice of composition variable comparing the Walker and Vause model to binary liquid mixtures having closed-loop coexistence curves. R.G.Johnston, M.R.Meadows, R.C.Mockler, W.J.O'Sullivan (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.575-8 (22 April 1983).
By using unconventional composition variables, the authors have extended the application of the Walker and Vause model (1980) to include binary liquid mixtures having highly asymmetric closed-loop coexistence curves. They offer a plausibility argument supporting the use of these composition variables. (24 refs.)

67165 A molecular theory for the freezing of hard spheres. A.D.J.Haymet (Dept. of Phys., Harvard Univ., Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4641-8 (1 April 1983).
Using statistical mechanics and a series of well-defined approximations the author presents a calculation of the equilibrium liquid to solid transition for hard spheres. No computer simulation results are used. The transition is located from structural information about the liquid using a first-principles order parameter theory of freezing. The order parameters are the coefficients of a Fourier expansion of the spatially varying single-particle density $p(\mathbf{r})$ in terms of the reciprocal lattice vectors of the solid. The thermodynamic and structural properties are calculated from a perturbation expansion in $p(\mathbf{r})$. The effects of second order terms in this expansion and intermediate wavelength properties are investigated for the first time. The theory predicts that the equilibrium freezing transition occurs from a liquid with density 0.976 to an fcc solid of density 1.035 (in units of σ^3, where σ is the hard sphere diameter), in good agreement with monte Carlo simulations which find empirically that the liquid at a density 0.939-0.948 has the same pressure and free energy as the solid at a density 1.036-1.045. (32 refs.)

67166 Gas bubble formation in nonequilibrium water-gas solutions. Ho-Young Kwak, R.L.Panton (Mech. Engng. Dept., Univ. of Texas, Austin, TX, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5795-9 (1 May 1983).
The paper concerns the nonequilibrium situation that is created by suddenly reducing the pressure of a liquid which contains a large amount of dissolved gas. A theoretical model for the resulting formation of gas bubbles is presented. For a given temperature, the model predicts the amount of pressure reduction required for the threshold of bubble formation and also the reduction required for massive bubble formation. With a few extra assumptions the model will also describe the temperature dependence of these pressure reductions. Results from the model show good agreement with experiments for various gases dissolved in water solutions. (18 refs.)

67167 Group-subgroup phase transitions, Hermann's space-group decomposition theorem, and chain subduction criterion in crystals. S.Deonarine, J.L.Birman (Dept. of Phys., City Univ. of New York, New York, NY, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4261-73 (1 April 1983).
Direct determination of allowed continuous symmetry-breaking transitions among crystallographic space groups is systematised by using the decomposition theorem of Hermann (1929), according to which every subgroup of a space group is a class-equivalent (Klassengleich) subgroup of a translation-equivalent (Zellengleich) subgroup of the parent group. The theorem provides a structure in the lattice of maximal space subgroups of a parent space group needed for studies of phase transitions between a space group and its space subgroups. With the use of this structure, a systematic application of the chain-subduction criterion is facilitated. The direct group-theory procedures are illustrated by obtaining all allowed continuous transitions from the parent space group $C_{4h}{}^6$ to any of its space subgroups. Results agree with Lyubarskii's (1960) calculation except in one case where agreement can be obtained by extending Lyubarskii's analysis to include terms of higher (eighth) degree in the Landau free energy. 67170 Enthalpies of compounds with compositions close to M_5Ge_3 (M=Mn, Fe, Co, Ni) in temperature interval 500-1400K. Yu.V.Putintsev, A.G.Gofman (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Inorg. Mater. (USA), vol.18, no.5, p.680-3 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.809-11 (May 1982). [received: Feb. 1983]
In adiabatic mixing calorimeters, in an interval of temperatures from 500 to 1400K, the temperature dependence of enthalpy $\Delta H_{298.15}{}^{T}$ has been obtained for the germanides $Mn_{1.67}Ge$, $Fe_{1.76}Ge$, $Co_{1.75}Ge$, and $Ni_{1.86}Ge$, and their heats of fusion have been evaluated. The values established for the heats of fusion are very much different from those calculated by the additivity rule and are also very much different from the heats of fusion of other germanides and silicides that are similar to these germanides in structure. (14 refs.)

67171 Colling rate dependence of the icer I nucleation temperature in aqueous LiCl solutions. D.R.MacFarlane, R.K.Kadlyala, C.A.Angell (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.235-8 (20 Jan. 1983).
The cooling rate dependence of the homogeneous nucleation temperature, T_h, has been determined for several compositions in the system $LiCl/H_2O$. This cooling rate dependence was found to be small except at concentrations close to the edge of the glass-forming range. An explanation of the often observed termination of the T_h curve at $\sim T_g+22K$ is developed. Little prospect is found of improving the vitrification range of cryoprotectant solutions by the imposition of high quench rates. (17 refs.)

67172 Solidification of the Al-In monotectic alloy in a horizontal Bridgman configuration. I. Experimental aspects and structure characterisation. B.Vinet, C.Potard (Dept. de Metall., CENG, Grenoble, France).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.355-61 (March 1983). In French.
The authors report the results of the solidification of Al-In monotectic alloys carried out by the horizontal Bridgman method. These experiments demonstrate that natural convection plays a favourable prominent part in the growth of regular monotectics. They show that it is possible to obtain regular structures (fibres or globules) in massive samples by using low thermal gradients ($\sim$25K cm^{-1}). In particular, original structures have been obtained. They characterize the structures by measuring their geometrical parameters and by seeking their correlations. (15 refs.)

64.70F Liquid-vapour transitions

67173 Evaporation of a highly superheated liquid. A.A.Samokhin, A.B.Uspenskii (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.599-605 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.718-24 (July-Aug. 1982). [received: April 1983]
The special features of the surface evaporation of a liquid under the action of a concentrated energy flux are theoretically investigated. It is shown that strong superheating is manifested in a distinctly nonmonotonic behaviour of the evaporation pressure, varying from a curve with a single peak to weakly decaying nonlinear oscillations, depending on the intensity of the acting factor. The peak width and the period of the pressure oscillations depend on the size of the energy-release region. The oscillatory evaporation regime occurs in a relatively narrow range of intensity in which the behavior of the thermophysical parameters of the superheated metastable phase is rather singular. (24 refs.)

67174 Physicochemical properties, critical temperatures, and evaporation enthalpies of alkylalkoxysilanes and arylalkoxysilanes. I.A.Lavygin, I.I.Skorokhodov, O.V.Leitan, Yu.L.Balukov, K.M.Dubinina (State Res. Inst. for Chem. & Technol. of Organometallic Compounds, USSR).
Inorg. Mater. (USA), vol.18, no.5, p.696-700 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.829-34 (May 1982). [received: Feb. 1983]
A systematic study was carried out for the temperature dependence of the density, surface tension, and viscosity of a series of alkyl- and arylalkoxysilanes. An empirical relationship was proposed for calculating the density of these homologous series using the molecular mass and number of carbon atoms in the alkoxy group. A refined value was found for the Si-C_{aryl} bond increment for calculation of the parachor or organosilicon compounds. Critical temperatures and, for some of the compounds, evaporation enthalpies were calculated. The interrelationship of physicochemical properties with the structure of the alkyl and alkoxy groups was examined. The feasibility of describing the temperature dependence of the viscosity of low-molecular-weight organosilicon compounds using the free volume concept was demonstrated. Values were given for constants of the Fulcher-Tamman equation which permit calculation of the viscosity of alkyl- and arylalkoxysilanes in a broad temperature range (down to the glass transition temperature). (6 refs.)

67175 Condensation diagram for thin films of CdS_xTe_{1-x} solid solutions. V.Ya.Vityuk, V.A.Sanitarov, I.P.Kalinkin, N.N.Zapleshko (Lensovet Leningrad Technol. Inst., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.951-4 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1126-9 (July 1982). [received: Feb. 1983]
The phase composition of thin films consisting of CdS_xTe_{1-x} solid solutions on orienting and nonorienting bases is determined by their condensation and decomposition kinetics: at condensation rates greater than the rate of thermoactivated decomposition (at high supersaturations), one-phase films are formed in the entire range of compositions of the CdS-CdTe system. In the opposite case, under condensation conditions closer to equilibrium, a two-phase $\alpha_1+\alpha_2$ film is formed. The condensation diagram was given for CdS_xTe_{1-x} solid solutions on mica. The condensation diagrams of cadmium and zinc sulfotellurides and selenotellurides should have an analogous form. (6 refs.)

67176 Changes in the composition of hyperstoichiometric uranium dioxide during evaporation. Yu.G.Godin, A.N.Bakhteev.
Inorg. Mater. (USA), vol.18, no.7, p.995-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1179-83 (July 1982). [received: Feb. 1983]
A method of calculating the rate of evaporation and the rate of change of composition of hyperstoichiometric uranium dioxide during isothermal holding at high temperature in vacuum has been developed. The results of the calculations agree with the experimental data obtained when $UO_{2.0562}$ is evaporated at 1403-1469K. (13 refs.)

67177 Heterogeneous bubble nucleation and conditions for growth in a liquid-gas system of constant mass and volume [bone cell application]. C.A.Ward, W.R.Johnson, R.D.Venter, S.Ho (Dept. of Mech. Engng., Univ. of Toronto, Toronto, Ontario, Canada), T.W.Forest, W.D.Fraser.
J. Appl. Phys. (USA), vol.54, no.4, p.1833-43 (April 1983).
The conditions are considered under which heterogeneous bubble nucleation takes place in a conical pit in the boundary of a constant size volume containing a liquid-gas solution, and the size to which the nucleate bubble grows is predicted. Four possible equilibrium states are found for the nucleate bubble: two unstable, one metastable, and one stable. The unstable state corresponding to the smallest equilibrium size is the one that acts as the threshold size that must be exceeded in the nucleation event. The metastable and second unstable state are encountered as the nucleate bubble emerges from the conical pit and the stable state corresponds to the largest equilibrium size. It arises from the bubble being in a finite volume with fixed mass. The pressure produced in the volume by the growth of the bubble depends on the final state it attains (i.e. either the metastable or stable state). The theoretical expressions obtained from the analysis are applied to predict the conditions under which bubble nucleation and growth take place within a type of bone cell, and the results are used to explain certain types of damage to the bone of animals undergoing decompression from high pressures that have been previously reported in the literature. The expressions are also applied to predict the superheat necessary to produce bubble emergence from a conical pit and are shown to be in agreement with results previously reported. (23 refs.)

67178 Entropy of vaporization at the boiling point. K.Shinoda (Dept. of Appl. Chem., Yokohama Nat. Univ., Yokohama, Japan).
J. Chem. Phys. (USA), vol.78, no.7, p.4784 (1 April 1983).
The empirical relation that the entropy of vaporization at the boiling point is nearly constant for normal liquids, is known as Trouton's rule (1884). In 1915 Hildebrand wrote 'The entropy of vaporization is the same for all normal liquids, not at their boiling points as in Trouton's rule, when vaporized to the same concentration of vapor.' In 1978, Hildebrand said in his monumental address as follows; In the index to the recent book, there are eight references to Trouton's rule, and the value of the 'Trouton constant' is given as 85 ± 10 JK^{-1}. Science advances by discarding its mistakes, such as Ptolemy's epicycles, phlogiston, caloric, lumiferous ether, artiads, and perissads, polywater (and Trouton's rule?). Hildebrand's rule is certainly more accurate than Trouton's rule. But, the boiling point is a preferable temperature for an empirical rule, and the critical pressures of most normal liquids

fall within 50±20 atm, which means that reduced pressure and temperature are nearly constant at respective boiling points. Since vaporization is regarded as solution in vacuum, the entropy of vaporization to the same concentration at the same reduced temperature will be constant for normal liquids. Hence it is preferable to use the concept of the Hildebrand rule to revise Trouton's rule. (9 refs.)

67179 A pseudoatom theory for the liquid-vapor interface of simple metals: computer simulation studies of sodium and cesium. M.P.D'Evelyn, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5225-49 (15 April 1983).
The paper describes a theory of the structure of the liquid-vapor interface of simple metal. The atomic motion is described by an effective Hamiltonian for the ions in an inhomogeneous metal. The 'pseudoatom' Hamiltonian is derived by evaluating the electronic free energy of the metal to second order in the electron-ion pseudopotential. The model is completed by an approximate treatment of the metal-nonmetal transition which must occur in the traversal of the liquid-vapor interface. Using the derived effective Hamiltonian, Monte Carlo simulations of liquid sodium and cesium have been carried out. The Monte Carlo algorithm used is much more sophisticated than that employed in conventional simulations of liquids since the effective ion-ion interaction is density and position (relative to the surface) dependent, and therefore must be recalculated with each Monte Carlo displacement to insure convergence to a self-consistent effective Hamiltonian and density distribution. Monte Carlo simulations of bulk liquid sodium and cesium yield pair correlation functions which are in excellent agreement with experimental data. The simulations of the liquid-vapor interface reveal considerable structure, in the form of stable density oscillations extending several atomic layers into the bulk liquid; the spacing characteristic of this structure is about one atomic diameter. (126 refs.)

67180 Nucleate boiling in drag-reducing polymer solutions. D.D.Paul (Battelle-Columbus Labs., Columbus, OH, USA), S.I.Abdel-Khalik.
J. Rheol. (USA), vol.27, no.1, p.59-76 (Feb. 1983).
Nucleate boiling curves for aqueous solutions of drag-reducing polymers have been measured experimentally. The polymers examined are a galactomannan polysaccharide (Galactasol 211), a polyacrylamide (Separan MGL), two polymers consisting of both acrylamide and acrylic acid monomers (Separan NP-10P and Separan AP-30), two polyethylene oxides (Aldrich No. 18202-8 and No. 18946-4), and three hydroxyethyl celluloses (Natrosol 250MR, 250HR, and 250HHR). The boiling curves have been measured using an electrically heated platinum wire submerged in a saturated pool of liquid at atmospheric pressure. Polymer concentration corresponding to relative viscosities of 1.01, 1.04, 1.08, 1.16, and 1.32 have been tested. The observed changes in the nucleate boiling curves for polymer solutions are in qualitative agreement with those predicted by the Rohsenow pool boiling correlation. In particular, the temperature shifts in the boiling curves are predicted adequately based only on how the polymers change the solution surface tension and, more importantly, the solution viscosity. 64.70H Solid-vapour transitions

67181 Sublimation behavior of molybdenum oxides. Y.Ikeda, H.Ito, T.Mizuno, K.Amioka, G.Matsumoto (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan).
High Temp. Sci. (USA), vol.16, no.1, p.1-22 (Feb. 1983).
The sublimation and decomposition of Mo oxides, such as MoO_2, MoO_3, and Mo_4O_{11}, were studied by high temperature mass spectrometry. Partial pressures of various vapor species including polymeric molecules were reinvestigated for MoO_2 and MoO_3, and newly studied for Mo_4O_{11} by this technique. Heats of reactions over these oxides at measured temperatures T were obtained by the Second Law method and compared with previous data. Estimated thermodynamic functions for the gaseous polymeric species were used to obtain heats of reactions at 298K. For MoO_2 and MoO_3, reasonable partial pressures and heats of reactions for various species were obtained. The heats of sublimation for polymeric $(MoO_3)_2$ and $(MoO_3)_3$ obtained by the Second and Third Law methods at 298K were in good agreement. The vapor species over Mo_4O_{11} were the same as those over MoO_3, but the magnitudes of the various partial pressures were appreciably lower for Mo_4O_{11} than for MoO_3. (19 refs.)

67182 The retarded sublimation of red phosphorus. B.de Largy, A.Finch, P.J.Gardner, N.Kell (Chem. Dept., Royal Holloway Coll., Egham, England).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, no.2, p.383-90 (Feb. 1983).
Vaporization coefficients for red phosphorus (form IV) were determined to the range 620-690K at phosphorus saturation ratios (p^*/p^0) of 0.08-0.29 and in the presence of nitrogen at ca. 1 atm. At 650K, $\alpha_v(p^*/p^0=0.18)=2.5\times10^{-8}$. The effect of iodine on the sublimation rate was examined. (26 refs.)

67183 Vapour pressure measurements on amorphous $Ge_{16}Te_{84}$ alloy by Knudsen cell mass spectrometry. C.Bergman, R.Chastel (Centre de Thermodynamique et de Microcalorimetrie, CNRS, Marseille, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.199-203 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The Knudsen effusion method coupled with a mass spectrometer is a well-known method often employed in metallurgy to study the chemical equilibria in heterogeneous systems. The purpose of this work is to perform measurements of the vapour pressure of tellurium on $Ge_{16}Te_{84}$ amorphous alloys, obtained by liquid quenching. Experiments were performed in the temperature range $370<T/K<650$ yielding the variation of the vapour pressure on the amorphous alloys (T<Tg-410), on the supercooled alloys ($<g<T<T_x$) as well as on the crystalline ones ($T>T_x=500$). At $T/K=400<Tg$, the vapour pressure of tellurium is much higher than over the crystalline sample of the same composition. (16 refs.)

64.70J Liquid-liquid transitions

67184 Thermal expansion and pressure dependence of the critical temperature near the critical solution point of benzonitrile-isooctane. B.C.Miller, E.A.Clerke, S.C.Greer (Univ. of Maryland, College Park, MD, USA).
J. Phys. Chem. (USA), vol.87, no.6, p.1063-6 (17 March 1983).
The authors have measured the mass density as a function of temperature at a near-critical composition in the one-phase region above the upper critical solution point of benzonitrile-isooctane. The measurements indicate a decrease in the density near the critical point and therefore a negative anomaly for the thermal expansion, $\alpha_{p,x}$. This negative anomaly is in agreement with the negative value for the pressure dependence of the critical temperature, dT_c/dP, which has also been determined for this mixture. It is found that $dT_c/dP=-(11.8\pm0.5)\times10^{-8}$ K/Pa. The measurements indicate that this negative anomaly in $\alpha_{p,x}$ will be less than the background positive $\alpha_{p,x}$ until the reduced temperature $(T-T_c)/T_c$ is 2×10^{-13}. (26 refs.)

An apparatus for the investigation of low-temperature, high-pressure, vapor-liquid and vapor-liquid-liquid equilibria ....See Entry 66449

64.70K Solid-solid transitions

(see also 61.50K Crystallographic aspects of polymorphic and order-disorder transformations, 81.30H, 81.30K, 81.30M Microstructures developed by solid-solid phase transformations)

67185 Calorimetric and other studies of phase transitions in solids. H.Chihara (Dept. of Chem., Osaka Univ., Toyonaka, Japan).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.188-93 (March 1983).
Precision calorimetry can provide detailed information about the phase transitions in solids which is utilized to give insight into the nature of transitions and to check the model theories for their validity. Examples of studies are reviewed in this vein on the soft librational mode transition in p-chloranil, the orientational glass transition in carbon monoxide, and the order-disorder transition in hydrogen halides. (28 refs.)

67186 Differential scanning calorimetry (DSC) at pressures up to 5 kbar. Configurational contributions of transition entropies in the plastic crystals cyclohexane and diamantane. R.Sandrock, G.M.Schneider (Lehrstuhl fur Phys. Chem., Univ. Bochum, Bochum, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.197-201 (March 1983).
A method of extrapolating configurational entropies from high pressure DSC data is described. The method allows the separation of configurational entropies from entropy changes due to the volume changes of the transitions. The results on the solid-solid transitions in the plastic crystals cyclohexane and diamantane are discussed with respect to the number of possible molecular orientations. Contrary to literature data rather small numbers are found that can be more easily discussed with consideration of the geometrical parameters of the molecule and the crystal lattice. (19 refs.)

67187 Phase transitions and incommensurability in crystalline model bilayers. R.Kind (Lab. fur Festkorperphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.248-54 (March 1983).
Crystalline layer structure compounds containing aligned aliphatic chains show essentially the same phase transition behaviour as lipid bilayers in liquid systems. This is demonstrated on two representatives of the $(C_nH_{2n+1}NH_3)_2MCl_4$ family ($n=10$, M=Cd and $n=3$, M=Mn) and on one compound of the $C_nH_{2n+1}NH_3Cl$ family ($n=10$). Transitions from completely ordered closely packed structures to disordered states with 'melted' chains, transitions from intercalated to nonintercalated structures, as well as modulated ('ripple') phases can be observed in these model bilayers. A phenomenological description of these transitions is given in the framework of the Landau theory. (19 refs.)

67188 An X-ray diffraction study of lattice compression and phase transition of crystalline phosphorus. T.Kikegawa, H.Iwasaki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.158-64 (1 April 1983).
Polycrystalline phosphorus has been compressed with sodium chloride as an internal pressure marker in an X-ray diamond-anvil cell. A two-step structural phase transition, orthorhombic→rhombohedral and rhombohedral→simple cubic, has been confirmed. While the rhombohedral (*A*7) structure, found to be common to the Group V*b* elements, forms only in a limited range of pressure, from 5.5 to 10 GPa, the simple cubic (primitive) structure is shown to remain quite stable on compression and no indication of a third transition is detected up to 32 GPa, the highest pressure attained. A least-squares fitting of the lattice-compression data to the Murnaghan equation gives the bulk modulus and its pressure derivative for the three polymorphic phases respectively as follows: 36±2 GPa and 4.5±0.5, 46±4 GPa and 3.0±0.6 and 95±5 GPa and 2.1±0.8. An atomistic model of the first transition between the orthorhombic and rhombohedral structures is proposed and compared with that of the second transition. The stability of the simple cubic structure in the Group V*b* elements under high pressure is discussed. (21 refs.)

67189 Low temperature structural and magnetic properties of $PrPb_3$. M.Niksch, W.Assmus, B.Luthi (Phys. Inst., Univ. Frankfurt Main, Frankfurt, Germany), H.R.Ott.
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.688-98 (1982).
Measurements of elastic constants and thermal expansion on a single-crystal specimen identify the low-temperature phase transition of $PrPb_3$ at 0.37K as a Jahn-Teller type structural transition. Additional neutron-scattering experiments on the same sample confirm the nonmagnetic character of the transition. Large precursor effects in the thermal expansion indicate that structural deformations probably develop at temperatures well above the cooperative transition temperature, a phenomenon which may be a rather general feature of structural phase transitions. (17 refs.)

67190 A new method to determine structural domains. H.Tietze, M.Mullner (Inst. fur Kernphys., Univ. Frankfurt am Main, Frankfurt, Germany), H.Jex.
J. Phys. C (GB), vol.16, no.12, p.2209-16 (30 April 1983).
A new method to determine the volume distribution of structural domains is presented. The scattering intensities of fundamental Bragg reflections are analysed. The theory applies to all phase transitions which exhibit structural domains. Thus, there is a subgroup relation between the low- and high-temperature symmetry. The knowledge of both structures and the temperature-dependent order parameters are required. The method is applied to the structural phase transition of the perovskite $KMnF_3$. (22 refs.)

67191 Polymorphism in organo-metallic bidimensional structures: the bis (n-octylammonium) tetrachlorocadmate. N.B.Chanh, Y.Haget, C.Hauw, A.Meresse, L.Ricard, M.Rey-Lafon (Univ. de Bordeaux, Talence, France).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.589-94 (1983).
Raman spectra, X-ray diffraction diagrams and differential scanning calorimetry show the existence of two structural phase transitions in crystalline $(C_8H_{17}NH_3)_2CdCl_4$. The solid stable at low temperature is ordered, and the alkylammonium chains are in an extended configuration with probably a gauche bond in the proximity of the NH_3 group. The intermediate phase is characterized by a conformational disorder and a modification of the crystalline structure. The number of internal rotations increases in the high temperature form; however, the total transition entropy is lower than the value expected for a total 'melting' of the chains. (15 refs.)

67192 Pressure-induced disproportionation in CuBr. E.F.Skelton, S.B.Qadri, A.W.Webb, R.G.Ingalls, J.M.Traquada (Stanford Synchrotron Radiation Lab., Stanford Univ., Stanford, CA, USA).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.441-3 (4 April 1983).
CuBr has been pressurized to 8.3 GPa in four separate runs. Prima facie evidence of pressure-induced disproportionation of cuprous bromide into cupric bromide has been observed on release of pressure from 7 GPa. Evidence is also seen of a phase change in $CuBr_2$ above 5.5 GPa. (18 refs.)

67193 Dipolar reorientation and order-disorder behaviour of pure and mixed alkali cyanides. F.Luty, J.Oritz-Lopez (Phys. Dept., Univ. of Utah, Salt Lake City, UT, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1289-92 (25 April 1983).
A simple empirical relation connects the critical temperature of the order-disorder transition T_c to the dipolar reorientation rate $\tau^{-1}(T)$ of CN^- molecules by the concept of a critical reorientation rate $\tau_c{}^{-1}(T_c)$. This relation is derived from experimental data on four pure alkali cyanides, the dipole-diluted $(KBr)_{1-x}$:$(KCN)_x$ system, and the mixed alkali cyanides $(KCN)_{1-x}$:$(NaCN)_x$ and $(RbCN)_{1-x}$:$(KCN)_x$. The observed disappearance of the order-disorder transition at a certain x value occurs in all mixed systems, when the spread of relaxation rates exceeds a particular value. (14 refs.)

67194 Density-functional theory applied to phase transformations in transition-metal alloys. J.W.D.Connolly, A.R.Williams (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5169-72 (15 April 1983).
A new theory of cluster expansions has been derived, which allows one, for the first time, to estimate the energy of a disordered system from first principles. The cluster variables are derived from a series of density-functional calculations on ordered compounds. The disordering temperatures calculated with this theory show the correct trends for binary alloys of 4*d* transition metals, and are in excellent agreement with the experimental phase diagrams in most cases. (22 refs.)

67195 X-ray evidence of a structural phase transition in di-tetramethyltetraselenafulvalenium perchlorate [$(TMTSF)_2ClO_4$], pristine and slightly doped. J.P.Pouget, G.Shirane, K.Bechgaard (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France), J.M.Fabre.
Phys. Rev. B (USA), vol.27, no.8, p.5203-6 (15 April 1983).
Diffuse X-ray scattering studies of the quasi-one-dimensional conductor di-tetramethyl-tetraselenafulvalenium perchlorate [$(TMTSF)_2ClO_4$], both in its pristine form and when slightly doped with the sulfur analog tetramethyltetrathiafulvalene (TMTTF), reveal the formation of a low-temperature superstructure, which may involve an ordering of the ClO_4 anions. Superstructure reflections are characterized by the unexpected wave vector $\vec{q}=(0,{}^1/_2,0)$, which might also be stabilized under pressure in the superconducting salts $(TMTSF)_2ReO_4$ and $(TMTSF)_2FSO_3$. The occurrence of a phase transition at 24K in pristine $(TMTSF)_2ClO_4$ provides a clue for the understanding of the dependence on the cooling rate of the electronic ground state of $(TMTSF)_2ClO_4$. (26 refs.)

67196 Low temperature phase diagram of the A15 compounds and the tetragonal-to-tetragonal phase transition of $Nb_2Sn_{1-x}Sb_x$. A.F.Khoder (CENG, Grenoble, France), J.Labbe.
Solid State Commun. (USA), vol.46, no.2, p.91-3 (April 1983).
The recent experimental results obtained by Fujii et al. (1982) and concerning the sign of the tetragonal distortion and the tetragonal-to-tetragonal phase transition (from $\epsilon<0$ to $\epsilon>0$) observed in the A15 pseudobinary alloy $Nb_3Sn_{1-x}Sb_x$ are accounted for by considering the effect of the number of carriers Q on the temperature dependence of the coefficients of the 2nd and 3rd order terms in a Landau type free energy expansion. The calculations carried out with the Labbe-Friedel density of states model enable the authors to draw a low temperature phase diagram which appears to be in good agreement with the existing experimental data for $Nb_3Sn_{1-x}Sb_x$ and V_3Si. (7 refs.)

67197 Unusual sequence of commensurate-incommensurate phase transitions observed in $KLiSO_4$. C.H.A.Fonseca, G.M.Ribeiro, R.Gazzinelli, A.S.Chaves (Dept. de Fisica, Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
Solid State Commun. (USA), vol.46, no.3, p.221-5 (April 1983).
An unusual structural phase transition sequence is observed in $KLiSO_4$ by EPR: high temperature prototype phase—incommensurately modulated phase—commensurately modulated phase—incommensurately modulated phase—low temperature prototype phase (reentrant phase). The low temperature phase has the same symmetry $C_6{}^6$ of the high temperature prototype phase. The main feature of the modulation are rotations of the sulphate tetrahedra, which were precisely determined in the commensurately modulated phase. (10 refs.)

67198 A neutron scattering study on the incommensurate-commensurate $\varepsilon\rightarrow\zeta$ phase transiton of the perovskite-type layer compound PAMC: A lock-in phase transition with a flipping modulation vector. W.Depmeier (Univ. de Geneve, Geneve, Switzerland), S.A.Mason.
Solid State Commun. (USA), vol.46, no.5, p.409-12 (May 1983).
An elastic neutron scattering experiment between 80 and 120K has further elucidated the ε- and ζ-phases of PAMC and the $\varepsilon\rightarrow\zeta$ phase transition. The temperature dependence of the incommensurate modulation vector $\mathbf{q}=(1/3+\delta)\mathbf{b}^*$ of the ε-phase has been determined near the phase transition. At the phase transition the modulation vector locks in at $\delta=0$, but below the transiton it flips into the $(\mathbf{b}^*-\mathbf{c}^*)$ direction. The symmetry of ζ-PAMC is monoclinic and the *A*-centering of the normal δ-phase is partially recovered. Multiple and reversible twinning occurs. Pronounced discontinuities appear at the phase transition in the lattice parameters and reflection intensities. (8 refs.)

67199 Diffuse scattering and phase transitions in $RbLiSO_4$ investigated by neutron scattering. F.Frey, H.Jagodzinski (Inst. fur Kristallographie & Mineralogie, Univ. Munchen, Munchen, Germany), A.Pietraszko, C.Zeyen.
Solid State Commun. (USA), vol.46, no.7, p.557-60 (May 1983).
Diffuse scattering as well as the behaviour of satellite scattering within the temperature range of phases I, II and III of $RbLiSO_4$ were studied using elastic and inelastic neutron scattering techniques. The diffuse scattering was found to be of elastic or quasielastic origin from 430 up to 570K. A strong temperature dependence of diffuse and satellite scattering related to the phase transitions was observed. Supposing a truly elastic nature, the intensity profiles were tentatively analysed in terms of a static disorder model. Anomalous inelastic scattering at Λ-points due to a soft mode instability has not been detected so far. (13 refs.)

67200 Static properties of $CsliSO_4$ near the ferroelastic phase transition. A.T.Anistratov, A.V.Zamkov, L.A.Kot, I.N.Stolovitskaya, L.A.Shabanova (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1565-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2763-6 (Sept. 1982). [received: April 1983]
The temperature dependence of the birefringence and of the elastic stiffness and compliance constants is measured in the vicinity of the ferroelastic phase transition. A thermodynamic analysis in terms of the Landau theory is carried out. The main characteristics of the thermodynamic potential and the critical exponents are determined. (6 refs.)

67201 . Low-temperature structural transition in strontium tellurite. A.Yu.Kudzin, V.N.Moiseenko, L.Ya.Sadovskaya (State Univ., Dnepropetrovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1607-8 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2837-9 (Sept. 1982). [received: April 1983]
$SrTeO_3$ has symmetry Cc (the α phase) at room temperature. In the vicinity of 70°C (T_{01}) there is a first-order phase transition with a change of symmetry $Cc\rightarrow C2/c$ (the β phase). The authors study the effect of external variables—the electric field and hydrostatic pressure—on the transition temperature T_{01}. Since the changes in the dielectric constant at the phase transition are small, the determined T_{01} by measuring the conductivity σ of the samples in a constant electric field. (8 refs.)

67202 Order-to-order phase transition in alloys with face-centered superstructures. Z.A.Matysina, E.A.Matysina, D.R.Rizdvyanetskii (Dnepropetrovsk State Univ., Dnepropetrovsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.702-6 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.26-30 (Aug. 1982). [received: April 1983]
The possibility of a temperature phase transition from one superstructure in a binary alloy to a superstructure of another type is theoretically considered. A possible phase diagram for these transitions is constructed. (6 refs.)

64.70M Transitions in liquid crystals

67203 Phase transitions in discotic liquid crystals. [NMR observations]. R.Blinc (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.271-4 (March 1983).
The phase diagram of a columnar discotic liquid crystal is evaluated within a Landau theory and the results are compared with the data obtained from ^{13}C NMR measurements on hexapentoxy-triphenylene. (8 refs.)

67204 The polymorphism of 2-n-Nonyl-5-[4-n-butyloxyphenyl]-pyridine. A.Madicke, D.Demus, V.V.Titov, A.I.Pavluchenko, E.I.Kovshev (Sektion Chem., Martin-Luther-Univ. Halle-Wittenberg, Halle, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.K45-7 (1983).
The liquid crystalline polymorphism of 2-n-Nonyl-5-[4-n-butyloxyphenyl]-pyridine was investigated by miscibility experiments. The transition temperature of the substance was determined by means of a polarizing microscope. The smectic modification exhibited a texture with lancets and pseudo π-disclinations. The classification of this smectic modification has been done according to the miscibility criterion. In order to test the behaviour of miscibility in a binary system the diagram of state of a mixture determined by polarized microscopy. (6 refs.)

67205 On the rectangular-hexagonal columnar phase transition in disc-like liquid crystals. C.Destrade, Nguyen Huu Tinh (Centre de Recherche Paul-Pascal, Domaine Univ., Talence, France), J.Malthete, A.M.Levelut.
J. Phys. (France), vol.44, no.5, p.597-602 (May 1983).
The authors report the isobaric binary phase diagram for two disc-like mesogens, hexa-n-octyloxytriphenylene and hexa-n-octanoyloxytriphenylene, which was studied by means of optical texture observations, differential scanning calorimetry and X-ray diffraction measurements. They all confirm the presence of a direct transition between a hexagonal ordered columnar phase and a rectangular disordered columnar phase; this kind of transition is also described in a pure disc-like mesogen: hexa-n-decanoate of truxene. Furthermore, they show, within the binary phase diagram, a strongly non-ideal behaviour with a marked maximum of the spindle between the isotropic and the mesomorphic phase. The existence domain of the hexagonal ordered phase versus temperature and concentration is discussed from a structural point of view. (16 refs.)

67206 Macroscopic dynamics in nematics near the uniaxial-biaxial phase transition. H.Brand (Bell Telephone Labs., Murray Hill, NJ, USA), J.Swift.
J. Phys. Lett. (France), vol.44, no.9, p.L333-7 (1 May 1983).
Based on the derivation of the macroscopic dynamics, the authors present a discussion of possible experiments which probe the macroscopic behaviour of uniaxial nematics close to the transition to the biaxial phase. In particular they propose an experiment to measure the influence of a novel static cross coupling between gradients of the director fluctuations (δn) of the uniaxial phase and the order parameter (ξ_{ij}) of the biaxial phase. (8 refs.)

67207 Glass transition as a function of cooling rate. S.M.Rekhson (General Electric Co., Nela Park, Cleveland, OH, USA), G.W.Scherer.
J. Phys. Colloq. (France), vol.43, no.C-9, p.427-30 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A method is described for calculating structural relaxation in glasses cooled very rapidly. The major obstacle for the calculation was the assumption in the original model of Arrhenius behavior for the equilibrium viscosity. The Macedo-Litovitz hybrid equation is used for the equilibrium viscosity. The glass transition region is shows to shift to higher temperatures and to broaden as the cooling rate increases. Glasses with higher Tg e.g. SiO_2 are shown to have broader glass transition region than glasses with lower T_g but similar activation energy. (5 refs.)

67208 Change in molecular conformation and the nature of the nematic-isotropic-liquid phase transition. E.M.Aver'yanov (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1609-10 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2839-41 (Sept. 1982). [received: April 1983]
The author examines the interaction of the order parameter s with the noncritical conformational degree of freedom of the molecules and analyzes the effect of this interaction on the character of the nematic-isotropic phase transition and on the conformation of the molecules. He examines the mesogenic molecules, for which the conformation of the aromatic framework is characterized by the dihedral angle ϕ between the plane of the π-conjugate fragments. (11 refs.)

67209 On the cholesteric-nematic phase-change transitions in layers with homeotropically orienting surfaces. P.R.Gerber (Central Res. Units, F. Hoffmann-La Roche & Co. Ltd., Basel, Switzerland).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.407-14 (April 1983).
Lattice-model calculations of the energies of surface director-configurations are presented. These configurations mediate between the homeotropic surface conditions and the bulk fingerprint texture of cholesteric layers. Their energy determines the asymptotic behaviour of the cholesteric-nematic threshold field in the limit of thick layers. The dependence of their energies on the elastic constant ratios could be brought into a simple scaling form. This form is in agreement with existing and newly presented measurements. (11 refs.)

64.70P Glass transitions

67210 Glass transition and thermal stability of blends composed of polycarbonate and poly(ethylene terephthalate). M.Mucha (Inst. Polimerow, Politech. Lodzkiej, Lodz, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.27, no.4, p.153-6 (April 1982). In Polish. [received: March 1983]
Dilatometric investigations revealed that blends composed of polycarbonate (Makrolon) and poly(ethylene terephthalate) (Elana) are heterogeneous systems. There exist however interactions of the two components revealed in the changes of the glass transition point, T_g, of both polymers in the blend, their specific heat expansion and thermal stability. The thermogravimetric determinations have shown that blends decompose at a temperature lower than those of both components taken separately and this decomposition is connected with a higher weight loss than that resulting from the additivity of the individual components contribution. This factor can be explained by a negative effect of the products of decomposition of the less stable poly(ethylene terephthalate) on the rate of decomposition of polycarbonate. (16 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

67211 Stability behaviour of mixed conducting solids after applying electrical potential differences—measurements with point electrodes on Ag_2S and Cu_2S. H.Rickert, H.-D.Wiemhofer (Phys. Chem., Univ. Dortmund, Dortmund, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.236-9 (March 1983).
The decomposition of the mixed conducting low temperature phases of Ag_2S and Cu_2S by applying electrical potential differences between two metal electrodes has been investigated. The experimental method is based on the use of a chemically inert point electrode. It is demonstrated that the electrical resistance of mixed conducting solids measured at point electrodes is a sensitive quantity for the detection of the deposition of components or other phases with different stoichiometry during the decomposition process. The results on Cu_2S and Ag_2S show a large difference in the stability behaviour of the two substances. (14 refs.)

67212 Copper precipitation in long-time diffused silicon. R.Gleichmann, U.Mohr, K.Jegerlehner (Inst. fur Festkorperphys. und Elektronenmikroskopie, Akad. der Wissenschaften, Halle, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.297-305 (1983).
The generation of microdefects in FZ-silicon during long-time high-temperature processing, necessary for the production of power devices, has been investigated by etching techniques and transmission electron microscopy. The results prove the defects to be large precipitates, which may generate dislocations and stacking faults. The analysis of Moire fringes and the interpretation of selected area diffraction patterns indicate the material to be CuSi. The experimental findings are interpreted by the help of an extension of the existing model for the copper precipitation process. (6 refs.)

67213 TEM image contrast from clustering in Ga-In containing III-V alloys. J.P.Gowers (Philips Res. Labs., Redhill, England).
Appl. Phys. A (Germany), vol.A31, no.1, p.23-7 (May 1983).
The fine grainy contrast observed in TEM images of the Ga-In containing III-V alloys GaInP, GaInAs, and GaInAsP is interpreted as direct evidence of alloy clustering. A simple model is proposed in which clustering modulates the average lattice spacing throughout the crystal. For a sinusoidal modulation, solutions of the coupled two-beam dynamical diffraction equations in the column approximation shown large intensity fluctuations when the modulation wavelength is comparable to the extinction distance. (13 refs.)

67214 The solubility of noble gases in water and in NaCl brine. S.P.Smith, B.M.Kennedy (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.503-15 (March 1983).
A direct-sampling, mass-spectrometric technique has been used to measure simultaneously the solubilities of He, Ne, Ar, Kr, and Xe in fresh water and NaCl brine (0 to 5.2 molar) from 0° to 65°C, and at 1 atm total pressure of moist air. The argon solubility in the most concentrated brines is 4 to 7 times less than in fresh water at 65°C and 0°C, respectively. The salt effect is parameterized using the Setschenow equation, $\ln[\beta_0{}^i(T)/\beta^i(T)]=MK_M{}^i(T)$ where M is NaCl molarity, $\beta_0{}^i(T)$ and $\beta^i(T)$ the Bunsen solubility coefficients for gas i in fresh water and brine, and $K_M{}^i(T)$ the empirical salting coefficient. Values of $K_M{}^i(T)$ are calculated using volumetric concentration units for noble gas and NaCl content and are independent of NaCl molarity. The measured solubilities can be used to model noble gas partitioning in two-phase geothermal systems at low temperatures. The data can also be used to estimate the temperature and concentration dependence on the salt effect for other alkali halides. (54 refs.)

67215 Segregation, diffusion, and solubility of Sn in CdSb. D.P.Belotskii, A.F.Semizorov, V.V.Gorbunov, M.K.Makhova (Chernovtsy State Univ., Chernovtsy, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.743-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.888-90 (June 1982). [received: Feb. 1983]
The segregation, diffusion, and solubility of tin in cadmium antimonide crystals have been investigated by the labelled-atom technique. The equilibrium coefficients of segregation and the principal diffusion parameters have been determined for the three major crystallographic directions [100], [010], and [001]. The nature of the temperature dependence of tin solubility in the range 150-450°C has been elucidated. (5 refs.)

67216 Solubility of copper in CdSe. A.I.Epik, Yu.A.Varvas (Tallin Polytech. Inst., Tallin, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.757-60 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.904-7 (June 1982). [received: Feb. 1983]
In an investigation of the solubility of copper in CdSe the limits of existence of the main forms of copper in the CdSe-Cu system were determined. In a wide range of values of $p(Se_2)$ and at low p(Cd) the predominant form is Cu_2Se, while the concentration of atomic copper Cu(at) increases with increasing p(Cd). At 1170K and maximum values of p(Cd) the distribution coefficient of copper between CdSe and the alloy Cu_xCd_{1-x} was determined; it was equal to 5.1×10^{-3}, which is evidence of effectiveness of the purification of CdSe from copper by the method of extraction into solution. (10 refs.)

67217 Solubility of In in CdSb. D.P.Belotskii, A.F.Semizorov, V.V.Gorbunov, M.K.Makhova (Chernovitsy State Univ., Chernovitsy, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1034-5 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1227-9 (July 1982). [received: Feb. 1983]
A portion of the phase diagram is investigated in the range of compositions 0-5 at.% In and the boundary of the region of the solid solution of In in CdSb is determined. Phase transformations in the alloys are investigated by differential thermal analysis. In a study of the solubility of In in CdSb standard methods are used, based on measurements of the microhardness, saturation of the surface of crystalline samples with the radioactive isotope ^{114}In during diffusion annealing, and investigation of the microstructure. The experimental data, obtained on the basis of thermal and microstructural analyses, showed that the range of concentrations 0-5 at.% In of the polythermal section CdSb-In under discussion lies in the region of primary crystallization of CdSb. Below 668K, alloys of the system are three-phase. The final crystallization of the alloys occurs at 548K. These results are in good agreement with previous results. (7 refs.)

67218 Segregation of In and Te in CdSb. A.F.Semizorov, V.V.Gorbunov, D.P.Belotskii (Chernovitsy State Univ., Chernovitsy, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1036-7 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1229-30 (July 1982). [received: Feb. 1983]
The segregation of donor impurities of In and Te in CdSb have been investigated. Their mobility in liquid CdSb is determined during the flow of a constant electric current through the crystal-melt boundary. The nature of the distribution of impurities along the ingots was determined by the method of labeled atoms. The isotopes ^{114}In and ^{125}Te were used. To find the effective distribution coefficients k of impurities by the method indicated above, crystals with a uniform average composition distribution were used. On the basis of the data of radiometric analysis of the distribution of the isotopes ^{114}In and ^{125}Te along ingots grown at various rates v, the dependences of the effective distribution coefficients on the rate of displacement of the crystallization front were found. (8 refs.)

67219 Comments on 'Scaling theory and enthalpy of mixing for binary fluids' [and reply]. G.Morrison (Thermophys. Div., NBS, Washington, DC, USA), G.ten Brinke, F.E.Karasz.
J. Chem. Phys. (USA), vol.78, no.7, p.4790-2 (1 April 1983).
In a recent note, ten Brinke and Karasz (ibid., vol.77, no.10, p.5249, 1982) have discussed the character of the enthalpy of mixing for binary mixtures near a critical solution temperature (UCST for an upper temperature and LCST for a lower one). They have shown that many of the qualitative features indicated by the classical model of fluids are retained by the scaling model. The real emphasis, Morrison considers, should not fall on the model but on the stability criterion demanded by the second law of thermodynamics, from which the same conclusions can be drawn. ten Brinke and Karasz reply to Morrison's comments. (9 refs.)

67220 Supercritical extraction at atmospheric pressures. I.Procaccia (Dept. of Chem., Weizmann Inst. of Sci., Rehovot, Israel), M.Gitterman.
J. Chem. Phys. (USA), vol.78, no.8, p.5275-6 (15 April 1983).
The authors show theoretically the sharp rise in solubility near the critical point of a binary mixture. In fact the effect should exist in binary mixtures in much the same way as in pure solvents. (11 refs.)

67221 Demixing of micelles of fluorocarbon and hydrocarbon surfactants. Effects of hydrophobic and hydrophilic groups of hydrocarbon surfactants. N.Funasaki, S.Hada.
J. Phys. Chem. (USA), vol.87, no.2, p.342-7 (20 Jan. 1983).
The mutual solubility limits, x_A and x_B, of a nonionic fluorocarbon surfcatant (NFE) and dodecyl polyoxyethylene glycol ether (DE*m*) and of an anionic fluorocarbon surfactant (NF) and sodium alkyl sulfate (SAS) in micelles were determined by the surface tension method as a function of temperature. (31 refs.)

67222 Hydride stability and band structure of the components in the $Pd_{1-x}M_x$ and $LaNi_{5-x}M_x$ systems. R.V.Bucur, D.Lupu (Inst. of Isotopic & Molecular Technol., Cluj-Napoca, Rumania).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.203-9 (April 1983).
The stability of the metal hydrides of $Pd_{1-x}M_x$ and $LaNi_{5-x}M_x$ systems depends strongly on the nature of the substituent M. The change ΔG in free energy on the formation or decomposition of the metal hydrides depends linearly on the average energy $\langle\epsilon_{LB}{}^M\rangle$ of the lowest band of the substituent (transition metal) and on its concentration x. This linear correlation can be expressed by the empirical equation $\Delta G=\Delta G_A+a(\langle\epsilon_{LB}{}^M\rangle-\langle\epsilon_{LB}{}^A\rangle)x$ where ΔG_a is the change in free energy on hydride formation (decomposition) in the pure metal or the intermetallic compound, a is a constant and $\langle\epsilon_{LB}{}^A\rangle$ is the average energy of the lowest band of the component able to bond hydrogen. In dilute palladium alloys (M≡Au, Ag, Pt, Ir, Rh, V, Cu and Ni) at 298K $\Delta G_{Pd}{}^\beta=-2.25$ kcal $(mol\ H_2)^{-1}$ and $\langle\epsilon_{LB}{}^{Pd}\rangle_\beta=-0.68$ rydbergs for the β hydride, and $\Delta G_{Pd}{}^\infty=3.00$ kcal $(mol\ H_2)^{-1}$ and $\langle\epsilon_{LB}{}^{Pd}\rangle_\alpha=-0.63$ rydbergs for the α phase. In the substituted intermetallic $LaNi_{5-x}M_x$ (M≡Pt, Pd, Ag, Fe, Cu, Co and Cr) at 313K $\Delta G(LaNi_5)=0.70$ kcal $(mol\ H_2)^{-1}$, $\langle\epsilon_{LB}(LaNi_5)\rangle=-0.81$ rydbergs and a is a constant that has different values for 3d, 4d and 5d transition metals. The dependence of ΔG on the band structure of the components (transition metals) is discussed within the framework of the metal-hydrogen bonding mechanism in metal hydrides. (17 refs.)

67223 On the construction of a statistical model for primary solid solutions of hydrogen in the group Va transition metals (vanadium, niobium and tantalum). N.Shohoji (Dept. de Metalurgia e Metalomecanica, Lab. Nacional de Engenharia e Tecnologica Industrial, Sacavem, Portugal).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L27-9 (April 1983).
Demonstrates the significance of the choice of the number of available sites for H per M atom in the construction of statistical models. The H_2 pressure composition-temperature relations for primary solid solutions of H in Ta, Nb, and V are used as examples. (9 refs.)

67224 Behaviour of germanium in phase separable glasses of the system Na_2O-B_2O_3-GeO_2-SiO_2. F.Gauthier, C.Lapeyre, J.Gombert (Thomson-CSF, Orsay, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.253-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The role of GeO_2 in the Na_2O-B_2O_3-GeO_2-SiO_2 quaternary system which presents a spinodal decomposition domain is studied. The physical properties of this system are compared to those of the system without GeO_2. The leaching conditions of these glasses and the coordination of Ge are studied. (5 refs.)

67225 Enthalpies of mixing of ternary systems. III. The system In-Sn-Te. B.Gather, R.Blachnik (Anorganische Chem., Univ.-Gesamthochschule, Siegen, Germany).
Z. Metallkd. (Germany), vol.74, no.4, p.212-15 (April 1983).
For pt.II see ibid., vol.73, p.245 (1982). The enthalpies of mixing of the ternary system In-Sn-Te were determined in a heat flow calorimeter at 1020K. The experimental data are presented in a graph of isoenthalpic lines. These results are compared with ternary enthalpies calculated from the enthalpy data of the three binary systems. The calculations show a ternary excess enthalpy. (12 refs.)

67226 Solid solubility and precipitation of phosphorus and arsenic in silicon solar cells front layer. D.Nobili (CNR, Istituto Lamel, Bologna, Italy).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.410-20
The physical nature of the electrically inactive P and As in silicon is discussed, and the results of experiments performed on specimens doped in a wide range of concentration obtained by ion implantation and laser annealing are reported. Thermal treatments of these alloys provided solid solubility values which correspond to the carrier density in equilibrium with excess dopant. Additional confirmation that the electrically inactive phosphorus and arsenic are a precipitated phase was obtained by the kinetics of the annealing

process. The occurrence of precipitation in an amount consistent with that of the inactive phosphorus was confirmed by TEM examinations using the weak beam dark field (WBDF) technique. The precipitation of arsenic was detected by small angle X-ray scattering (SAXS) which provided also details on the size and shape of the particles. These results clearly contradict the well known models developed to account for the difference between carrier and chemical concentration profiles of P and As. These models hypothesize the formation of a high equilibrium concentration of complex point defects which compensate or make the excess dopant electrically inactive. As a consequence the models for the diffusion of P and As based on the above mentioned hypothesis are also contradicted. The influence of these precipitates on the minority carrier lifetime in the n^+ emitter region and on the conversion efficiency of silicon solar cells is considered, with reference to experimental procedures which reduce the amount of inactive dopant. 64.80 OTHER PHASE PROPERTIES OF SYSTEMS

67227 **Stoichiometric limits of carbon-rich boron carbide phases.** M.Beauvy (Dept. de Technol., CENS, Gif sur Yvette, France).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.169-75 (April 1983).
The stoichiometric boron-to-carbon ratios of various carbon-rich boron carbide phases were investigated. Many powders or sintered pellets were analysed and the total boron, total carbon, free-boron and free-carbon concentrations were measured for each specimen before calculating the stoichiometric ratio. The methods described were applied to a large number of analyses and the standard deviation of the results was evaluated. The stoichiometric boron-to-carbon ratio for carbon-rich boron carbide phases was found to depend on the synthesis conditions. Boron dissolves up to 21.6 at.% C at low temperatures and up to 24.3 at.% C near the melting point. Free carbon is deposited as the result of a solid state phase transformation. The stoichiometry of boron carbide prepared by the magnetothermal reaction is $B_{3.63}C$ (approximately $B_{11}C_3$). Boron carbide produced by arc melting boron oxide and carbon is a solid solution. This single carbide melts congruently at a temperature of approximately 2450°C with a carbon content of 18.4 at.% ($B_{4.45}C$). (29 refs.)

67228 **Time-dependent strandlike domains in the charge-density-wave states of $NbSe_3$: An effect not induced by electric field.** C.H.Chen, R.M.Fleming, P.M.Petroff (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4459-62 (1 April 1983).
The authors have made observations of the strandlike domains associated with the charge-density-wave phase transitions in $NbSe_3$ with electric fields applied along the *b* axis of the crystal. No electric-field-induced changes of the standlike domains were observed suggesting that the time-dependent images observed in $NbSe_3$ by dark-field electron microscopy [K.K. Fung and J.W. Steeds, Phys. Rev. Lett. 45, 1696 (1980)] do not originate from the depinning of charge-density waves by electric fields. The authors note that the time-dependent images are found only in a minority of the samples that they have examined. The origin of the strandlike domains and its time-dependent effect in $NbSe_3$ remains obscure at present despite the thorough understanding of the domain structures of incommensurate charge-density waves in other systems such as $2H$-$TaSe_2$. 67230 The heat capacity of single-crystal praseodymium below 1K. M.Eriksen, E.M.Forgan, C.M.Muirhead, R.C.Young (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
J. Phys. F (GB), vol.13, no.5, p.929-44 (May 1983).
The heat capacity of a single crystal of Pr of high purity (residual resistance ratio 140-150) has been measured from 1K to 20 mK, including measurements with a magnetic field of up to 1 T along [1010]. The principal contributions are an electronic term ($\gamma=20\pm1$ mJ mol^{-1} K^{-2}) and a hyperfine term which in zero field exhibits a second-order phase transition with a critical temperature of 42 ± 2 mK. The application of a field reduces T_c and introduces a large contribution in the region $T>T_c$. The induced atomic moment calculated from these results is in good agreement with the results of neutron diffraction studies below 1K. Calculations have been made of the heat capacity expected from applying the mean-field approximation to the Murao model of a nuclear-induced magnetic phase transition. There is good agreement with experiment both for zero field and in applied fields. The results are consistent with ordering only on hexagonal sites and give the value of the peak ionic exchange interaction to be 90% of critical ($\mu=0.90$). The sizes have been estimated of the pseudo-quadrupole contribution, which is too small to have any substantial effect, and the fluctuation contribution to the heat capacity for $T>T_c$, which is much smaller than the authors observe. (20 refs.)

67231 Heat capacity and medium range order in oxide glasses. N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan).
J. Phys. Colloq. (France), vol.43, no.C-9, p.557-68 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The three-band theory using three characteristic temperatures θ_E, θ_1 and θ_3 has been applied to analyze the existing and new data of low temperature heat capacity of various silicates, borates and germanates in both glassy and crystalline states. The values of θ_E for various modifying cations in glasses were similar to those in crystals. The change in coordination state or short range order of network forming cations was observable in θ_1. The values of θ_3 for some glasses were considerably smaller than those of comparable crystals. These data were used to discuss the randomness or medium range order in glass structure. Furthermore, the applicability of the results to interpret the elastic behavior of glass was presented. (40 refs.)

67232 Calculation of the phonon contribution to the specific heat of an overlayer-film substrate at low temperatures. P.Masri (Lab. d'Etudes des Surfaces, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Solid State Commun. (USA), vol.46, no.7, p.563-7 (May 1983).
Using the Green function method, the author calculates the vibrational specific heat C_v produced by an overlayer-film substrate interface at low temperatures. A variation as T^2 is found and the dependence of C_v upon the film thickness is determined analytically. (8 refs.)

67233 Heat capacity anomalies at the commensurate-incommensurate-normal phase transitions in K_2SeO_4-type crystals. T.Atake.
Solid State Phys. (Japan), vol.18, no.1, p.13-20 (Jan. 1983). In Japanese.
Calorimetric studies on K_2SeO_4, Rb_2ZnCl_4 and Rb_2ZnBr_4 are reviewed with the emphasis on the incommensurate structures, which are well explained by a Landau-type phenomenological theory. (57 refs.)

67234 Determination of the temperature dependence of molar thermal capacity C_m (T, p_{atm}) of $LaNbO_4$. V.B.Glushkova, T.I.Panova (Inst. Chem. Silicates im. I.V.Grebenshchikova, Acad. of Sci., Leningrad, USSR), M.Eliasova, I.Proks.
Silikaty (Czechoslovakia), vol.27, no.1, p.69-72 (1983). In Czech.
On the basis of calorimetrically measured values of molar enthalpy increments $\Delta H_{m,tem}(T,p_{atm})=H_m(T,p_{atm})-H_m(298\ K,p_{atm})$ the temperature dependence of molar thermal capacity of tetragonal lanthanum niobate $LaNbO_4$ was determined within the temperature interval 1592-[illegible] K. The specimen of $LaNbO_4$ was prepared by ignition of niobium and lanthanum hydroxides (maximum temperature 1400°C). The temperature dependence of $\Delta H_{m,tem}(T,p_{atm})$ of the compound was calculated from experimental values. The estimate of standard deviation of the $\Delta H_{m,tem}(T,p_{atm})$ values was $s=2.2$ kJ mol^{-1}. The estimated errors of coefficients a and b: $s(a)=4.0\times10^{-3}$ kJ mole^{-1}K^{-1} and $s(b)=2.8\times10^{-6}$ kJ mole^{-1}K^{-2}. The temperature dependence of molar thermal capacity is given by the equation $C_m(T,p_{atm})=a+bT$ where $a=103.1$ J mole^{-1}K^{-1} and $b=5.06\times10^{-2}$ J mole^{-1}K^{-2}. The results of experimental determination of molar thermal capacity $C_m(T,p_{atm})$ of $LaNbO_4$ according to the present study have contributed to the verification of the method by Landiya (1962) for the calculation of this magnitude. The agreement between the results was satisfactory. (4 refs.)

65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

67235 Prediction of thermodynamic properties of normal paraffins using only normal boiling point. C.H.Twu (Process Simulation Internat., Fullerton, CA, USA).
Fluid Phase Equilibria (Netherlands), vol.11, no.1, p.65-81 (April 1983).
The main objective of this work is to develop a generalized equation of state for normal alkanes from only the normal boiling point. Since the equation of state for normal alkanes is found to be a function only of normal boiling-point temperature, the new correlation should be very useful for correlating departures of other systems from normal-alkane behavior using a normal alkane as a nonspherical reference. The equation of state represents accurately the vapor pressures, densities and enthalpy departures of the vapor, liquid and fluid states as a function only of boiling-point temperature over the entire range of interest for the normal paraffins methane (CH_4) through *n*-hectane ($C_{100}H_{202}$). (44 refs.)

67236 High-temperature enthalpy and heat capacity of calcium zirconate. G.G.Gvelesiani, D.Sh.Tsagareishvili, I.S.Omiadze (Inst. of Metal., Acad. of Sci., Georgian SSR), V.A.Levitskii, P.B.Narchuk.
Inorg. Mater. (USA), vol.18, no.6, p.833-7 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.991-5 (June 1982). [received: Feb. 1983]
A mixing calorimetric method has been used to investigate the enthalpy $H_T-H_{298.15}$, the mean heat capacity $\bar{c}_p$ and the true heat capacity c_p of calcium zirconate $CaZrO_3$ at 298.15-1500 °K. The least squares method has been used to construct interpolation equations for the temperature dependences of these thermodynamic functions. These results have been compared with the literature data. (19 refs.)

67237 Equations for temperature-concentration function of enthalpy and heat capacity of niobium carbide in the homogeneity region. A.G.Turchanin (Kramatorsk Industrial Inst., Kramatorsk, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.962-4 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1140-2 (July 1982). [received: Feb. 1983]
A method has been proposed for experimental data processing whereby equations have been obtained for temperature-concentration functions of enthalpy and heat capacity of niobium carbide; the equations make it possible to determine these functions for carbides of any composition in the homogeneity region at 1300-2200K. In the case of the carbides rich in carbon (from the composition $NbC_{0.9}$ to $NbC_{1.0}$), the equations can be used for calculating enthalpy and heat capacity at 1300-2500K. (11 refs.)

67238 Corrected Debye-Huckel theory of electrolyte solutions. S.Nordholm (Dept. of Phys. Chem., Chalmers Univ. of Technol., Goteborg, Sweden).
J. Chem. Phys. (USA), vol.78, no.9, p.5759-63 (1 May 1983).
A simple correction for the finite size of the ions in the atmosphere is introduced into the Debye-Huckel theory. The main effect is to decrease the repulsion among the counterions and thus increase κ. The internal energy, osmotic coefficient, and activity coefficient in the restricted primitive model are found to agree with simulation results for 1-1 and 2-2 electrolytes qualitatively and often to nearly quantitative accuracy. (21 refs.)

67239 Thermodynamic properties of a square-well fluid in the liquid and vapor regions. D.D.Carley (Dept. of Phys., Western Michigan Univ., Kalamazoo, MI, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5776-81 (1 May 1983).
The thermodynamic properties of a square-well fluid are computed for temperatures below the critical temperature using a perturbation technique. Thermodynamic functions such as pressure, internal energy, and the Helmholtz function are evaluated and compared with computer simulation results. The critical point is found and the liquid-vapor phase diagram is obtained. The perturbation method uses high temperature parametric integral equation results as an original reference system and applied first order perturbation theory to the Helmholtz function. The pair potential (ϕ) is written as the sum of two parts, a reference potential (ϕ_r) and a perturbing potential (ϕ_p) and the separation is established by the relationship $\phi_r=\alpha\phi$ where α is a constant. This separation leads up to a particularly simple method of computing thermodynamic properties when the pressure and internal energy are known along one isotherm. In the case of the square-well potential this approximation leads not only to simple equations but the results also appear to be reasonably accurate. (6 refs.)

67240 Thermodynamic relations between the crystallisation of amorphous alloys (Fe,B) and their preparation by hardening from the liquid state. C.Cunat, J.Charles, J.Hertz, J.M.Dubois, G.Le Caer (Lab. de Thermodynamique Metall., Univ. de Nancy I, Vandoeuvre-les-Nancy, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.191-7 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
This experimental study is based on the enthalpic analysis of the crystallization of fourteen $Fe(1-x)$ Bx amorphous alloys with $0.125\leq x\leq0.25$. The authors show that this system, though it is out of equilibrium, exhibits characteristics of thermodynamic reversibility. They point out the existence of a biphased domain formed from the undercooled liquid during the glass transition. They calculate the free enthalpy of the liquid from data of the phase diagram and from some thermodynamic properties of the solid phases. In order to account for their observations, they propose a simplified model of associations in the liquid phase. (13 refs.)

67241 Electrochemical study of Ti in bromide melts. Peng Ruiwu, Ren Yaocheng (Shanghai Inst. of Metallurgy, Acad. Sinica, Shanghai, China).
Kexue Tongbao Foreign Lang. Ed. (China), vol.27, no.12, p.1292-8 (Dec. 1982).
Bromide melts may be one of the promising salts for the preparation, refinement and regrowth of high melting-point metals and for studying the nature of molten salts. The author presents the electrode potentials of Ti and the equilibrium between Ti^0-Ti^{+2}-Ti^{+3} in bromide melts, with a view to investigating the electrochemical and thermodynamic properties of Ti in alkali bromide melts. 67242 **Dependence of the thermal-expansion coefficients of oxide coatings on the properties of their component ions.** L.A.Shvartsman, V.G.Borisenko (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.85-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.714-15 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The ionic structure of systems which contain acidic and basic oxides and are capable of vitrification is considered. The relation between the apparent molar refraction of oxygen ions in oxide systems and the thermal-expansion coefficient of the coating is noted. (8 refs.)

67243 **Thermal expansion of yttrium vanadate.** N.Rajashekhar Reddy, K.Satyanarayana Murthy (Dept. of Phys., Univ. Coll. of Sci., Calcutta, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.139-40 (April 1983).
The authors have studied the lattice thermal behaviour of yttrium vanadate (YVO_4) at high temperatures. The precision lattice parameters and the coefficients of thermal expansion of YVO_4 are presented. (7 refs.)

67244 **X-ray determination of the thermal expansion of Ti_3Au.** M.S.Reddy, J.Sadanandam, S.V.Suryanarayana (Dept. of Phys., Univ. Coll. of Science, Calcutta, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.166-8 (April 1983).
The authors report their data on the lattice parameters and thermal expansion of the A15 superconductor Ti_3Au between room temperature and 510°C. (21 refs.)

67245 **Lattice thermal expansion of silver metaperiodate.** J.Sadanandam, V.Deshpande, S.V.Suryanarayana (Dept. of Phys., Univ. Coll. of Sci., Calcutta, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.169-70 (April 1983).
The authors describe the results of precision lattice parameter and thermal expansion experiments on $AgIO_4$ and isotype of scheelite in the high temperature range between room temperature and 150°C. (19 refs.)

67246 **Lattice thermal expansion of Nb_3Os.** M.S.Reddy, S.V.Suryanarayana (Dept. of Phys., Univ. Coll. of Sci., Calcutta, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.171-2 (April 1983).
The authors present the results obtained on the precision lattice parameter and thermal expansion of Nb_3Os using X-ray diffraction methods. (12 refs.)

67247 **Thermal expansion of rolled and extruded uranium.** R.W.Logan, D.H.Wood (Materials Sci. Div., Lawrence Livermore Nat. Lab., Livermore, CA, USA).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.233-41 (April 1983).
Reports the results of studies of the thermal expansion characteristics of hot- and warm-rolled α-U plate and hot-extruded pipe. The hot-rolled plate had a high coefficient of thermal expansion (CTE) in the rolling direction and a low CTE in the transverse direction. This trend was reversed in both as-warm-rolled plate and plate that was both warm rolled and annealed. In pipe that was hot extruded at large reduction ratios, the authors were able to correlate the CTE for the extrusion, radial and circumferential directions with the CTE for rolling, transverse and normal directions in the hot-rolled plate. (19 refs.)

67248 **Thermal expansion of oriented poly(methyl methacrylate).** L.-H.Wang, C.L.Choy, R.S.Porter (Polymer Sci. & Engng. Dept., Univ. of Massachusetts, Amherst, MA, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.657-65 (April 1983).
The thermal expansivities along ($\alpha_\parallel$) and perpendicular ($\alpha_\perp$) to the draw direction of poly(methyl methacrylate) (PMMA) with extrusion draw ratios $1 \leq \lambda \leq 4$ have been measured between 150 and 298K. As λ was increased from 1 to 4, $\alpha_\parallel$ decreased 2-3 times, whereas $\alpha_\perp$ increased only 20-35%. The orientation function f calculated from thermal expansivity using the aggregate model is found to change linearly with birefringence, indicating that each property provides a sensitive measure of molecular orientation. For PMMA, however, only thermal expansivity can give an absolute f, with results at 150K in reasonable agreement with previous studies using other techniques. At higher temperature, i.e. above ambient, PMMA side-group motions are excited, expanding volume and calculations based on the aggregate model may not be valid. (28 refs.)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

67249 **Thermogravitational thermal diffusion in binary mixtures of chloroform with acetone, benzene, toluene, and mesitylene.** N.-Y.R.Ma, A.L.Beyerlein (Dept. of Chem. & Geology, Clemson Univ., Clemson, SC, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.245-50 (20 Jan. 1983).
Experimental thermogravitational thermal diffusion studies are reported on chloroform-benzene mixtures at 10, 15, 25, and 35°C and on chloroform-acetone, chloroform-toluene, and chloroform-mesitylene mixtures at 25°C. Thermal diffusion factors (α) are calculated from the data on chloroform-benzene and chloroform-acetone mixtures. For the chloroform-benzene derivative mixtures the products $\alpha\eta D$ (η and D being the viscosity and the diffusion coefficient, respectively) are evaluated. (37 refs.)

67250 **Conductivity of supercooled aqueous potassium chloride solutions to −27°C and 50 MPa.** R.J.Speedy (Chem. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
J. Phys. Chem. (USA), vol.87, no.2, p.320-4 (20 Jan. 1983).
Specific resistivities of 0.1 and 1.0 M aqueous KCl solutions are reported to −27°C and 50 MPa. The atmospheric pressure results, together with literature values in the concentration range 0-1 M and 0-30°C can be represented to within 1 or 2% by $r=r_2(T/T_8-1)^{-\gamma}$, where r the resistivity, $r_2C_{20}=0.1316(1+0.65\ C_{20}{}^{1/2})\ \Omega$ mol dm^{-2}, $T_8=224.8(1-0.035C_{20}{}^{1/2})$K, and $\gamma=1.45$. C_{20} is the molar concentration of the solutions at 20°C. The results are interpreted as supporting the hypothesis that there is a structuring phenomenon in supercooled water which generates long-range correlations. (27 refs.)

67251 **Effect of ethanol on the conductivity of supercooled aqueous potassium chloride solutions.** R.J.Speedy, J.A.Ballance, B.D.Cornish (Chem. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
J. Phys. Chem. (USA), vol.87, no.2, p.325-8 (20 Jan. 1983).
Adding ethanol (up to 3 M) to 0.1 M aqueous KCl solutions increased both the resistivity (by up to 300%) and its anomalous temperature coefficient. The effects were more pronounced at lower temperatures. The temperature dependence of the resistivity can be described by $r=r_2(T/T_s-1)^{-\gamma}$, where s the resistivity, r_2 and γ are constants, and T_s is the temperature at which r extrapolates to infinity. The notion that the 'iceberg' structure induced in water by ethanol may be the same as the structure of the low-density species whose cooperative formation is thought to underlie the above temperature dependence of many properties of pure water is discussed. (28 refs.)

67252 **Multiatomic ion models for interdiffusion of liquid silicates.** Y.Oishi, M.Namba (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).
J. Phys. Colloq. (France), vol.43, no.C-9, p.391-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Interdiffusion profiles of the system $40CaO.20Al_2O.40SiO_2$ (wt.%) at 1370-1550°C were analysed using multiatomic ion models, in which diffusing species were described with unknown structure parameters and the solution of the diffusion equation for multicomponent ionic systems was derived in terms of self-diffusion coefficients of constituent elements. The compositions of the unknown diffusing species were determined by means of best fitting of the theoretically calculated concentrations to experimentally determined profiles. A similar analysis was conducted also for the system $16Na_2O.12CaO.72SiO_2$ at 1200°C to determine the composition of the unknown silicate ion. (4 refs.)

67253 **Self-diffusion coefficient of nematic liquid crystals from diffusion concentration gradient.** H.Hakemi (Dept. of Chem., Duke Univ., Durham, NC, USA).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.35-7 (11 April 1983).
A dynamic study of the mass transport by optical methods provides a new approach to evaluate the nematic self-diffusion coefficient. This value is obtained by extrapolation to $C=0$ in an empirical relation $D_C=D_0\exp(-\beta C)$, where D_C is the mass-corrected impurity diffusion coefficient and C is the local concentration of the diffusion profile. (12 refs.)

67254 Composition of the highly conducting compound in the RbCl-CuCl system. V.S.Shvetsov, V.F.Vybornov, V.V.Ivanov (Sergo Ordzhonikidze Polytech. Inst., Novocherkassk, USSR).
Sov. Electrochem. (USA), vol.18, no.7, p.878-82 (July 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.7, p.986-90 (July 1982). [received: March 1983]
Electric conductivity in the RbCl-CuCl system has been studied previously. Its maximum value of $2.25.10^{-3}\ \Omega^{-1}.\mathrm{cm}^{-1}$ at 298K corresponds to the composition with 0.75 mole parts of copper chloride. This composition was regarded as compound $RbCu_3Cl_4$ with copper ion conduction. Another value, of $3.0.10^{-3}\ \Omega^{-1}.\mathrm{cm}^{-1}$, was obtained by Takahashi et al. 1979 for the maximum conductivity, and ascribed to a compound $Rb_3Cu_7Cl_{10}$ (0.70 mole parts of copper chloride). It is doubtful that two compounds with similar conductivities will exist at once in this system. The authors performed studies to clarify the composition of the highly conducting compound and determine the conductivity. (5 refs.)

67255 Electrical conductivity of melts in the system $CaO\text{-}MgO\text{-}SiO_2$. T.Licko, V.Danek (Inst. of Inorganic Chem., Centre of Chem. Res., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Silikaty (Czechoslovakia), vol.27, no.1, p.55-62 (1983). In Czech.
Electrical conductivity of melts in the system $CaO\text{-}MgO\text{-}SiO_2$ was measured within the temperature range of 1670 to 1920K. The temperature dependence of conductivity was described by a second order polynomial. On the assumption that only the Ca^{2+} and Mg^{2+} cations take part in the charge transfer, the dependence of conductivity on composition can be described by an equation related to the limit concentraton of conductive particles at which the melt conductivity approaches zero. The limit concentration c_i° in the systems $CaO\text{-}SiO_2$ and $MgO\text{-}SiO_2$ was found to correspond to the mean concentration value in the immiscibility region. The multiple linear regression function $\chi=f(c_i)$ was used for determining the values of mobility and diffusion coefficients for the Ca^{2+} and Mg^{2+} cations at 1773K and 1873K. It was found that both the mobility and diffusion coefficient of Ca^{2+} are higher than that of Mg^{2+} which may be explained by a higher ionic field strength and thus a stronger Me-O bond in the case of Mg^{2+} cations. 66.20 DIFFUSIVE MOMENTUM TRANSPORT

(inc. viscosity of liquids)

67256 Viscosity properties of solutions of polyvinylbutyl ether of atactic and isoatactic structure. L.I.Shakhovskaya, O.G.Kuznetsova.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.2, p.94-5 (1983). In Russian.
A study was made of the influence of the structure (degree of stereoregularity) of solutions of polyvinylbutyl ether in methylethylketone, with atactic and isotactic structures, on the viscosity characteristies of the solutions. It is concluded that existing information does not permit an unambiguous interpretation of the influence of stereoregularity on the viscosity and activation characteristics of solutions and melts of polymers. (8 refs.) *A.J.B.*

67257 Shear viscosities away from the melting line: a comparison of equilibrium and nonequilibrium molecular dynamics. B.L.Holian (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), D.J.Evans.
J. Chem. Phys. (USA), vol.78, no.8, p.5147-50 (15 April 1983).
Doubts about the validity of the nonequilibrium molecular dynamics (NEMD) methods of computing shear viscosity have persisted, partly because of the apparent disagreement (~25%) between NEMD and equilibrium Green-Kubo (GK) results for the Lennard-Jones system near its triple point. This region of the phase diagram near the melting line is the so-called 'molasses' regime where the tail of the shear-stress autocorrelation function is quite large, deviating from 'exponential' decay at a level of about 10%. In order to see whether the effects of the 'molasses tail' might be obscuring a more profound difference between NEMD and GK results, the authors have carried out independent NEMD and GK calculations for a state in the LJ fluid far away from this troublesome molasses region, namely at a temperature twice critical and a density between the triple and critical points. They find the NEMD and GK results for the linear shear viscosity to be in good agreement. (11 refs.)

67258 Viscous flow and relaxation phenomena in inorganic glass. M.Hara (Asahi Glass Co., Tokyo, Japan).
J. Phys. Colloq. (France), vol.43, no.C-9, p.431-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A model for molecular rearrangement in a continuous viscous medium is proposed and used for analyzing experimental data on stress and structural relaxation of highly quenched glasses below the transformation range. The analysis reveals that the apparent activation energy of viscosity of glass having a constant fictive temperature decreases with falling temperature in contrast to the Arrhenian behavior of viscosity of stabilized glass in a high viscous range. (12 refs.)

67259 Pre-vitrification viscosity enhancement by longitudinal mode coupling. T.Geszti (Res. Inst. for Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary).
J. Phys. Colloq. (France), vol.43, no.C-9, p.435-7 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A mechanism is described for the viscosity of a simple liquid to grow as $\eta\alpha(T\text{-}T_0)^{-1}$ at some finite T_0. It consists of two main steps: 1) a slowing-down of diffusion-controlled structural relaxation of density fluctuations as $\eta\rightarrow\infty$; 2) an enhancement of viscosity by mode-mode coupling to longitudinal modes which are slowly relaxation in view of 1). (16 refs.)

67260 Viscosity of some glassy minerals. Y.Shiraishi, R.Meister (Vitreous State Lab., Catholic Univ. of America, Washington, DC, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.447-50 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A parallel plate viscometer was constructed by utilizing the combination of a linear variable differential transformer and a microcomputer. The characteristic of this viscometer was determined by the measurement of the viscosity of NBS reference glass 711. The results show that the viscometer was suitable for the measurement of the viscosity range from 10^6 to 10^{10} poise. The dynamic method, which can cover a wide range of viscosity by one measurement run, gives a slightly higher value of viscosity than that of the static method. The viscosity of glassy silicate minerals were measured up to 1100°C by the dynamic method. Some minerals showed clearly the change of viscosity on the viscosity vs. temperature curve which indicates the crystallization of the glass. (3 refs.)

67261 Theory of the effective viscosity of magnetofluids. II. Contribution of anisotropy to the effective viscosity. V.M.Suyazov.
Magnetohydrodynamics (USA), vol.18, no.3, p.211-20 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.3-13 (July-Sept. 1982). [received: April 1983]
For pt.I see Magn. Gidrodin, no.3, p.3-13, 1982. In part I the author formulated a system of equations for a ferrocolloid with allowance for the finite relaxation time of the magnetization and the anisotropic properties of the medium. He determined the anisotropy parameter in the equation of state for the magnetization as a function of the crystalline anisotropy constant of a uniaxial ferromagnet, the particle geometrical anisotropy constant, and the presence of chain aggregates in ferrofluids. He investigates the contribution of anisotropy to the effective viscosity. (no refs.)

66.30D Theory of diffusion and ionic conduction in solids

67262 Quantum diffusion at intermediate temperatures. M.Lagos (Facultad de Fisica, Univ. Catolica de Chile, Santiago, Chile).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.47-51 (11 April 1983).
A new closed-form expression for the diffusion coefficient, valid in a wide range of temperatures (including the intermediate ones), is obtained in the framework of the theory of quantum diffusion. The new formula fits well the available experimental data on μ^+ diffusion in Cu in the whole temperature range. The origin of the discrepancies of previous theoretical expressions with high temperature measurements are explained in detail. (6 refs.)

67263 Variants of the same model for solute diffusion by the interstitial dumb-bell in the FCC lattice. J.L.Bocquet (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France).
Philos. Mag. A (GB), vol.47, no.4, p.547-77 (April 1983). In French.
Two variants of the same basic model for solute diffusion by the interstitial dumb-bell mechanism are presented. The pure and mixed dumb-bells are allowed to jump to a nearest-neighbour position by the usual mechanism (combining a translation and a rotation) and to rotate about their own sites. The return probabilities of the pure dumb-bell on the tracer atom are calculated via a double Fourier and Laplace transformation of the transport equations. The mean-square displacement of the tracer atom, which is due to a single defect, is analysed in terms of macrojumps; a macrojump is defined as the whole sequence of elementary jumps which results in the net transport of the tracer atom from one substitutional site to another substitutional site of the f.c.c. lattice; its length depends on the various jump frequencies which are available for the tracer atom when the latter resides on an interstitial location. (11 refs.)

67264 Two-frequency model of self-diffusion in crystals. V.A.Panteleev, V.M.Vorob'ev, V.A.Murav'ev (Physicotech. Res. Inst., N.I. Lobachevski State Univ., Gorki, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1581-3 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2794-8 (Sept. 1982). [received: April 1983]
A new model is put forward for self-diffusion in crystalline solids. It is based on the hypothesis that vacancy jumps to the second coordination sphere are possible. Experiments are derived for the self-diffusion coefficient of the diamond, BCC, and FCC structures. The results are used to account for observed deviations from the Arrhenius law in silicon and normal BCC and FCC metals. Quantitative estimates of the energy barrier for vacancy hops of the new type are given. The results are in good agreement with experiment. (24 refs.)

67265 Vanadium self-diffusion in pure vanadium and in dilute vanadium-iron and vanadium-tantalum alloys. D.Ablitzer, J.P.Haeussler, K.V.Sathyaraj (Ecole Nat. Superieure de la Metall. et de l'Industrie des Mines, Nancy, France).
Philos. Mag. A (GB), vol.47, no.4, p.515-28 (April 1983).
Measurements of vanadium self-diffusion have been made over the temperature range 1050-1874°C. The solute enhancement factor b for vanadium self-diffusion has also been measured in dilute vanadium-iron and vanadium-tantalum alloys. These results, together with the authors' previously published

results on iron impurity diffusion in vanadium, are analysed using the vacancy models of Le Claire (1970) and Jones and Le Claire (1972) to calculate the isotope effect parameters f_i, which are then compared with the measured values of $f_i\Delta K$ of Coleman, Wert and Peart (1968). The authors results confirm the existence of three regimes: (1) free single vacancy migration between 1200 and 1550°C, (2) divacancy contribution at higher temperatures and (3) acceleration of diffusion due to other defects such as dislocations, subgrain boundaries and/or vacancy-interstitial impurity pairs at low temperatures. (14 refs.)

67266 Properties of metal hydrides. II. Y.Fukai.
Solid State Phys. (Japan), vol.17, no.12, p.701-16 (Dec. 1982). In Japanese. [received: April 1983]
For pt.I see ibid., vol.16, p.253 (1981). Experimental results on diffusion processes of hydrogen in metals have been reviewed, and a possibility for their consistent explanation in terms of a quantum-mechanical approach has been proposed. (50 refs.)

66.30H Self-diffusion and ionic conduction in nonmetals

67267 Autodiffusion of ^{45}Ca in calcium vanadates. T.I.Krasnenko, A.S.Zhukovskaya, B.V.Slobodin, A.A.Fotnev (Inst. of Chem., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.845-7 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1005-7 (June 1982). [received: Feb. 1983]
The autodiffusion of ^{45}Ca was studied in polycrystals of $Ca(VO_3)_2$, $Ca_2V_2O_7$ and $Ca_3(VO_4)_2$ at 820-1170K. The concentration dependences of the distribution of ^{45}Ca in all the samples studied are characterised by the presence of two portions where the diffusion coefficients differ by an order of magnitude. The following relationship of the autodiffusion coefficients at temperatures above 920K was established: $D[Ca(VO_3)_2] > D[Ca_2V_2O_7] > D[Ca_3(VO_4)_2]$.

67268 Electrical conductivity and nature of the charge carriers in single crystals of compounds Cs_2HgX_4 (X=Cl, Br, I). V.V.Danilov, V.S.Vorob'ev, A.V.Bogdanova, Z.U.Borisova (A.A. Zhdnov Leningrad State Univ., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.863-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1025-7 (June 1982). [received: Feb. 1983]
With respect to their parameters of electrical conductivity, the ternary compounds Cs_2HgCl_4 and Cs_2HgBr_4 can be considered as wide-band semiconductors. The contribution of the H^+ and OH^--ion components of conductivity increases in the order $Cs_2HgCl_4 \rightarrow Cs_2HgBr_4 \rightarrow Cs_2HgI_4$. (4 refs.)

67269 Ion clustering and proton transport in Nafion membranes and its applications as solid polymer electrolyte. R.S.Yeo (Pinnacle Res. Inst., Cupertino, CA, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.533-8 (March 1983).
The concentrations of fixed ion in Nafion membranes have been calculated based on both the homogeneous model and the ion cluster model while the concentrations of co-ion were calculated from the Donnan expression. The experimental results on the concentrations of co-ion reveal that the ions in this material do form clusters and the membrane also exhibits a strong Donnan exclusion effect. The ionic mobilities obtained from the conductivity and diffusivity studies are in fairly good agreement. Strong acidity coupled with high proton mobility in this membrane provide an important solid polymer electrolyte for a variety of electrochemical applications. The impact of polymer morphology on cell performance is also discussed. (61 refs.)

67270 The AC conductivity of polycrystalline LISICON, $Li_{2+2x}Zn_{1-x}GeO_4$, and a model for intergranular constriction resistances. P.G.Bruce, A.R.West (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
J. Electrochem. Soc. (USA), vol.130, no.3, p.662-9 (March 1983).
The AC conductivity of a polycrystalline, Li^+ ion conducting solid electrolyte, LISICON, $Li_{2+2x}Zn_{1-x}GeO_4$, has been measured over the frequency range 10^{-3}-10^7 Hz and attention focused on the methods of data analysis. The data show intragranular (bulk) and grain boundary effects in which, for a given sample, both effects are characterized by a similar activation energy; a constriction resistance model for the latter is proposed based on air gaps existing in polycrystalline sinters of less than theoretical density. The data only crudely fit a Debye-like equivalent circuit, composed of frequency independent resistors and capacitors, but fit well an equivalent circuit that contains Jonscher elements, i.e. frequency dependence admittances, in addition to normal *R* and *C* elements. Two such Jonscher elements are needed, one for the grain boundary and one for the intragranular contribution. With this circuit, departures from ideality in, for example, the complex impedance, admittance, and electric modulus planes are accounted for. (26 refs.)

67271 The electrical and optical properties of sodium germanate glasses. M.N.Khan, E.E.Khawaja (Dept. of Phys., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
J. Phys. Colloq. (France), vol.43, no.C-9, p.319-22 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The electrical conductivities of a series of specimens in the system Na_2O-GeO_2 were measured at temperatures ranging from room temperature to 350°C. These results are interpreted in terms of electrical gaps, which decrease linearly with the Na_2O content of the glasses. Their absorption edges are measured and analysed in terms of forbidden non-direct transitions across an optical energy gap which is also found to increase linearly with the Na_2O content of the glasses. However, the optical gap was found roughly to be twice the corresponding electrical gap. (6 refs.)

67272 Transport processes in glass. A.R.Cooper,Jr. (Dept. of Metall. & Materials Sci., Case Western Reserve Univ., Cleveland, OH, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.369-80 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The rate of glass melting depends on the combined influence of the transport of several quantities: heat, momentum, species, and electric charge. The phenomenology of each of these processes obey a similar set of laws and there are a variety of carriers and several modes of transport for each. The transport efficients are likewise related and depend on the self-diffusion coefficients of species, phonons and photons. Thermal conductivity and viscosity of glass forming liquids are discussed from this point of view. (41 refs.)

67273 Computer simulation studies of migration mechanisms in ionic glasses and liquids. C.A.Angell, P.A.Chesseman, S.Tamaddon (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.381-5 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Ion dynamics computer simulations of the migration of cation and anions in 'computer glasses' and liquids of silicate and fluoride types are reported, and examples of diagnostic power of the simulation method are given. The existence of high pressure minima in the viscosity of molten aluminosilicates in indicated. (6 refs.)

67274 Simple models for the ionic conduction mechanism in glasses. J.O.Isard, M.Jagla, K.Mallick (Dept. of Ceramics, Glasses & Polymers, Univ. of Sheffield, Sheffield, England).
J. Phys. Colloq. (France), vol.43, no.C-9, p.387-90 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Many glasses show relatively high lithium ion conductivities which result from low activation energies. The activation energy is attributed to (i) the elastic distortion of 'doorway' and (ii) the separation of cationic from anionic charges. Simple calculations for a rigid network show that the contribution of (i) to the activation energy is least for Li^+ compared with the other alkali metal ions, while the contribution of (ii) is the greatest for this ion. The calculated value for Li^+ is larger than the observed activation energy. It is suggested that the Li-conducting glasses are ionic with anionic groups having freedom to rotate and 'hand-on' Li^+ ions from one group to another, and the Li^+ ions can 'roll around' the anions. The effect of dielectric relaxation may also lower the activation energy. (15 refs.)

67275 Pre-exponential term in the Arrhenius equations for electric conductivity of glass. C.T.Moynihan, D.L.Gavin, R.Syed (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.395-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Very precise electrical conductivity data on a series of six glasses of molar composition $25(xNa_2O.(1-x)K_2O)$-$5Al_2O_3$-$70SiO_2$ with $0.95 \leq x \leq 1$ have been obtained over a large temperature range (~310°C). Analysis of this data suggests that the pre-exponential term in the Arrhenius conductivity equation is temperature independent. (14 refs.)

67276 Electrical impedence and concentration fluctuations in silica-based glasses. D.Ravaine (Lab. d'Energetique Electrochimique, ENSEEG, Saint-Martin d'Heres, France), A.F.Wright.
J. Phys. Colloq. (France), vol.43, no.C-9, p.399-402 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A model is proposed for the interpretation of the circular arcs observed for the electrical impedances of ion-conducting glasses when plotted in the complex plane. By fitting with experimental results, this model leads to the determination of concentration fluctuations in glasses and finds good support from comparison with SANS data and thermodynamic calculations. The extension of crystalline ionic conductors is suggested. (11 refs.)

67277 Ionic conducting glasses of the Li_2S-GeS_2-LiI system. Their use in 'all-solid' generators with lithium anodes. M.Ribes, B.Carette, M.Maurin (Lab. de Chimie Minerale, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.403-6 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
In the Li_2S-GeS_2-LiI system, glasses have been synthesized with an electrical conductivity higher than $10^{-4}\Omega^{-1}$ cm^{-1} (at 25°C), a transference number ti=1, a stability redox range higher than 3 volts and stable against lithium metal (at least at room temperature). These characteristics have made it possible to use them as electrolytes in all-solid button cells of lithium anode/glass/composite cathode, the first results of which (polarization, discharge curves...) are presented. (14 refs.)

67278 Alkali fluoride containing ZrF_4-based glasses: electrical properties and NMR investigation. D.Ravaine, W.G.Perera, M.Minier (Lab. d'Energetique Electrochimique, ENSEEG, Saint Martin d'Heres, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.407-10 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
New results obtained on alkali fluoride containing ZrF_4-based glasses from electrical and NMR measurements are used for the interpretation of the anionic conduction mechanism in fluoride glasses. Local F^- motions arise in the vicinity of modifier cations while long range displacements are related to the network former polyhedron arrangement. (9 refs.)

67279 Electrical properties of rapidly quenched lithium-silicate glasses. M.Yoshiyagawa, M.Tomozawa (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.411-14 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Li_2O-SiO_2 glasses with high Li_2O content (33-62 mole% Li_2O) were presented by a twin roller quench apparatus, and their electrical characteristics were measured as function of temperature. Glass specimens with conductivity as high as $10^{-5}\Omega^{-1}cm^{-1}$ at room temperature were obtained. As far as DC conductivity was concerned, rapid quenching was equivalent to increasing the alkali content. On the other hand, the quenching rate had little influence on high frequency (or low temperature) electrical characteristics. This suggests that the quenching rate affects mainly the long range motion of alkali ions. (10 refs.)

67280 Ionic conductivity of Li_2O-$(LiCl)_2$-B_2O_3-Al_2O_3 glasses. Huang Xihuai, Huang Pengnian (Shanghai Inst. of Ceramics, Chinese Acad. of Sci., Shanghai, China).
J. Phys. Colloq. (France), vol.43, no.C-9, p.415-18 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The ionic conductivity, dynamical compressibility, IR and Raman spectra, as well as Li^+-H^+ ion exchange properties were investigated for Li_2O-$(LiCl)_2$-B_2O_3-Al_2O_3 glasses. The electrical properties were interpreted from the point of view of the glass structure. (6 refs.)

67281 Dynamics of ions of the two-dimensional superionic conductor $AgCrS_2$. P.Bruesch, T.Hibma (Brown-Boveri Res. Center, Baden, Switzerland), W.Buhrer.
Phys. Rev. B (USA), vol.27, no.8, p.5052-61 (15 April 1983).
$AgCrS_2$ is a quasi-two-dimensional superionic conductor for silver ions which shows a second-order phase transition at T_c=673K. Well below T_c, $AgCrS_2$ is ordered and pyroelectric; above T_c the silver ions are disordered and the

phase is nonpyroelectric. The ion dynamics below T_c has been studied by means of far-infrared and inelastic neutron scattering experiments. The most interesting feature of the phonon structure is the existence of very-low-frequency acoustic and flat optic modes. The low-frequency TO mode at $q=0$ shows a strong and anomalous temperature dependence down to 10K. The authors show that this temperature dependence can be explained by a highly anharmonic motion of a particle in an effective potential. The patterns of ionic displacements of the low-frequency modes have been obtained from a calculation based on a rigid-ion model. This calculation shows that in the low-frequency modes the silver ions are strongly involved and vibrate parallel to the layers. These modes therefore contributed strongly to the mean-square displacements of the silver ions and to the reaction coordinates for ionic jumps. The jumps of silver ions reduce the spontaneous polarization of the pyroelectric phase and finally lead to the order-disorder pyroelectric phase transition at T_c. (19 refs.)

67282 Behavior of the activation energy for ionic conduction in $RbAg_4I_5$ near 209K. R.A.Vargas, A.T.Bravo (Dept. de Fisica, Univ. del Valle, Cali, Colombia).
Rev. Mex. Fis. (Mexico), vol.29, no.2, p.197-201 (Feb. 1983).
The authors have examined the 209K phase transition of $RbAg_4I_5$ by measuring the differentials of the sample resistance as a function of temperature on single crystals. Their results reveal a continuous variation of the activation energy with temperature through the transition which is attributed to the dominant effect of short range order on the ionic conductivity. (11 refs.)

67283 Rapid anion transfer in Bi_2WO_6 crystals. V.K.Yanovskii, V.I.Voronkova, Yu.E.Roginskaya, Yu.N.Venevtsev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1603-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2829-31 (Sept. 1982). [received: April 1983]
The authors show that the ionic conductivity in Bi_2WO_6 single crystals is anomalously high, and a possible correlation between the rapid transfer of oxygen anions and the polar nature of the crystals is discussed. Measurements of electrical conductivity in the range 20-1000°C were carried out in air according to the two-electrode method with alternating current. The authors also investigated the dependence of conductivity on frequency in the range 10^2-2.5×10^8 Hz. (7 refs.)

67284 Conductivity of the Li_4GeO_4-Li_3PO_4 solid-phase binary system. V.A.Bakaev, L.S.Leonova (Inst. of New Chem. Problems, Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.6, p.659-62 (June 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.6, p.743-6 (June 1982). [received: Feb. 1983]
The conductivity of the Li_4GeO_4-Li_3PO_4 solid binary system in the range of compositions from 10 to 50 mole% phosphate has been measured. The maximum conductivity is achieved when the Li_3PO_4 content is 20 mole%. The addition of $LiTaO_3$ and Li_2O improves the sintering quality and increases the conductivity of the solid solutions. From a comparison of the current-voltage characteristics with reversible and blocked electrodes it follows that the conductivity of the system studied has a predominantly ionic character. (5 refs.)

67285 Verification of the model for phosphorus diffusion from oxide sources into silicon. A.Checielewska (Inst. of Electron Technol., Sci. & Production Centre of Semiconductors, Warszawa, Poland).
Electron Technol. (Poland), vol.13, no.1-2, p.3-17 (1980).
The model of dopant diffusion from oxide sources into silicon has been confirmed by experiments using phosphorus diffusion at 1050°C as an example. In the range of concentration in silicon 10^{18}-2×10^{20} cm^{-3} the computed phosphorus profiles are in good agreement with the measured concentration distributions. Also, the basic relations between parameters of a diffusion process are described in detail by the model. The segregation constant and concentration dependences of diffusion coefficients in silicon and oxide, taken into consideration in the model, have been determined from experiments. (39 refs.)

67286 As migration during PtSi formation. A.H.Hamdi, F.D.McDaniel (Dept. of Phys., North Texas State Univ., Denton, TX, USA), S.R.Wilson.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1738-40 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The migration of implanted As during PtSi formation on (100) Si wafers has been studied by Rutherford backscattering techniques. Two thicknesses of PtSi layer (50 and 200 nm) have been chosen for this study. The PtSi formation temperatures were either 525°C or 625°C. The data show that the number of the migrating As atoms is independent of the PtSi thickness or formation temperatures used in this investigation. (19 refs.)

67287 Boron diffusion during electron pulse annealing of silicon. J.M.Dilhac, C.Ganibal, G.Vialaret, A.Martinez (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France).
J. Appl. Phys. (USA), vol.54, no.4, p.2111-13 (April 1983).
Results concerning boron diffusion during electron pulsed annealing of silicon are presented. The initial boron profile is realized by successive implantations at 50, 80, and 190 keV. Dopants diffusion is explained theoretically in terms of liquid phase diffusion. Electrical acitivity is about 100%. (12 refs.)

67288 Alkali migration in glasses on electron, proton and heavier ion irradiation. G.Battaglin, G.Della Mea, G.de Marchi, P.Mazzoldi (Istituto di Fisica, Univ. di Padova, Padova, Italy), A.Miotello, M.Guglielmi.
J. Phys. Colloq. (France), vol.43, no.C-9, p.645-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The authors present a systematic study of the Na profile modifications in soda-lime silica glasses after electron, proton and heavier ion irradiations. The results are discussed in terms of field assisted diffusion and Na preferential sputtering. (14 refs.)

67289 Photostimulated diffusion of light substitutional impurities in semiconductors and insulators. V.N.Pavlovich (Inst. for Nuclear Res., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K9-14 (1 March 1983).
The influence of resonant infrared light on the diffusion of light substitutional impurities in semiconductors and insulators is discussed. The influence of the redistribution of impurity atoms on the diffusion coefficient of the substitutional impurities depends on the mechanism of diffusion of the given impurity. When the vacancy mechanism of diffusion takes place the impurity hopping rate into nearest vacant site is increased. When the dissociative mechanism is realized the dissociation constant, i.e. the possibility of an impurity transition from a site to an interstice is increased. (10 refs.)

67290 Mechanism of impurity diffusion in a-Si:H and diffusion blocking by fluorine inclusion. H.Matsumura, K.Sakai, M.Maeda, S.Furukawa (Dept. of Appl. Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.938-40 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Diffusion of impurities such as boron or antimony in both the glow-discharged a-Si:H and a-Si:F, H is studied by the nuclear reaction technique and the Rutherford backscattering technique. The diffusion constant and its activation energy are evaluated and are compared with those of hydrogen in a-Si:H. The diffusion constant of the impurity in a-Si:H depends only weakly on the impurity itself but is equal to the diffusion constant of hydrogen. That is, impurity diffusion is controlled by the movement of hydrogen. Impurity diffusion is apparently blocked in the film containing fluorine, a-Si:F, H. (10 refs.)

67291 Simple estimation of impurity diffusion coefficients in pure metals. D.L.Beke, F.J.Kedves (Inst. for Appl. Phys., L. Kossuth Univ., Debrecen, Hungary).
Z. Metallkd. (Germany), vol.74, no.4, p.238-40 (April 1983).
On the basis of the law of corresponding states for metals the simple and useful relation ln $D_i/D=A_1(T_R).\alpha/T_m$ was derived, where D_i and D are the impurity and self-diffusion coefficients, T_m is the melting point of the pure matrix metal, α is the initial slope of the median line of the solidus and liquidus, and $A_1(T_R)$ is common function of the reduced temperature, in which $T_R=T/T_m$ for metals having identical structures. The relation is valid whether the diffusion coefficients measured satisfy an Arrhenius-type relation or not. As an example, this relation was examined for impurity diffusion in Nb, Ta, Mo, W and in Cu, Ag, Ni and Al, and it was concluded that it described the experimental data well. (28 refs.)

66.30L Diffusion, migration, and displacement of other defects

67292 Diffusion induced grain boundary migration and recrystallization in the Cu-Ni system. F.J.A.den Broeder (Philips Res. Labs., Eindhoven, Netherlands), S.Nakahara.
Scr. Metall. (USA), vol.17, no.3, p.399-404 (March 1983).
Presents the most important conclusions of a diffusion induced grain boundary migration (DIGM) study in the Cu-Ni system, which enable the authors to settle the controversy between the kinetic and thermodynamic treatments, and to reformulate the driving force for DIGM. They also report a new important phenomenon related to GB diffusion, which is called diffusion induced recrystallization (DIR). It is argued that DIR, like DIGM, is basically caused by the unequal GB diffusion flows of the two species. The Cu-Ni system was chosen because it is well established that Cu is the faster volume-diffusing species at all compositions, a situation which probably also holds for GB diffusion. It is therefore interesting to study DIGM both for the diffusion of Ni into Cu GBs and vice versa, as a function of temperature. (18 refs.)

67293 Physical properties of Ni contacts to CdTe. A.M.Mancini (Istituto do Fisica, Univ. e Sezione INFN, Bari, Italy), E.Perillo, A.Quirini, E.Rosato, G.Spadaccini, L.Vasanelli.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1741-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The processes occurring during the heat treatment of Ni coated CdTe crystals have been investigated by means of Rutherford Backscattering Spectroscopy, X-ray diffraction measurements and Auger Electron Spectroscopy. The heat treatment, at temperatures higher than 350°C, gives rise mainly to a solid-solid reaction between Ni and Te to form a mixture of NiTe and $NiTe_2$.

Small quantities of Ni tellurates have been also detected on the sample surfaces. (8 refs.)

67294 Lateral growth of titanium silicide over a silicon dioxide layer. P.Revesz, J.Gyimesi, L.Pogany, G.Peto (Central Res. Inst. for Phys., Budapest, Hungary).
J. Appl. Phys. (USA), vol.54, no.4, p.2114-15 (April 1983).
If a silicon dioxide step on a single crystal of silicon covered with titanium is annealed, then, following vertical growth on the silicon part, lateral growth of titanium silicide takes place over the oxide layer. In the temperature range 750-950°C this lateral growth of Ti-silicide was found to be a linear function of the square root of the annealing time. The activation energy of the lateral growth was found to be 1.89 eV. During lateral growth the Ti-silicide forms a deep spike in the silicon crystal at the SiO_2 step. (5 refs.)

67295 Electric field enhanced diffusion in trans-(CH). J.H.Kaufman, E.J.Mele, A.J.Heeger, R.Kaner, A.G.MacDiarmid (Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.571-4 (March 1983).
A theory is developed which shows how high power and high current densities can be generated by a $(CH)_x$ battery cell despite the slow diffusion and low conductivity characteristic of ionic motion in polyacetylene. The presence of a small driving potential (or a load) causes current to flow and generates a large electric field within the fibrils. This field dramatically increases the ion transport rate when the electronic screening length is comparable to or greater than the radius of a fibril. (17 refs.)

67296 Lattice thermal resistivity of III-V compound alloys. S.Adachi (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
J. Appl. Phys. (USA), vol.54, no.4, p.1844-8 (April 1983).
Lattice thermal resistivities of III-V compound alloys have been analyzed with a theoretical prediction based on a simplified model of the alloy-disorder scattering. The theoretical prediction shows a quite good agreement with the experimental data on various III-V ternary compounds. This model has also been applied to obtain the thermal resistivity of $In_{1-x}Ga_xAs_yP_{1-y}$ lattice matched to InP for the composition of $0 \leq y \leq 1.0$. The result indicates that the thermal resistivity increases markedly with alloying and exhibits a maximum value of about 24 W^{-1} deg cm at an alloying composition of $y \approx 0.75$. (13 refs.)

67297 On the use of penetration depth in thermal transient finite element analysis. G.Szabolcs (Inst. for Electrical Power Res., (VEIKI),,Hungary). Budapest.
Nucl. Eng. & Des. (Netherlands), vol.74, no.1, p.139-40 (Jan. 1983).
The author estimates the element sizes in heat conduction analysis using finite elements. The author considers the problem of one-dimensional heat conduction in a semi-infinite solid. The surface was subjected to convective boundary condition. (3 refs.)

67.00 QUANTUM FLUIDS AND SOLIDS; LIQUID AND SOLID HELIUM

(see also 05.30 Quantum statistical mechanics)

67.20 QUANTUM EFFECTS ON THE STRUCTURE AND DYNAMICS OF NONDEGENERATE FLUIDS

67298 Unsteady He^4 convection and related quantum constraints. T.H.K.Frederking (Walther-Meissner Inst., Garching, Germany).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.711-19 (1982).
In the course of transient stability studies of He II-cooled NbTi/Cu localized Benard convection may be observed in a He I layer above the lambda temperature. In this context quantization conditions are studied for the Newtonian fluid He I involving Onsager-Feynman vortices with quantized circulation. Stability data obtained support evolution of He I layer convection from cellular order toward turbulent disorder ('catastrophe'). Onset data support a vortex number of unity per cell consistent with minimum expenditure rates. (13 refs.)

67.50 FERMI FLUIDS; LIQUID HELIUM-3

67299 Rotating nulear demagnetization refrigerator for experiments on superfluid He^3. P.J.Hakonen, O.T.Ikkala, S.T.Islander, T.K.Markkula, P.M.Roubeau, K.M.Saloheimo (Low Temperature Lab., Helsinki Univ., Helsinki, Finland), D.I.Garibashvili, J.S.Tsakadze.
Cryogenics (GB), vol.23, no.5, p.243-50 (May 1983).
A nuclear demagnetization cryostat, capable of producing submillikelvin temperatures during rotational motion, was constructed. The apparatus has been used for NMR experiments on superfluid He^3 at angular velocities up to 1.5 rad s^{-1}. The essential technical details and the operation of the cryostat are described. (38 refs.)

67300 Microscopic determination of the self energy of ^{3}He. E.Krotscheck (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), R.A.Smith.
Phys. Rev. B (USA), vol.27, no.7, p.4222-35 (1 April 1983).
From Planck's constant, the mass of a ^{3}He atom, and the 'Hartree-Fock dispersion 2' potential (which describes ^{4}He quite well) the authors calculate the ground-state energy and the complex self-energy of liquid ^{3}He. The calculations are performed within the framework of correlated-basis-function theory. The starting point in this method is an optimised Fermi hypernetted-chain calculation. Improvements on the wave function are incorporated through nonorthogonal perturbation theory. For the energy, they include corrections of second and third order in the effective two-body interaction as well as second-order terms in the effective three-body interaction. Second- and third-order perturbative corrections to the self-energy of a ^{3}He atom reveal a rapid variation with both energy and momentum in the vicinity of the Fermi surface. This effect is shown to be due to the attractiveness of the effective interaction in the spin channel. The results are in quantitative agreement with phenomenological determinations of the self-energy based on the experimental specific heat. (25 refs.)

67301 Nonanalytic supercurrents in ^{3}He-*A*. P.Muzikar (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), D.Rainer.
Phys. Rev. B (USA), vol.27, no.7, p.4243-50 (1 April 1983).
The energy gap of the *A* phase of superfluid ^{3}He has two singular points on the Fermi surface. These singular points lead to various theoretical puzzles, including one recently discovered by Volovik and Mineev (1981). These authors, using a generalised—gauge-transformation approximation, find a term in the $T=0$ supercurrent which is nonanalytic in gradients of the order parameter. The present authors use the quasiclassical equations invented by Eilenberger (1968) to check the validity of their approximation; They find that the generalised—gauge-transformation approximation fails, in that terms it leaves out make important (in fact, divergent) contributions to the nonanalytic supercurrent. They then formulate a new way to calculate the leading nonanalytic terms in the supercurrent. (10 refs.)

67302 Pulsed nuclear magnetic resonance and soliton lattice in ^{3}He-*A*. M.Nakahara, K.Maki (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4456-8 (1 April 1983).
When the magnetisation of ^{3}He-*A* is tipped by a finite angle, the magnetisation precesses with definite angular velocity reflecting the underlying texture. The authors analyse theoretically the precession frequency in the presence of composite solitons in ^{3}He-*A* and compare the results with recent experiments of Giannetta et al (1981) and of Gould et al (1980). (9 refs.)

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

67303 Sound absorption in weak He^3-He^4 solutions at high densities and low temperatures. V.N.Grigoriev, N.E.Dyumin, L.S.Dikina, S.V.Svatko.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.341-9 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The coefficient of the first sound absorption is measured in He^3-He^4 solutions of molar concentrations 0.5 and 0.05% He^3 at constant densities 0.153, 0.159, 0.165 0.170 *g/cm3*. The measurements were made at temperatures below 0.9K and at frequency 29.8 *MHz*. The analysis of experimental results shows that at all the densities investigated the sound absorption in the solution containing 0.5% He^3 is determined by the He^3 viscosity and the scattering by thermal phonons, whose mean free path is limited by He^3 impurities. The sound absorption in the 0.05% He^3 solution is qualitatively the same as in pure He^4 which means that at moderately high densities, the initial part of the phonon spectrum with low He^3 fractions still reveals decay. The time of transverse phonon relaxation in He^4 at 1.1 *atm* is found along with the time of phonon relaxation during the phonon interaction with He^3 impurities. (28 refs.)

67.70 FILMS

(inc. physical adsorption)

67304 Singlet superfluidity in ^{3}He film on ^{4}He film. S.Kurihara (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1311-16 (April 1983).
It is predicted that spin-singlet superfluidity can be realized in a submonolayer ^{3}He film on the surface of thin film of superfluid ^{4}He. The basic mechanism of the superfluidity is the attraction between ^{3}He quasi particles arising from exchange of virtual third sound quanta. It is argued that the superfluid transition of ^{3}He film is of Kosterlitz-Thouless nature if the ^{4}He film is thick, and changes its nature as the ^{4}He thickness is reduced, with a crossover thickness of ~2 atomic layers. Several experiments are suggested to detect the new phase transition, to test whether the proposed mechanism is really working, and to examine the nature of the transition. The transition temperature is estimated to be in a temperature range attainable with a dilution refrigerator.

67305 Direct and thermal desorption of ^{4}He films. M.Sinvani, P.Taborek, D.Goodstein (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.59-62 (11 April 1983).
The authors have studied desorption from a ^{4}He film due to a hot but low-intensity beam of phonons incident from a sapphire substrate. Time of flight spectra of the desorbed atoms revealed two distinct peaks which they attribute to direct desorption by substrate phonons and to thermalization with subsequent desorption. (12 refs.)

67306 On the disappearance of superfluidity in helium films. G.Bannink. State Univ. Leiden, Netherlands thesis, 9 March 1983. Leiden, Netherlands: State Univ. Leiden (1983), 122 pp.
It has now been known for a long time that thin helium films retain superfluid transport properties down to thicknesses of only a few atomic layers. The mere occurrence of superfluidity in these almost two-dimensional systems presents a very fundamental problem, since the phenomenon of long-range order, believed to be responsible for the occurrence of superfluidity in bulk helium, cannot exist in two dimensions. The changes in superfluid properties on the film thickness are investigated. A thin-film oscillator, formed by two large film reservoirs connected by a long and narrow tube, is used to study both the mass transport properties and the third-sound phenomena. Both sets of data are analysed in the framework of a two-fluid model.

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

67307 Quantum diffusion and recombination of atoms in a crystal at low temperatures. Yu.Kagan, L.A.Maksimov, N.V.Prokof'ev (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
JETP Lett. (USA), vol.36, no.6, p.253-6 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.204-7 (20 Sept. 1982). [received: April 1983]
The recombination kinetics of atoms in a crystal, when quantum sub-barrier diffusion is the limiting factor, is examined. The experimental results on recombination of atomic hydrogen in a molecular hydrogen matrix are analyzed. (4 refs.)

68.10 FLUID SURFACES AND INTERFACES WITH FLUIDS

(inc. surface tension, capillarity, wetting and related phenomena)

67308 The contribution of hydrogen bonds to the surface tension of water. A.Luzar (Medical Faculty, Inst. of Biophys., Ljubljana, Yugoslavia), S.Svetina, B.Zeks.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.485-90 (15 April 1983).
The surface energy, the surface free energy and the surface entropy of liquid water are calculated from the decrease in the number of hydrogen bonds in the surface layer, estimated on the basis of a simplified water structure scheme. In the calculations of the free energy density function only the hydrogen-bond interactions between molecules are taken into consideration. The resulting surface free energy of water is ≈43 mN/m at 25°C. The calculated temperature dependence is consistent with that observed. (18 refs.)

67309 The phases of insoluble monolayers: comparison between the surface pressure-molecular area (Π-A) diagram and shear modulus measurements. K.Miyano, B.M.Abraham (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA), J.B.Ketterson, S.Q.Xu.
J. Chem. Phys. (USA), vol.78, no.7, p.4776-7 (1 April 1983).
The authors have made a number of unusual observations which call into question the conventional interpretation of the surface pressure vs molecular area, the Π-A diagram. The data obtained on a series of long chain aliphatic alcohols $C_{18}OH$, $C_{20}OH$, $C_{21}OH$, and $C_{22}OH$, are currently being analyzed, but the observations are, they believe, of such a nature that the qualitative results merit reporting. The unique signature of a solid phase is the existence of a static shear modulus. They have designed an instrument that can measure a very small modulus in the presence of a high viscosity. (5 refs.)

67310 A study of the liquid-vapor interface of mercury: computer simulation results. M.P.D'Evelyn, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5081-95 (15 April 1983).
The paper extends their recently proposed pseudoatom theory for the liquid-vapor interface of simple metals to mercury. An important difference between mercury and the alkali metals is that in the former the metal-nonmetal transitions takes place over a range of density positioned at much higher density than the critical density. A modified pseudoatom model, with an improved treatment of the metal-nonmetal transition, is presented. Using the modified effective Hamiltonian for the ions, Monte Carlo simulations of the liquid mercury surface have been carried out. The simulations reveal a highly structured liquid-vapor transition zone, with large amplitude density oscillations. The metal-nonmetal transition is found to play a critical role in determining the liquid-vapor interface structure, and it gives rise to a partial monolayer of nonmetallic atoms adsorbed on the metal surface. A detailed comparison of their results with the existing experimental and theoretical work, particularly the X-ray reflectance data of Lu and Rice (1978), is presented. (86 refs.)

67311 Theory of electrolyte solution interfaces at finite dilution. M.A.Wilson, A.L.Nichols,III, L.R.Pratt (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5129-37 (15 April 1983).
The theory of dilute electrolyte solution interfaces is extended to treat higher concentration solutions. It is shown that the dominant initial higher concentration correction to the Onsager-Samaras results (1934) derive from solving the random phase approximation (RPA) for the salt concentration profiles in a satisfactorily self-consistent manner. Further, for conventional primitive solution surface models appropriate to dilute electrolyte solutions interfaces, it is shown that short-ranged non-Coulombic interionic interactions make a negligible contribution to the salt concentration profiles for bulk concentrations as high as a few tenths molar. Under these conditions the initial correction to the Onsager-Samaras absorption has a negative definite sign, so that the Onsager-Samaras surface tension will be less than the true surface tension for the primitive surface model treated. The theoretical results are compared with available computer simulation data. For the concentration range indicated, the agreement between these results is excellent. Finally, the authors provide a new analytical treatment of the RPA which is suitable for use at higher concentrations, and reduces to the Onsager-Samaras type results in the limit of infinite dilution. This improved treatment is obtained by analytically evaluating all integrals in the resulting RPA functional for a flexible category of troughlike trial concentration profiles. The choice of trial concentration profile is then determined by an optimization condition that the leading correction to the predicted interfacial absorption must vanish. (11 refs.)

67312 Contact angles between III-V melts and several substrates. U.Konig, W.Keck (Forschungsinst. Ulm, AEG-Telefunken, Ulm, Germany).
J. Electrochem. Soc. (USA), vol.130, no.3, p.685-6 (March 1983).
The wetting behavior of several melts with different III-V compound semiconductors is studied. The characteristic parameter measured is the contact angle of a melt drop with a solid. It is evaluated by a geometrical measurement of the melt drop. The importance of clean surfaces of drop and solid is shown. Contact angles between 20° and 60°C are found, depending on the type and composition of the melt and substrate. The temperature dependence amounts to about −4° per 100K in increase. In addition, the contact angle varies with the substrate orientation. The (100) oriented substrates are wetted better than (111)A oriented ones. (14 refs.)

67313 Measurement of the surface tension of gallium and indium in a hydrogen atmosphere by the sessile drop method. U.Konig, W.Keck (AEG-Telefunken, Forschungsinst. Ulm, Ulm, Germany).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.299-303 (April 1983).
Reports an evaluation of the surface tension σ of liquid gallium and indium in a palladium-diffused hydrogen atmosphere at temperatures up to 1150K. Small and large sessile drops of gallium have $\sigma(T_{MP})=680$ mJ m^{-2} at the melting point and a temperature dependence $d\sigma/dT=-0.091$ mJ m^{-2} K^{-1}. Large sessile drops of indium have $\sigma(T_{MP})=560$ mJ m^{-2} at the melting point and a temperature dependence $d\sigma/dT=-0.10$ mJ m^{-2} K^{-1}. (16 refs.)

67314 Continuous and first-order wetting transition from the van der Waals theory of fluids. E.H.Hauge (Inst. for Teoretisk Fysikk, Univ. i Trondheim, Trondheim, Norway), M.Schick.
Phys. Rev. B (USA), vol.27, no.7, p.4288-301 (1 April 1983).
The transition between incomplete wetting of an attractive substrate in contact with a gas at gas-liquid coexistence is studied. Within the framework of the systematic van der Waals (mean-field) theory of fluids, it is shown that both a continuous wetting transition, as found by Sullivan (1979, 1981), and a first order transition with a prewetting line, previously found by other methods, are possible. The relative magnitude of the various characteristic lengths in the problem is shown to be of relevance in this context. Beyond the model calculations, purely thermodynamic arguments show that in general the prewetting line, if it exists, joins the bulk coexistence line tangentially in the T-μ phase plane. The manner in which the difference in slope vanishes as bulk coexistence is approached is closely related to the nature of the forces. (25 refs.)

67315 Quantitative evaluation of the interfacial free energies at a solid-liquid lamellar eutectic interface. W.F.Kaukler (NASA, Marshall Space Flight Center, AL, USA), J.W.Rutter.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.305-13
The solid-liquid interfacial free energies of each of the individual phases comprising the eutectic system, carbon tetrabromide-hexachloroethane, were measured as a function of composition using a 'grain boundary groove' technique. Thermodynamic data were combined with groove shape measurements made from high resolution optical photomicrographs of the solid-liquid interfaces to give the interfacial free energy data. An interfacial free energy balance at the eutectic trijunction was performed to obtain all the forces acting on that point. The three interphase interfacial free energies at the eutectic trijunctions as well as a solid-solid phase boundary torque were evaluated. It was found that the solid-liquid interfacial free energies of the two phases of the eutectic could be evaluated from photomicrographs of growing or stationary eutectic interfaces. In addition, it was found that for a substantial range of freezing conditions the eutectic interface shape can be predicted from a knowledge of the interfacial free energies alone. (13 refs.)

68.15 LIQUID THIN FILMS

67316 Recent advances in the LB film studies. M.Sugi, M.Saito, T.Fukui, S.Izima.
Solid State Phys. (Japan), vol.17, no.12, p.744-52 (Dec. 1982). In Japanese. [received: April 1983]
A summary is given of the recent advances in Langmuir film studies. The historical background and the basic concepts are also outlined. (45 refs.)

68.20 SOLID SURFACE STRUCTURE

67317 A theoretical inquiry into the question of W and Ta (100) atomic structures. G.Treglia (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), M.-C.Desjonqueres, D.Spanjaard.
J. Phys. C (GB), vol.16, no.12, p.2407-19 (30 April 1983).
In spite of the very large number of experiments (LEED, AES, UPS, MeV He^+ scattering, work function, FIM) carried out on W (100), no structural model consistent with all the data has been proposed yet: in particular, the question of the reconstruction thermally induced when the sample is cooled below room temperature remains a puzzling problem. Furthermore, from a theoretical point of view, no definitive answer has been given. Actually, either

the mechanism invoked for the reconstruction is too weak, or some contributions are omitted or calculated without sufficient care. The authors compute here the surface energy of W (100) taking into account the band term treated in the tight binding approximation, a pairwise repulsive potential of the Born-Mayer type and the electronic correlation contribution obtained from a perturbation treatment of the Hubbard model in the band limit. This energy is then fully minimised with respect to all coordinates of surface atoms, keeping all atoms neutral for any displacement. They find that the unreconstructed surface is the most stable at $T=0$K and discuss this unexpected result. A similar calculation for Ta (100) leads to opposite conclusions. (43 refs.)

67318 Glass surfaces—1982. L.L.Hench (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.625-36 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A new category of glass surface is described. Type IIIB surfaces are composed of multiple layers of oxides, hydroxides, and hydrated silicates resulting from a sequence of solution-precipitation reactions between the glass surface and leaching solutions. Very low leach rates and then ion depletion depths of certain compositions of complex nuclear waste glasses are due to Type IIIB surfaces. The solubility limits that establish the equilibrium ionic concentrations for burial ground waters also establish the multiple barrier Type IIIB films, to protect nuclear waste glasses in contact with those ground waters. (43 refs.)

67319 Altered glasses: surface analysis study. J.H.Thomassin, P.Baillif, J.C.Touray (Dept. des Sci. de la Terre, Univ. d'Orleans, Orleans, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.637-40 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The study of the superficial composition of altered glasses has been investigated by XPS (or ESCA), secondary ion mass spectrometry (SIMS) and electron microscopes (TEM and SEM). The selected materials were industrial and natural glasses; the solutions were fresh water, sea-water and metal-bearing diluted solutions. The temperature was 90°C, the bulk was neither stirred nor replenished. All runs were performed on hand-fractured sections of glasses. Amongst the results obtained, one may quote the formation of a superficial Al-rich layer with an increase of Al into the hydrated underlying glass. Another result shows: (1) during the alteration in fresh water, the behaviour of iron and its influence on the alteration process can be related to the initial iron concentration; (2) in sea-water hydroxycarbonates were detected; these phases are the precursors of phyllosilicates characteristic of marine alteration of glasses. (9 refs.)

67320 Application of nuclear analysis methods to nondestructive measurements of concentration profiles of the surface region of glasses by aqueous leaching. P.Trocellier, C.Engelmann (DCAEA-SEA-SEAIN, CENS, Gif-sur-Yvette, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.641-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Nuclear analytical techniques based on direct observation of resonant reaction and charged particle backscattering are briefly described. Few depth profile examples concerning leached glasses are shown. (8 refs.)

67321 Direct analysis of the structure, concentration, and chemical activity of surface atomic vacancies by specialized low-energy ion-scattering spectroscopy: TiC(001). M.Aono, Y.Hou, R.Souda, C.Oshima, S.Otani, Y.Ishizawa (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1293-6 (25 April 1983).
The structure, concentration, and chemical activity of atomic vacancies at the TiC(001) surface have been directly analyzed by specialized low-energy ion-scattering spectroscopy. It has been found that carbon vacancies are formed at the surface under a certain condition, and they capture oxygen atoms into the vacancy holes exhibiting a very high activity. (13 refs.)

67322 Ion beam crystallography of the Si(111)-(7×7) and (1×1) surfaces. R.M.Tromp, E.J.van Loenen, M.Iwami, F.W.Saris (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.779-80 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
New results have been obtained with Medium Energy Ion Beam crystallography on the structures of the Si(111)-(7×7) and on the laser irradiated Si(111)-(1×1) surfaces. The structures of both surfaces appear to be very similar. (3 refs.)

67323 Segregation of As on GaAs(110) surfaces observed immediately after cleavage. F.Bartels, H.J.Clemens, W.Monch (Lab. fur Festkorperphys., Univ. Duisburg, Duisburg, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.801-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A local excess of pure As was observed on surfaces cleaved from Te-, Si-, and Zn- doped boat-grown GaAs and from a sample fabricated by the travelling heater method. The surface segregation was studied by locally resolved Auger-electron and low-energy electron energy-loss spectroscopy. The diameter of the arsenic spots which varies up to 70 μm immediately after cleavage and the number of spots increase during storage at room temperature and by anneals at up to 170°C. With the larger spots a fine-structure is distinguishable. (8 refs.)

67324 New method for the analysis of reflection high-energy electron diffraction: α-Sn(001) and InSb(001) surfaces. I.Hernandez-Calderon, H.Hochst (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Phys. Rev. B (USA), vol.27, no.8, p.4961-5 (15 April 1983).
It is shown that from the analysis of intermediate Laue zones of a reflection high-energy electron diffraction pattern it is possible to determine the surface reconstruction in a definite way. The method of analysis is illustrated with the study of α-Sn(001) InSb(001) surfaces. The diamond-structured (α-) tin (001) surface exhibits a two-domain (2×1) reconstruction whereas for InSb(001) a $c(2\times8)$ reconstruction was obtained. These results are in contrast with the respective (2×2) and (2×4) reconstructions reported recently by Farrow et al. using the streak-separation method. (22 refs.)

67325 Atom-probe study of the initial stage of silicide formation. O.Nishikawa, Y.Tsunashima, E.Nomura, M.Wada, S.Horie, M.Shibata, T.Yoshimura, R.Uemori (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.529-33 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The initial stage of silicide formation was investigated utilizing the high mass resolution atom probe. Silicon-deposited Ni and W specimen tips were heated to various temperatures in a vacuum of 10^{-7} Pa. A highly ordered image, which agreed well with the computer-simulated image of WSi_2 with the C11b structure, was observed after heating the tip to 950K. Ni formed a mixed layer with Si even at 80K. The depth profile of the silicide composition changed with temperature due to a high diffusibility of Ni. The silicide formed above 900K consistently showed a well-ordered image corresponding to a cubic structure, while its composition varied from Ni_3Si_2 to NiSi with depth. The computer-simulated image suggests that the observed ordered structure could be a modified Cl structure. The evaporation field of the ordered silicide was found to be significantly higher than those of pure Ni and Si, possibly due to a strong binding between the constituent atoms. (5 refs.)

67326 Stability and reactivity of (001) and (111) NiO: a RHEED-AES investigation of Si surface segregation and Ni formation by gas reduction. N.Floquet, L.-C.Dufour (Lab. de Recherches sur la Reactivite des Solides, Univ. de Dijon, Dijon, France).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.543-9 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
In this contribution are reported recent results regarding the preparation and the reactivity of different nickel oxide (NiO) monocrystalline surfaces. At first, it concerns a structural investigation of metal formation by hydrogen reduction of (001) NiO. In most cases, Ni nuclei form three-dimensional islands as observed by RHEED and corroborated by AES. At low temperatures, metal stacking, previously described as pure HCP stacking from {1120} planes, is shown to develop, in reality, with stacking faults from which FCC stacking is often formed. At high temperatures, metal stacking is retained as within the oxide and, from a comparative transmission electron microscopy investigation, a model for the topotactic nucleus formation is put forward. Secondly, the preparation and the stability of (111) NiO are investigated. Apparent (111) NiO stability is found to be due to the thermal surface segregation of silicon. Even in very low amount, this very mobile impurity segregates at the (111) NiO surface leading to a two-dimensional O-Si-Ni compound. (8 refs.)

67327 Defective nonplanar surfaces of MgO. E.A.Colbourn, J.Kendrick, W.C.Mackrodt (New Sci. Group, ICI plc, Runcorn, England).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.550-7 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Defect lattice and ab initio SCF calculations are reported for defective nonplanar surfaces of MgO. It is suggested that the concentrations of free vacancies and Ca^{2+} are much lower at nonplanar irregularities than at planar surfaces and in the bulk, whereas the levels of Li^+ and trapped holes are higher. The binding of H atoms and CO to three-coordinated corner sites is found to be appreciably higher than to the five-coordinated {001} surface. Thus it is concluded that calcium doping of MgO affects neither CO chemisorption nor the dissociative chemisorption of hydrogen whereas lithium doping influences both. (18 refs.)

67328 Ideally irregular surfaces, of dimension greater than two, in theory and practice. P.Pfeifer (Fakultat fur Chem., Univ. Bielefeld, Bielefeld, Germany), D.Avnir, D.Farin.
Surf. Sci. (Netherlands), vol.126, no.1-3, p.569-72 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Applies Mandelbrot's [1977] concept of fractal (noninteger) dimension D to surfaces. The authors describe how surfaces can provide environments (e.g. for adsorbates) with $2\leq D\leq 3$. Conventional $D=2$ characterizes smooth surfaces; carriers of $D>2$ are 'ideally irregular' (self-similar) surfaces; and $D\rightarrow 3$ is obtained in the limit where a surface visits every point of a volume. The authors present three major methods to get D from experiment. Case studies give ample instances for well-defined $D>2$. Some eminent consequences are inferred. (8 refs.)

67329 A LEIS study of potassium enriched vanadium oxide surfaces. J.P.Landuyt, L.Vandenbroucke, R.de Gryse, J.Vennik (Lab. voor Kristallografie, Rijksuniv. Gent, Gent, Belgium).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.598-604 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
An important surface segregation of potassium to the $V_6O_{13}(001)$ surface is observed. From combined LEED and angular dependent LEIS experiments, it is found that the most probable K site at the $V_6O_{13}(001)$ surface is an interstitial site close to or within the topmost VO layer. It is furthermore shown that on V_6O_{13} the neutralization processes active in He^+ LEIS experiments can be described by the Hagstrum formalism. This result allows a semiquantitative estimation of the surface concentration. A model for the surface structure is presented. (15 refs.)

67330 Distribution of atoms in a ternary alloy with a free surface in the self-consistent field approximation. L.P.Grankina, V.I.Lozovoi, E.F.Ryzhkova, V.I.Ryzhkov (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.8, p.721-5 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.47-52 (Aug. 1982). [received: April 1983]
Analytical form for the functions describing atomic distribution of the components in the subsurface layer of a ternary alloy has been found in a closed form in the self-consistent field approximation, without taking correlation into account. The functions obtained allow one to construct concentration profiles of the components near the surface, to calculate the component surface concentration, and to investigate the dependence of the composition on the surface of the alloy crystal on temperature, and surface relaxation of coordination numbers and energies of the nearest neighbor interatomic interaction in an alloy. An analysis of the character of temperature dependencies of the composition on the surface has been performed for various alloys. (7 refs.)

68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

(for tribology, see 62.20P and 81.40P)

67331 Acoustic surface waves in cubic crystals with overlayers. E.Sanz-Velasco, O.Hardouin Duparc, V.R.Velasco (Inst. de Fisica del Estado Solido, Univ. Autonoma de Madrid, Madrid, Spain).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.202-7 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Systems formed by semi-infinite cubic crystals with cubic overlayers, having (001) free surfaces and interfaces, are considered. The authors study the elastic surface waves of these systems, by using a Green function method, for arbitrary thickness and direction of propagation. Considerable simplification in the solution of the problem can be achieved for small thickness of the overlayer. In this limit they have obtained for the first time the dispersion relation of Rayleigh and Love waves in closed form, to first order in hK ($h\equiv$thickness, $K\equiv$parallel wavevector), for the symmetry directions [100] and [110]. They have studied several systems with $\eta>1$ and $\eta<1$ ($\eta=2C_{44}/C_{11}-C_{12}$). In this way the influence of the overlayer not only on the generalized Rayleigh waves (GRW) but also on the pseudo-surface waves (PSW) for several directions of propagation and different thickness of the overlayer, has been obtained. (11 refs.)

67332 Influence of a static electric field on the properties of Love surface waves in class 622 and 422 piezoelectric crystals. G.G.Kessenikh, L.A.Shuvalov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1690-3 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2985-91 (Oct. 1982). [received: April 1983]
A theoretical study is made of the influence of a static external electric field E on the properties of Love surface waves in a system comprising a piezoelectric substrate made of class 622 or 422 crystals and an isotropic solid insulating layer, either 'soft' or 'hard'. It is shown that there are critical values of E for which Love waves can be formed. The dependence of the dispersion curves of these waves on E is examined. (6 refs.)

67333 Anomalous vibrational states of a monatomic surface film. A.S.Dolgov (N.E. Zhukovskii Kharkov Aviation Inst., Kharkov, Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.7, p.598-600 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.22-5 (July 1982). [received: May 1983]
Vibrational states of a one-dimensional chain of atoms which models peculiarities of a monatomic surface film are considered. A set of nontrivial equilibrium states of the system is determined in whose vicinity almost linear band vibrations are possible. Peculiarities of anomalous branches of vibrational states are discussed. It is shown that the low-frequency gap of vibrational states disappears under certain conditions. This determines the possibility of appearance of low-frequency sound vibrations which are not possible for a trivial equilibrium distribution of atoms in the film. (4 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

67335 Surface plasmons on gratings: coupling in the minigap regions. Y.J.Chen, E.S.Koteles, R.J.Seymour (GTE Labs. Inc., Waltham, MA, USA), G.J.Sonek, J.M.Ballantyne.
Solid State Commun. (USA), vol.46, no.2, p.95-9 (April 1983).
The authors present results of an experimental study of grating coupling to surface plasmons in minigap regions. These results are interpreted, qualitatively, in terms of grating coupling to coupled surface plasmon modes. The observed minigap sizes and the cancellations of the coupling oscillator strengths are related to the coupled mode matrix elements. (13 refs.)

67336 The dispersion relation of surface plasmons on rough surfaces; a comment on roughness data. H.Raether (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).
Surf. Sci. (Netherlands), vol.125, no.3, p.624-34 (March 1983).
Surface plasmons (SP) having the maximum of their intensity in the surface are sensitive to geometric perturbations as roughness or gratings. This influence can be measured by the change of the dispersion relation of the SP. Whereas the results on sinusoidal gratings of Ag and Au can be calculated and agree with the observed results, the situation of statistically rough surfaces is less clear. An attempt is made to display the present situation. The experimental roughness data of 'smooth' (natural roughness) surfaces of silver films and of surfaces with enhanced roughness are collected and their consistency is discussed. There is agreement between the values of the RMS height, δ-5 Å, of 'smooth' vaporised silver films (about 500 Å thick) measured by different authors. The first-order theory describes the results in a satisfactory way. The situation of surfaces of Ag films of 500 Å thickness with enhanced roughness (underlayer of CaF_2), however, is not satisfying since the calculated data of the displacement of the dispersion curve and of the increase of the damping using second-order approximations of the field above the rough metal surface are smaller than the observed data. (41 refs.)

67337 Electronic damping mechanism for vibrations, rotations, and translations of adsorbates on metal surfaces. B.Hellsing, M.Persson, B.I.Lundqvist (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.147-53 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Further theoretical evidence for the importance of the electronic mechanism for the energy exchange between an adsorbate and a metallic substrate is provided by first-principle calculations of the damping of vibrational modes of chemisorbed H and H_2 on free-electron-like metal surfaces and of the friction coefficient of an approaching H atom. In reactive situations, i.e. when a resonance in the adsorbate-induced electron structure crosses the Fermi level of the substrate conduction electrons, enhanced damping is exhibited. With rough estimates for rotational lifetimes added, relevant relaxation times for molecules approaching metal surfaces are briefly discussed. (22 refs.)

67338 Vibrational properties of Au and Pt(110) surfaces deduced from Rutherford backscattering data. D.P.Jackson, T.E.Jackman, J.A.Davies, W.N.Unertl, P.R.Norton (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.226-35 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Rutherford backscattering measurements (RBS) of Pt(110) and Au(110) surfaces, both of which exhibit a (1×2) reconstruction, have been made over the temperature range 160-600K (Pt) and 150-1000K (Au). Angular scans about the [110] and [100] directions have been measured for the (1×2) phase on both materials. Detailed Monte Carlo simulation studies, including the effects of equal-time displacement correlations, have been used to interpret the vibrational properties of this surface phase. The Pt [110] surface peak data provide clear evidence that correlations of the atom vibrations exist and are consistent with those expected from bulk inelastic neutron scattering measurements. This was not the case for the Au[110] surface peak which exhibited higher yields than predicted. (18 refs.)

68.40 SURFACE ENERGY OF SOLIDS; THERMODYNAMIC PROPERTIES

67339 The surface energy of zinc. J.C.Bilello (Dept. of Materials Sci. & Engng., State Univ. of New York, Stony Brook, NY, USA), D.Dew-Hughes, A.T.Pucino.
J. Appl. Phys. (USA), vol.54, no.4, p.1821-6 (April 1983).
The influence of temperature and associated dislocation microstructure on the energies of basal plane cleavage in zinc crystals has been investigated using the method of Hull, Beardmore, and Valentine (HBV). A marked temperature dependence was observed in the zinc surface energy, over the range 77-298K, contrary to previous expectations. Plastic relaxation was associated with crack initiation at 77K, but not propagation; while at room temperature a plastic zone of 1200-1500 μm in depth was produced by crack extension. The surface energy could be estimated, independent of the usual Griffith analysis, by measuring the energy dissipation in a fully relaxed deformed zone associated with an explosively formed precursor crack. This method yielded surface energies of 0.066 to 0.079 J m^{-2} which was in good agreement with previous work. It is demonstrated that the cleaved surface energy of zinc is well below the thermodynamic surface energy and that this discrepancy is not related to plastic deformation. (26 refs.)

68.45 SOLID-FLUID INTERFACE PROCESSES

(see also 82.65 Sorption and accommodation coefficients)

67340 SIMS-AES investigations on water vapour adsorption on nickel (100) at room temperature. K.Uhlmann, F.Storbeck, R.Griessbach (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.469-75 (1983).
By means of the methods SIMS and AES the adsorption of water vapour on the (100) surface of nickel was studied. The authors conclude from the results obtained that the adsorption has three stages: chemisorption of OH groups, formation of a surface hydroxide and finally, formation of an oxide layer containing O and OH. The quantity of oxygen detected corresponded at most to about a monolayer coverage. (17 refs.)

67341 Rotational cooling of rigid rotors desorbed from flat surfaces. J.M.Bowman, J.L.Gossage (Dept. of Chem., Illinois Inst. of Technol., Chicago, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.481-4 (15 April 1983).
A simple model is presented for predicting the final rotational state distribution of an initially physisorbed rigid rotor. Based on the assumptions that the adsorbed rotor is freely rotating and that desorption occurs by a weak coupling between the rotational and desorbing degrees of freedom, a significant rotational 'cooling' is predicted. (21 refs.)

67342 The observation of one-phonon assisted selective desorption and adsorption of He atoms in defined vibrational levels on a LiF (001) single crystal surface. G.Lilienkamp, J.P.Toennies (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).
J. Chem. Phys. (USA), vol.78, no.8, p.5210-24 (15 April 1983).
By choosing the appropriate incident angle it has been possible to inject the nearly monoenergetic ($\Delta\nu/\nu \approx 1\%$)He atoms of an incident beam (18 meV) into one of the four bound states of the atom-LiF(001) surface potential. The final angular distributions of the atoms which have been inelastically scattered by phonons out of these bound states have been measured for the ⟨100⟩ and ⟨110⟩ directions of LiF (001). For the low-lying states these distributions are peaked at large final angles ($\approx 75°$) near grazing and are different from the distributions for the atoms directly inelastically scattered. The time of flight distributions indicated a predominance of annihilation events indicating that the atoms have been ejected by gaining the minimum amount of energy for release from the surface. The initial angle distribution of He atoms inelastically entering the $\langle 110\rangle \nu = 0$ ground state could also be measured by monitoring the flux at a unique magic angle at which the atoms can leave this state by the reverse of selective adsorption. The time of flight spectra reveal that the atoms in this case were trapped by a creation process. The two processes of adsorption and desorption are related by microscopic reversibility. The results are discussed in terms of a simple quantum resonance theory. (45 refs.)

67343 Theoretical studies of surface diffusion: A strategy of enhanced sampling. J.D.Doll, H.K.McDowell, S.M.Valone (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5276-7 (15 April 1983).
Recent studies have demonstrated the feasibility and utility of numerical molecular dynamics simulation methods in the study of surface diffusion. Such methods have yielded surface diffusion constants which are in quantitative agreement with those measured by field ion microscope techniques. The authors describe an attempt to reduce the rather large computational effort involved in these studies by devising improved numerical sampling techniques. To test this point they have examined a set of molecular dynamics trajectories for single adatom surface diffusion on W(110). (9 refs.)

67344 Cluster studies of CO adsorption. III. CO on small Cu clusters. D.Post, E.J.Baerends (Scheikundig Lab., Vrije Univ., Amsterdam, Netherlands).
J. Chem. Phys. (USA), vol.78, no.9, p.5663-81 (1 May 1983).
For pt.II see Suf. Sci., vol.116, p.177 (1982). Chemisorption of CO on (100) and (111) Cu surfaces has been investigated by calculations on a series of small clusters. The dependency of the results on both the adsorption site (top or hollow) and the size of the cluster has been analyzed using a decomposition of the adsorption energy in various terms (steric repulsion, σ bonding, π backbonding). Some properties, i.e. M-CO distance, M-CO vibration, C-O distance, can be obtained from small cluster calculations as they are determined by 'local' bonding aspects, whereas, e.g. the adsorption energy is not reliable due to delocalized features of the bonding being not well represented by small clusters. The deficiency of small cluster in modeling the polarizability of a metal substrate is stressed. (52 refs.)

67345 The vibration spectrum of hydrogen bound by nickel catalysts. C.M.Sayers (Materials Phys. Div., AERE, Harwell, England).
J. Phys. C (GB), vol.16, no.12, p.2381-90 (30 April 1983).
The amplitude-weighted vibrational density of states of hydrogen adsorbed on nickel (100) and (111) surfaces is computed and compared with inelastic neutron scattering data on nickel catalysts. Local modes at 113 meV and 140 meV are interpreted as being due to vibrations of hydrogen parallel and perpendicular to the surface at a three-coordinated site respectively. A peak at 80 meV is interpreted as arising from vibrations of hydrogen perpendicular to the surface at a four-coordinated site. The relative intensities of the local modes in the data suggest that the three-coordinated site is the preferred site for adsorption on nickel catalysts. However the measured density of states below 300 cm^{-1} indicates some occupancy of four-coordinated sites in agreement with the existence of a peak at 80 meV. (20 refs.)

67346 Electronic criteria for distinction between weak and strong ionosorption. A.Luyckx (Lab. de Phys.-Chimie, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.559-63 (1983).
Three different types of ionosorption on pellets of compressed powder of cobaltous oxide have been observed by measurements of the electrical conductance. (a) When a powder is efficiently outgassed, an instantaneous ionosorption of oxygen is characterised by an increase in conductance, while a sudden decrease of conductance appears when hydrogen is introduced instead of oxygen. (b) A slow change of conductance starts, less than an hour after the first phase of instantaneous ionosorption, and goes on during several days. A parallel shifting of the semilog straight lines of the resistance vs. absolute temperature, has generally been observed below a threshold temperature of 85°C. (c) Beyond this threshold of temperature, a simultaneous shifting and revolving of the semilog lines has been established. Their slopes increase in hydrogen and decrease in oxygen ambience. Water vapor was detected at and beyond this threshold. This temperature, beyond which the revolving starts, is the same for hydrogen, oxygen or carbon monoxide ambience. The parallel shifting of the semilog lines and the meaning of the threshold of 85°C has been interpreted following two possible assumptions. (9 refs.)

67347 Study of gas relative permeability in a mesoporous alumina pellet. N.K.Kanellopoulos, J.H.Petropoulos (Phys. Chem. Lab., Demokritos Nuclear Res. Centre, Athens, Greece).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, no.2, p.517-25 (Feb. 1983).
The helium relative permeability of an alumina mesoporous pellet partially blocked by sorbed CCl_4 has been studied on both sorption and desorption branches of the sorption isotherm. The plot of relative permeability (P_R) against the amount of CCl_4 sorbed (ν_s) is concave upwards; this is in contrast to the initially convex upwards curve reported previously for microporous Carbolac carbon containing paraffin sorbates, but in agreement with some preliminary computations based on a capillary-network model. Differences between the P_R against ν_s plots for the sorption and desorption branches of the isotherm are not significant in relation to the repeatability of the results. (14 refs.)

67348 Theory of chemisorption on surfaces of ferromagnetic metals. H.Kasai, A.Okiji (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan), A.Yoshimori.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.22-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The effect of electron correlation on the surfaces of ferromagnetic metals and chemisorbed atoms on them is investigated within the alloy analogy of the Hubbard second approximation. It is shown that the presence of surfaces diminishes local magnetic moments and that adatoms may have a similar effect. (10 refs.)

67349 SEXAFS studies of adsorbate structure on Si and Ge surfaces. P.H.Citrin, J.E.Rowe, P.Eisenberger, F.Comin (Bell Labs., Murray Hill, NJ, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.786-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Surface extended X-ray absorption fine structure studies of Cl, L, and Te adsorbed on Si and Ge surfaces reveal in some cases unexpected adsorption site variations and bond lengths. Iodine and chlorine occupy the atop site on both Si{111}7×7 and Ge{111}2×8 whereas Te occupies two distinct and previously unreported bridging sites on these surfaces. The Cl site identification on Si{111}7×7 is consistent with previously reported UPS and theoretical work whereas on Ge{111}2×8 it is not. Comparison between surface and bulk bond lengths suggests π bonding for Si surface atoms. (10 refs.)

67350 Chemisorption and electronic charge transfer at ionic semiconductor surfaces. W.Gopel (Phys. Dept., Montana State Univ., Bozeman, MT, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.789-91 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Effective charges attributed to surface atoms at single crystal polar or nonpolar surfaces of ionic semiconductors are unchanged only by less than one percent as compared with bulk values. Formation of intrinsic point defects or extrinsic chemisorption-induced defects, however, may lead to significant charge redistribution and hence to significant changes in core-level binding energies as well as valence band features. The energies relative to the Fermi energy of uppermost occupied electronic states attributed to neutral, negative, and positive adsorption complexes determine the direction of an additional delocalized charge exchange between free electrons in the semiconductor and defects or adsorption complexes. (5 refs.)

67351 Aspects of chemisorption in partially ionic semiconductors. C.Calandra (Istituto di Fisica, Univ. di Modena, Modena, Italy).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.804-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A review is presented of some recent results about the electronic and structural properties of chemisorbed species on III-V semiconductor surfaces. The chemisorption of hydrogen and group V elements on GaAs (110) surface is discussed in detail. (27 refs.)

67352 Transitions of an internal degree of freedom within an incommensurate phase. J.L.Cardy, M.P.M.den Nijs, M.Schick (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4251-5 (1 April 1983).
The authors consider molecules which are adsorbed on a substrate in either a commensurate or a floating-solid phase and which exhibit a transition due to the ordering of an internal degree of freedom. They show that the thermodynamic singularities associated with the transition in the floating-solid phase, below the dislocation-unbinding temperature, are the same as in the commensurate phase. This contrasts with the expected difference in the wave-vector singularities of the scattering response function. The case of orientational ordering in N_2 adsorbed on graphite is treated explicitly . They also note that in cases in which the interaction between the internal degrees of freedom is strong, the melting of the floating-solid phase can be significantly altered. (20 refs.)

67353 GaAs (001)-*c*(4×4): a chemisorbed structure. P.K.Larsen (Philips Res. Labs., Eindhoven, Netherlands), J.H.Neave, J.F.van der Veen, P.J.Dobson, B.A.Joyce.

Phys. Rev. B (USA), vol.27, no.8, p.4966-77 (15 April 1983).

The authors have carried out an experimental study of the As-stable GaAs(001)-*c*(4×4) reconstruction using a combination of molecular-beam epitaxy with reflection electron diffraction, angle-resolved photoemission, and surface-sensitive core-level photoemission. (The measurements were performed at Laboratoire pour l'Utilisation du Rayonnement Electromagnetique, Universite Paris-Sud, Orsay, France). Apart from the surface symmetry, the electron diffraction data show one-dimensional disorder along the [110] direction, probably corresponding to a corrugated-sheet structure in reciprocal space. photoemission from surface states having dangling-bond character shows a one-fold periodicity and an energy dispersion of 0.65 eV along [110], while along [110] the dispersion is much smaller but there is a doubling of the periodicity. Observations of the As 3*d* and Ga 3*d* core levels show a surface As 3*d* component at 0.62 eV higher binding energy than the bulk component, indicative of As-As bonding. The Ga 3*d* surface core-level shift is very small and the line shape is similar to that from the (2×4) surface. The experimental results can be understood on the basis of an As overlayer structure, for which they propose specific models derived from trigonally bonded chemisorbed As. (35 refs.)

67354 Theory of photodesorption of molecules by resonant laser-molecular vibrational coupling. Z.W.Gortel, H.J.Kreuzer (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada), P.Piercy, R.Teshima.

Phys. Rev. B (USA), vol.27, no.8, p.5066-83 (15 April 1983).

Photodesorption due to a laser resonantly coupled into an internal vibrational mode of an adsorbed molecule is considered. Based on a master equation with transition probabilities calculated quantum statistically for laser-induced vibrational transitions, phonon-mediated bound-state-bound-state and bound-state-continuuum transitions, and tunnelling transitions from bound states degenerate with the continuum, the authors calculate desorption rates as a function of temperature and laser intensity. They are highly nonlinear in both, and become saturated for high intensities. The theory is applied to the CH_3F-NaCl and CO-NaCl systems. (28 refs.)

67355 Electronic friction and covalent chemisorption. K.Schonhammer (I. Inst. fur Theoretische Phys., Univ. Hamburg, Hamburg, Germany), O.Gunnarsson.

Phys. Rev. B (USA), vol.27, no.8, p.5113-15 (15 April 1983).

The energy loss to low-energy electron-hole pairs in the process of sticking at metal surfaces is discussed for atoms or molecules which form a covalent chemisorption bond. Using the Friedel sum rule it is shown that a different symmetry behavior of the highest occupied molecular orbital and the lowest unoccupied molecular orbital is favorable for larger electronic friction. (22 refs.)

67356 Drastic reduction of adsorption of CO and H_2 on (111)-type Pd layers. H.Poppa, F.Soria (Stanford NASA Joint Inst. for Surface & Microstructure Res., NASA Ames Res. Center, Moffett Field, CA, USA).

Phys. Rev. B (USA), vol.27, no.8, p.5166-8 (15 April 1983).

Clean surfaces of (111)-type Pd layers, grown from the vapor phase on Mo(110) at room temperature, were used to study the adsorption of CO and H_2 by temperature-programmed desorption, Auger electron spectroscopy, and low-energy electron diffraction. Mild annealing of the as-grown layers during a single desorption cycle (to about 600K) drastically reduces the adsorption for both adsorbates. Low-dose argon-ion bombardment introduces surface imperfections which restore a high adsorption probability. The results are interpreted in terms of particular (111)-type surface structures that persist to layer thicknesses of about four monolayers, the results raise questions with respect to the surface structure of supported thin epitaxial islands and particles of Pd and possibly also with respect to conventional methods of preparing bulk surfaces of Pd for adsorption studies. (13 refs.)

67357 Dissociation of water molecules on Si surfaces. S.Ciraci, H.Wagner (Inst. fur Grenzflachenforschung und Vakuumphys., KFA Julich, Julich, Germany).

Phys. Rev. B (USA), vol.27, no.8, p.5180-3 (15 April 1983).

Molecularly adsorbed water is weakened due to the chemisorption bond between oxygen and surface silicon and has a Fermi level lying in the conduction band. This unstable binding structure dissociates to yield a lower-energy configuration. Binding structures that may result from the dissociation in the temperature range from 300 to 750K are discussed. With state-density calculations it is demonstrated that a dissociative binding structure, in which OH and H are chemisorbed to closely lying surface silicon atoms, accounts for the room-temperature ultra-violet photoemission spectrum. (14 refs.)

67358 LEED investigation of mixed layers of carbon and sulfur on cobalt. M.Maglietta, A.Fallavollita, G.Rovida (Univ. di Firenze, Firenze, Italy).

Solid State Commun. (USA), vol.46, no.3, p.273-6 (April 1983).

The structure of mixed layers of carbon and sulfur on the Co(001) face was investigated by LEED as a function of composition. The results indicate that C and S atoms do not form separate islands, but are present in the same domains on neighbour sites. Several models are discussed, on the basis of the structure of the pure phases $c(2\times2)-S$, $p(2\times2)-S$ and $p(2\times2)-C$ on Co(001), which are shown to be nearly the same as those reported for the Ni(001) face. (9 refs.)

67359 Temperature induced structural changes for coadsorbed H and CO on Ni(100). H.C.Peebles, D.E.Peebles, J.M.White (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

Surf. Sci. (Netherlands), vol.125, no.3, p.L87-92 (March 1983).

Low energy electron diffraction (LEED) data are reported which show interesting changes with temperature in the structure of carbon monoxide adsorbed on hydrogen-presaturated Ni(100). These results are compared with vibrational and electron spectroscopy data, and some structural models are proposed. (10 refs.)

67360 Adsorption of N_2 and NH_3 on Mo(111). C.Egawa, S.Naito, K.Tamaru (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).

Surf. Sci. (Netherlands), vol.125, no.3, p.605-12 (March 1983).

The surface structure of the Mo(111) plane in the adsorption of N_2 and NH_3 has been investigated by means of low energy electron diffraction (LEED). The adsorption of N_2 and NH_3 at room temperature shows no extra new LEED spots except for an increase of the background intensity. Heating of this surface to 850K or higher caused faceting of the (111) surface to produce the (443) face of molybdenum. On this surface only nitrogen atoms are adsorbed; it exhibits the c(3×2) in-registry overlayer structure of the (443) face from the low nitrogen coverage to the saturated one, 0.35, which is determined by the nitrogen Auger intensity. This saturated coverage is consistent with the surface coverage of the c(3×2) overlayer structure (0.33). The sticking coefficient of N_2 adsorption is about 0.05 and it is constant irrespective of the coverage, which suggests island formation of superstructure on the surface. On the other hand, the sticking coefficient at room temperature is only slightly larger than at 850K. Photoemission spectra obtained from He I or He II also revealed the same atomic nitrogen level at about 5 eV, indicating that the electronic state of the nitrogen atoms is the same at both temperatures. (8 refs.)

67361 The adsorption study of tellurium on iron (001) surface by means of LEED, AES and $\Delta\phi$. S.Nakanishi, T.Horiguchi (Dept. of Phys., Univ. of Osaka Prefecture, Sakai, Japan).

Surf. Sci. (Netherlands), vol.125, no.3, p.635-52 (March 1983).

A study of tellurium adsorption onto the iron single crystal (001) surface has been made by means of LEED, AES and $\Delta\phi$ techniques. LEED observations showed the formation of p(2×2), c(2×2), and the antiphase domain structures (associated with these structures at low coverages ($\theta<0.7$)). The results of the Auger study revealed the layer growth of adatoms, which was characterized by pronounced linear segments in Auger uptake curves. The work function change was also measured. It showed monotonous increase at low coverage ($\theta<0.5$) followed by a subsequent maximum and minimum at further coverages ($\theta<0.7$). The details of this behavior were discussed in connection with the LEED and AES results. (21 refs.)

67362 Angular resolved flash desorption of carbon monoxide from tungsten (100). D.R.Horton, R.I.Masel (Dept. of Chem. Engng., Univ. of Illinois, Urbana, IL, USA).

Surf. Sci. (Netherlands), vol.125, no.3, p.699-708 (March 1983).

Carbon monoxide desorption from tungsten (100) is studied using angular resolved thermal desorption spectroscopy. The flux of α-CO is found to vary as $\cos\theta$, where θ is the angle between the surface normal and the detector centerline, while the flux of β_1-CO is found to vary as $\cos^4\theta$, the flux of β_2-CO is found to vary as $\cos^3\theta$ and the flux of β_3-CO is found to vary as $\cos\theta$ or $\cos^2\theta$. These results suggest that there are rearrangements of the tungsten surface during desorption of β-CO. It is suggested that these arrangements create the three-peak β structure normally observed. The data demonstrate that absorption and desorption are not necessarily related by microscopic reversibility when the adsorption and desorption temperatures are different. (16 refs.)

67363 Low temperature coadsorption of hydrogen and carbon monoxide on Ni(100). I. TPD, $\Delta\phi$, and UPS studies. B.E.Koel, D.E.Peebles, J.M.White (Dept., of Chem., Univ. of Texas, Austin, TX, USA).

Surf. Sci. (Netherlands), vol.125, no.3, p.709-38 (March 1983).

Ultraviolet photoemission (UPS), work function change ($\Delta\phi$) and temperature programmed desorption (TPD) data are reported for carbon monoxide and hydrogen coadsorbed in Ni(100). Predosed hydrogen and postdosed carbon monoxide are intimately mixed and strongly coupled on Ni(100) at 100K, but there is no evidence for direct C-H or O-H bonding. TPD shows sharp desorption peaks of both CO and H_2 around 210K (Σ states). UPS shows that a single type of weakly adsorbed CO, Σ-CO, exists on an H-presaturated Ni(100) surface at 100K. This species is irreversibly converted to β-CO after heating to 260K to desorb some CO and H_2. The chemical bonding of the adsorbed CO changes significantly with the conversion from Σ to β-CO. Work function measurements show that the surface dipole associated with Σ-CO is nearly zero. The results suggest that Σ-CO has an electronic structure readily derivable from chemisorbed CO perturbed by a through-Ni interaction with hydrogen bonded to the same Ni atom or atoms. (94 refs.)

67364 Low temperature coadsorption of hydrogen and carbon monoxide on Ni(100). II. ELS and XPS studies. B.E.Koel, D.E.Peebles, J.M.White (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

Surf. Sci. (Netherlands), vol.125, no.3, p.739-61 (March 1983).

For pt.I see ibid., vol.125, no.3, p.709 (1983). Electron energy loss spectroscopy (ELS) and X-ray photoelectron spectroscopy (XPS) have been used to characterize CO adsorbed alone and coadsorbed with hydrogen on Ni(100) at low temperatures. Evidence is presented for a significantly weaker bond between CO and the substrate in the presence of coadsorbed hydrogen as compared to CO adsorbed alone. This is reflected by a growth of satellite intensity and a shift to higher binding energy of XPS C(1s) and O(1s) core lines when hydrogen is present. The ELS data show that the splitting between the $2\pi_b$ and $2\pi_a$ levels decreases when hydrogen and CO are coadsorbed. (54 refs.)

67365 Molecular orbital study of CO chemisorption on a Pt(111) surface in the presence of potassium. N.K.Ray, A.B.Anderson (Chem. Dept., Case Western Reserve Univ., Cleveland, OH, USA).

Surf. Sci. (Netherlands), vol.125, no.3, p.803-12 (March 1983).

A molecular orbital study was made, using an atom superposition and electron delocalization (ASED) technique, to examine the chemisorptive properties of CO on a Pt(111) surface in the presence of coadsorbed potassium atoms. To understand the effect of preadsorbed K on CO chemisorption, the authors have studied the adsorption of K on a cluster model of a Pt(111) surface. K is predicted to be preferentially adsorbed at a three-fold position and the calculated binding energy is in reasonable agreement with other estimates. K adsorption is found to lead to a significant charge transfer which in turn increases the electron density of all surface Pt atoms. The presence and increasing coverage of K on the Pt(111) surface has been simulated by decreasing the valence state ionization potential of Pt atoms in the cluster models. With the decreasing values (i.e. with increasing K coverage), the CO molecule is predicted to change its site of occupation from a one-field position to the two-fold or three-fold positions. The CO stretching force constant is predicted to decrease for all the sites with decreasing VSIP values of Pt. They find the decrease in CO force constant on going from the one-fold to two-fold site is smaller than the decrease on going from the one-fold to three-fold site. (23 refs.)

67366 Chemisorptive properties of Pt-Ni(111) single crystal alloys with high platinum content: C_2H_4 and C_6H_6 adsorption. J.Massardier, B.Tardy, M.Abon, J.C.Bertolini (Inst. de Recherches sur la Catalyse, CNRS, Villeurbanne, France).

Surf. Sci. (Netherlands), vol.126, no.1-3, p.154-62 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).

The chemisorption of ethylene and benzene has been investigated on $Pt_{78}Ni_{22}$ and $Pt_{50}Ni_{50}$(111) single crystal alloys by vibrational electron energy loss spectroscopy and thermal desorption spectroscopy. These alloys exhibit a strong platinum segregation leading to a quasi-complete platinum layer on the surface. On $Pt_{78}Ni_{22}$(111), the hydrocarbonated surface complexes formed after C_2H_4 and C_6H_6 adsorption show the same main features as these recorded on Pt(111). However, evidence for more weak interactions with the metal surface is obtained. On $Pt_{50}Ni_{50}$(111), no C_2H_4 and C_6H_6 adsorption has been obtained, even at 180K. These results evidence the specific behaviour of the superficial layers of quasi-pure platinum supported on the bulk alloys with respect to pure platinum: a decrease of chemisorption strengths is observed after alloying, which is much more pronounced on the $Pt_{50}Ni_{50}$ sample. (19 refs.)

67367 Vibrational excitations of hydrogen and oxygen on Pd(100). C.Nyberg, C.G.Tengstal (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.163-9 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Angle resolved high resolution electron energy loss spectroscopy (EELS) and low energy electron diffraction (LEED) has been used to study the adsorption of hydrogen and oxygen on Pd(100). Hydrogen adsorbs dissociatively at all temperatures studied ($T>10$K) and nucleates into c(2×2) islands for $T<260$K. A dipole excited loss at 64 meV is observed and is attributed to atomic adsorption in the hollow site somewhat above the Pd surface. Oxygen is dissociatively adsorbed at room temperature and forms a p(2×2) structure. A vibrational mode at 44 meV is detected implying adsorption in the hollow position. At low temperature ($T<110$K) both atomic and molecular adsorption occurs. A loss at 90 meV is assigned to the intramolecular stretch vibration of associatively adsorbed oxygen. Coadsorption of oxygen and hydrogen at low temperature ($T\simeq80$K) yields a disordered overlayer. Raising the temperature caused ordering and redistribution of the overlayer. Finally at 300K, hydrogen and oxygen reacts to form water which desorbs from the surface. (10 refs.)

67368 Infrared-laser-induced desorption by resonant multiphoton excitation of adsorbate vibration in CH_3F-NaCl at different coverages. J.Heidberg, H.Stein, E.Riehl (Inst. fur Phys. Chem. und Elektrochem., Univ. Hannover, Hannover, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.183-91 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Desorption induced by resonant CO_2 laser pulses in CH_3F-NaCl(film) on NaCl(100) single crystal surfaces at different coverages has been observed. The primary acctivation step is the multiphoton excitation of the most intense internal adsorbate vibration, the C-F stretching mode ν_3. The variation of desorption yield with laser frequency was measured at constant fluence and coverage and was correlated with the corresponding linear absorption spectra. From desorption yield versus laser fluence plots, rate coefficients and characteristic minimum energy fluence values ϕ_s for desorption at different surface coverages have been determined, showing increasing ϕ_s with decreasing coverage at constant excitation frequency. By appropriate choice of laser frequency and fluence, it is possible to separate different adsorption phases by desorption. (15 refs.)

67369 Preferential orientation of formic acid adsorbed on Al oxides. M.Liehr, S.Ewert (II. Phys. Inst., Rheinisch-Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.208-13 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The vibrational spectra of HCOOH (DCOOD) molecules adsorbed on Al oxide tunnel barriers are studied by inelastic electron tunneling spectroscopy. The (Al/Al oxide/Pb) tunnel junctions are prepared in situ in an ultrahigh vacuum cryostat. It is concluded that the format adsorbs with a preferred orientation on microcrystalline Al oxide, whereas on amorphous Al oxide there is a rather random orientation. (15 refs.)

67370 The two state nature of H-induced W(100) reconstruction. E.F.J.Didham, W.Allison, R.F.Willis (Dept. of Phys., Univ. of Cambridge, Cambridge, England).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.219-25 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The authors present electron energy loss analysis of the hydrogen induced commensurate-incommensurate displacive phase transition on the W(100) surface. Coverage dependent results indicate that the transition from the $(\sqrt{2}\times\sqrt{2})$ to the (1×1) phase occurs via a tilted dimer model for the intermediate incommensurate phase. The combination of both lateral and vertical shafts of the substrate W atoms is indicative of mixing between two lattice vibrational modes: the Rayleigh branch with displacements normal to the surface plane, and a phonon branch with displacements parallel to the surface. The temperature dependent results clearly provide evidence for both states which play an important role in order-disorder (particularly) and first order (possibly) phase transitions. (15 refs.)

67371 SO_2 adsorption and desorption kinetics on Pt(111). U.Kohler, H.-W.Wassmuth (Fachbereich Phys., Univ. Marburg, Marburg/Lahn, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.448-54 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
SO_2/Pt(111) adsorption and desorption kinetics in the temperature range 160-300K were investigated by a molecular beam technique and TDMS measurements. The initial sticking probability $s_{SO(2)}{}^0$ turns out to be unity independent of surface temperature, and the $s_{SO(2)}(\theta)$ curves indicate the operation of a precursor mechanism. The TDMS spectra of SO_2 could be analysed by means of second order desorption kinetics indicating that SO_2 seems to be adsorbed dissociatively even at low temperatures (at least for small coverages). The resulting kinetic parameters are interpreted as values determining the recombination process $(SO)_{ad}+O_{ad}\rightarrow(SO_2)_{ad}$, assuming the SO_2 molecule to desorb directly. Combining these results with those on SO dissociation and recombination, it was possible to construct a potential energy diagram for sulfur-oxygen reactions on Pt(111). (13 refs.)

67372 Chlorine and iodine adsorption on the Ta(100) and Ta(110) surfaces. Z.T.Stott, H.P.Hughes (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.455-62 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The interaction of chlorine and iodine with the Ta(100) and Ta(110) surfaces, the two most densely packed BCC planes, has been investigated using LEED and Auger electron spectroscopy. Both halogens are readily adsorbed at room temperature. It appears that adsorption occurs dissociatively, via a mobile precursor state, with high initial sticking probability. LEED indicates that room temperature adsorption on the Ta(100) surface is disordered while both surfaces form series of temperature and coverage dependent phases above room temperature. The decrease in work function noted during chlorine and iodine adsorption on the Ta(110) surface is discussed and compared with other halogen systems which show a similar unexpected decrease. Characteristic energy loss peaks in the region 8 to 50 V below the elastic peak have been investigated and peak assignments made for both clean and halogen covered surfaces. (26 refs.)

67373 Effect of the repulsion between adsorbed atoms on their diffusion on the surface of a crystal. A.A.Tarasenko, A.A.Chumak (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1683-5 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2972-7 (Oct. 1982). [received: April 1983]
The diffusion coefficient of adsorbed atoms (adatoms) with a repulsive adatom-adatom interaction is calculated in the self-consistent field approximation. It is shown that the diffusion coefficient changes discontinuously at phase transition points of the system of adatoms (transitions between disordered and ordered states or transitions between different ordered states). Such a dependence of the diffusion coefficient on the adatom concentration is due to a change in the interaction of adatoms with their surroundings which takes place during a phase transition in a system of adatoms. (5 refs.)

67374 Molecular orbital study on the interaction of Ni and Cu atoms with oxygen-containing organic ligands and its implication to adsorption. H.Itoh (Inst. of Phys. & Chem. Res., Saitama, Japan).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.477-82 (April 1983).
The interactions of Ni and Cu atoms with CH_3OH and H_2CO ligands were studied by means of ab initio MO calculations. The metal atom-ligand bond length is shorter for Ni than for Cu. Correspondingly, the binding energy is larger for Ni than for Cu. The difference in adsorptive properties of Ni and Cu is explained by the difference in their electronic structures. Alloying effects are discussed. The interaction of the Cu atom with the CH_3O radical is also calculated. (34 refs.)

68.48 SOLID-SOLID INTERFACES

(inc. bicrystals; for grain boundaries, see 61.70N)

67375 Formation of $MoSi_2$ by pulsed electron beam irradiation onto a vapor deposited molybdenum/silicon structure. S.Suzuki (Advanced Materials Lab. Inc., Saitama, Japan), Y.Ohkubo, F.Matsuoka, T.Itoh.
Appl. Phys. Lett. (USA), vol.42, no.9, p.797-9 (1 May 1983).
A molybdenum disilicide layer was formed by pulsed electron beam irradiation into a vapor deposited Mo film on a Si substrate. The electron beam with a duration of almost 1 μs was generated by glow discharge of He at a pressure of 1×10^{-5} Torr in a vacuum chamber equipped with a capacitor of 1μF that was charged at 7 kV. The total energy stored in the capacitor was 25 J and the irradiated area was almost 1 in. in diameter. The qualitative and structural characterizations were performed by Auger electron spectroscopy

(AES), transmission electron diffraction (TED), and transmission electron microscopy (TEM). A depth profile by AES showed that a uniform $MoSi_2$ layer was formed toward the Mo surface from the Mo/Si interface and that C and O contaminants were swept away from the silicide. The hexagonal $MoSi_2$ phase was uniquely identified in the irradiated layer and the TEM micrographs showed uniform polycrystalline grains of a size of 800 Å. (7 refs.)

67376 Microstructural features of Zircaloy-2 and stainless steel AISI-304 L electron beam joint. P.Gr.Lucuta, D.Topa, E.Vasile (Intreprinderea de Cercetare si Productie de Piese Forjate si Turnate Pentru Aviatie, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.9, p.799-804 (1982). In Rumanian.
Diffusion bonding between stainless steel AISI-304 L and Zircaloy-2, as a result of the electron beam impact with the steel (100 μm near the original interface) shows two distinct zones formed by the mutual diffusion of constituent elements. SEM and microanalysis were used to obtain information about the structure and composition of the two diffusion zones, each separately formed in the stainless steel and Zircaloy matrices. The distribution and concentration of constituent elements in the diffusion zones can be explained in connection with the operating diffusion mechanism. (6 refs.)

67377 Investigation of the Cu/GaAs(110) interface formation. D.Bolmont, V.Mercier, P.Chen, H.Luth, C.A.Sebenne (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.509-17 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Low energy electron diffraction (LEED), Auger electron spectroscopy (AES), electron energy loss spectroscopy (ELS) and photoemission yield spectroscopy (PYS) measurements are performed on a set of UHV cleaved n- and p-GaAs(110) crystal surfaces as a function of Cu coverage θ obtained by in-situ evaporation in the range $10^{-3} \lesssim \theta \lesssim 200$ monolayers (ML). A model of interface formation is developed where, first, a uniform nonmetallic double layer, including a two-dimensional compound associating Cu, As and Ga atoms, forms to be completed below 2 ML; then, growth of metallic Cu islands occurs. It explains the full set of experimental results, including the observed electron state density changes at the interface and the characteristics of the Schottky barrier formation. (13 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

67378 Non-destructive determination of composition and thickness of multi-component alloy thin films by X-ray fluorescence spectroscopic method. Cheng Jian-Bang, Cheng Wan-Rong, Wang Xi-Hong (Inst. of Phys., Acad. Sinica, Peking, China), Hao Gog-Zhang, Wu Zhang-Cun.
Acta Phys. Sin. (China), vol.32, no.2, p.251-5 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
A non-destructive method for determination of composition and thickness of ternary alloy thin film by using the technique of X-ray fluorescence spectroscopy, is employed in this paper. In this method, it is not necessary to prepare any similar solid or pure elemental standards, instead, the filter disk standards are used. These disk standards can be made readily and are stable for long period of time. A set of equations relating the characteristic X-ray intensities from elements in the film and its surface densities are formulated and solved for for film composition. The quantitative dependence of attenuation of characteristic X-ray intensities of elements in substrate on increasing film thickness is used to determine the thickness. This method can be used to measure the film composition and thickness simultaneously. (10 refs.)

67379 Morphogenetic aspects of the LPE heterostructure growth: time evolution of configuration entropy. F.Srobar (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.321-8 (1983).
The concept of the configuration entropy ΔS_{conf}, introduced originally in the context of heterojunction superlattices, is extended to cover general one-dimensional concentration profiles. Changes in ΔS_{conf} as well as in its production rate $P_{conf}=d\ \Delta S_{conf}/dt$ accompanying the growth of single and double $Al_xGa_{1-x}As$ based heterostructures are evaluated for a suitable set of relevant parameters. $-\Delta S_{conf}$ is shown to increase monotonously during the growth process, while the $-P_{conf}$ vs. t dependences may exhibit sharp maxima and discontinuities in response to movements of the LPE apparatus slide. Given the fact that ΔS_{conf} measures departure of the atomic population from the homogeneous (macroscopically structureless) equilibrium condition, such studies in effect monitor time distribution of the morphogenetic activity by the LPE growth processes. (11 refs.)

67380 Stabilization of the melt composition in Ga-Al-Sb-As. A.N.Baranov, S.G.Konnikov, T.B.Popova, V.E.Umansky, Yu.P.Yakovlev (A.F. Ioffe Phys. Tech. Inst., Acad. of Sci., Leningrad, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.349-53 (1983).
The authors present a new effect of stabilization of the Ga-Al-Sb-As melt composition when it is in contact with a GaAs substrate. It was found that the As content in the Ga-Al-Sb-As melt did not depend on the initial Sb concentration when the liquid phase was formed by saturating the Ga-Al-Sb melt from the GaAs substrate. This effect is supposed to be due to the change in phase equilibria conditions caused by large lattice mismatch between the substrate and the solid in equilibrium with the liquid. (10 refs.)

67381 Doping mechanism and properties of Zn-doped GaN-epitaxial layers. V.M.Andreev, M.N.Petrov, I.G.Pichugin (V.I. Uljanov Leningrad Electrical Engng. Inst., Leningrad, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.435-44 (1983).
The role of oxygen in the process of doping GaN with Zn is established. It is shown theoretically and experimentally that Zn is dissolved in GaN in the form of Zn-O complexes when oxygen or water vapour is present in the ambient of the growth reactor. Most of the complexes are neutral. Only the small part of Zn introduced is situated in electrically active positions. This fact can explain the enormously high Zn concentration which is necessary to obtain the compensation of GaN native donors. The electrical and luminescence properties of GaN epitaxial layers doped by Zn are studied and the relation of these properties to the growth and doping conditions is considered. (17 refs.)

67382 Iso-epitaxial growth of n-octacosane crystals. P.B.V.Prasad, I.V.K.Bhagavan Raju.
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.445-50 (1983).
Iso-epitaxial (epilayer) growth of n-octacosane crystals is reported. The morphology of the epilayers is in the form of triangular growth islands with or without truncature. Epilayer growth precedes spiral growth mechanism which occurs at medium and low supersaturations, respectively. The occurrence of triangular and truncated rhombic platelets is found to be a manifestation of growth at medium supersaturations. (21 refs.)

67383 Dynamics of film growth of GaAs by MBE from RHEED observations. J.H.Neave, B.A.Joyce (Philips Res. Labs., Redhill, England), P.J.Dobson, N.Norton.
Appl. Phys. A (Germany), vol.A31, no.1, p.1-8 (May 1983).
Detailed observations have been made of the intensity oscillations in the specularly reflected and various diffracted beams in the RHEED pattern during MBE growth of GaAs, $Ga_xAl_{1-x}As$ and Ge. The results indicate that growth occurs predominantly in a two-dimensional layer-by-layer mode, but there is some roughening, which is enhanced by deviations from stoichiometry and the presence of impurities. In the case of the GaAs (001) -2×4 reconstructed surface a combination of dynamic and static RHEED measurements has provided firm evidence for the presence of one-dimensional disorder features as well as surface steps. (22 refs.)

67384 Effect of lattice mismatch on the solidus compositions of $Ga_xIn_{1-x}P$ liquid phase epitaxial crystals. J.Ohta, M.Ishikawa, R.Ito, N.Ogasawara (Dept. of Appl. Phys., Faculty of Engng., Univ. of Tokyo, Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L136-8 (March 1983).
Liquid phase epitaxy of $Ga_xIn_{1-x}P$ on (100)-oriented GaAs and $GaAs_{0.8}P_{0.2}$ substrates has been studied. Results indicate that the solidus compositions of $Ga_xIn_{1-x}P$ on both substrates tend to be 'locked' near the lattice matching composition. This 'composition pulling' effect is shown to be consistent with a model that takes account of the contribution of lattice mismatch strain energy.

67385 The influence of an external electric field on the silicon homoepitaxy process. Yu.D.Cistjakov, Yu.P.Raynova (Moskovskijh Inst. Elektronnoj Tech., Moscow, USSR), H.G.Schneider.
Electron Technol. (Poland), vol.13, no.1-2, p.117-31 (1980).
The authors present results of an investigation of the electrocatalytic effect on the surface of silicon substrate crystals during nucleation of homoepitaxial silicon layers. An attempt is made to analyse the effect of an external electric field on the formation of an epitaxial interlayer between the substrate and epitaxial layer as well as on the redistribution of impurities in this boundary layer and in the solid-gas interface during the silicon tetrachloride-hydrogen CVD process. The results obtained are used to evaluate the probability of the existence of elementary stages, which are typical of the heterogeneous interaction mechanism between $SiCl_4$ and H_2. (17 refs.)

67386 The top silicon layer of SOI formed by oxygen ion implantation. R.F.Pinizzotto, B.L.Vandrager, S.Matteson, H.W.Lam, S.D.S.Malhi (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA), A.H.Hamdi, F.D.McDaniel.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1718-21 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
High dose oxygen ion implantation has been used to form a buried oxide layer in Czochralski grown silicon. Wafers were implanted with 300 keV $O_2{}^+$ to a total dose of 1.32×10^{18} ions cm^{-2}. A 0.5 m thick SiO_2 layer is formed beneath a 0.17 μm thick top Si layer. Epitaxial films were grown on both annealed and unannealed wafers. Samples were subsequently annealed at 1150°C for times from 10 to 240 minutes in either Ar or N_2. The highest quality epitaxial layers were obtained with substrates that were annealed after implantation, but prior to epitaxial growth for 2 hrs at 1150°C followed by 4 hrs at 1150°C after epitaxial growth. RBS channeling shows that the top 300 nm of these films have ⟨110⟩ channel backscattering yields lower than any SOI produced to date. The buried oxide plus epitaxial process is a leading candidate for VLSI applications. (11 refs.)

67387 VLSI materials: a comparison between buried oxide SOI and SOS. A.H.Hamdi, F.D.McDaniel (Dept. of Phys., North Texas State Univ., Denton, TX, USA), R.F.Pinizzotto, S.Matteson, H.W.Lam, S.D.S.Malhi.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1722-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
High dose oxygen ion implantation in Si has been used to form a 0.48 μm thick buried oxide layer. The total dose was 2.1×10^{18} O^+/cm^2 implanted at 150 keV/atom. Epitaxial growth was employed to deposit a 0.38 μm thick layer on top of the implanted wafers. High quality single crystal Si on the entire 76 mm diameter wafer was achieved. The microstructure of the buried oxide SOI is compared to SOS material. (18 refs.)

67388 Condensed layers of molybdenum and tungsten silicides. V.B.Blokha, N.T.Gladkikh, P.I.Glushko, V.I.Zmii, G.N.Kartmazov, N.S.Poltavtsev (Kharkov Physicotech. Inst., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.5, p.677-80 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.805-8 (May 1982). [received: Feb. 1983]
By condensation under high vacuum, a set of phases has been obtained, corresponding strictly to the phase diagrams of the molybdenum-silicon and tungsten-silicon systems. The condensed silicide films have broader regions of homogeneity in comparison with those observed for different layers, and their formation begins at a substantially lower temperature (770K). In thin condensed layers (below 100 Å) in the tungsten-silicon system, a new FCC phase has been detected. The use of a poorer vacuum, 1.33×10^{-5} Pa, leads to the formation of the Novotnyi phase $Mo_{5-x}Si_{3-y}C_{x+y}$. New data have been obtained on the interplanar distances of the Mo_3Si and Mo_5Si_3 phases. (10 refs.)

67389 Epitaxial growth of tungsten and tungsten-rhenium alloys from the gas phase. Yu.V.Lakhotkin, A.I.Krasovskii (Inst. of Phys. Chem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.5, p.686-9 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.816-19 (May 1982). [received: Feb. 1983]

The growth forms of the nucleation centers of tungsten and a solid solution of rhenium in tungsten on the (100), (111), and (110) tungsten planes correspond in the equilibrium growth figure of BCC metals, namely a rhombodecahedron. The growth form of the nucleation centers in the deposition of the W+6 mass % Re alloy has more pronounced faceting and is more stable with growth in size of the nucleation center than in the case of the deposition of tungsten. Alloying of tungsten with rhenium in the solubility region by this method increases the rate of growth of individual nucleation centers, their density, and the thickness of the layer in which the epitaxial film forms. The growth rate of the epitaxial film depends on the orientation of the base. The greatest growth rate of tungsten and the alloy studied was found on the (100) plane, and the lowest rate was found on the (110) plane. The density of the nucleation centers on tungsten and the alloy studied on the (100) plane was three orders of magnitude greater than that for the nucleation centers on the (110) plane. (8 refs.)

67390 Composition, structure, and properties of pyrolytic iron oxide films. S.S.Olevskii, A.L.Tolstikhina, K.S.Gasonov, A.V.Koshchienko, M.S.Sergeev, B.I.Kozyrkin, B.G.Gribov.

Inorg. Mater. (USA), vol.18, no.5, p.706-10 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.841-6 (May 1982). [received: Feb. 1983]

The pyrolysis temperature and the oxygen concentration in the gas phase are the principal factors that determine the structure of iron oxide films formed on a given support. It was established that the width of the transition region and the effect of relative enrichment of the transition region with iron depend on the pyrolysis temperature and the oxygen concentration in the composition of the gaseous reaction mixture. The structure of the short-range order of amorphous iron oxide films contains the elements of two polymorphous modifications, namely α- and γ-Fe_2O_3, and that it can be interpreted as the geometrical configuration of trigonal bipyramids with D_3 symmetry. (15 refs.)

67391 Nonuniformity in the deformation and substructure of epitaxial layers of $Mg_xMn_{1-x}Fe_2O_4$/MgO. O.G.Alaverdova, L.P.Koval, I.F.Mikhailov, M.Ya.Fuks, L.A.Mitlina, V.V.Molchanov (V.I. Lenin Khar'kov Polytech. Inst., Kharkov, Ukrainian SSR).

Inorg. Mater. (USA), vol.18, no.6, p.858-62 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1020-4 (June 1982). [received: Feb. 1983]

It is shown that the substructure and nonuniformity of the residual deformation of epitaxial layers of $Mg_xMn_{1-x}Fe_2O_4$ create developed relief of the surface of the MgO substrate and compensate for the misfit stresses on vertical phase boundaries. The composition of the solid solution $Mg_xMn_{1-x}Fe_2O_4$ is uniform. (2 refs.)

67392 Study of structural inhomogeneities in epitaxial layers of gallium arsenide. N.A.Klebanova, M.M.Melamed, S.V.Nosikov, I.N.Sorokin, G.N.Terent'eva.

Inorg. Mater. (USA), vol.18, no.7, p.925-7 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1093-5 (July 1982). [received: Feb. 1983]

As a result of a complex investigation of structural defects of epitaxial layers of gallium arsenide, the authors have established that defects of non-dislocational origin may be the determining reason for local changes in the electrophysical properties of the material and the semiconductor structures: growth defects (pits) are centers for local carrier multiplication in an electric field, and their density may reach 5×10^6 cm^{-2}. Impurity deposits serve as sources of enhanced carrier recombination, and their density varies between 10^3-5×10^6 cm^{-2}. The authors examined the characteristics of etching gallium arsenide in an etchant based on chromic anhydride. They established that the etchant affects the distribution of particles of the second phase in the structure of gallium arsenide, in the form of a pattern of characteristic dome-shaped nodules. Furthermore, the etchant provides an overall picture of the inhomogeneities distributed with respect to depth of the expitaxial layer. (7 refs.)

67393 Structure and photoelectric properties of films of solid solutions of the system $Na(K)SbS_2$-Sb_2S_3. V.A.Bazakutsa, V.B.Lazarev, N.I.Gnidash, L.P.Zozylya, A.V.Salov (V.I. Lenin Khar'kov Polytech. Inst., Kharkov, Ukrainian SSR).

Inorg. Mater. (USA), vol.18, no.7, p.928-30 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1096-9 (July 1982). [received: Feb. 1983]

On the basis of analysis of the experimental results, the authors have discovered that, by changing the chemical composition of alloys of the system $Na(K)SbS_2$-Sb_2S_3 and the preparation conditions, one may predetermine the degree of structural disorder in the films obtained and the parameters characterizing their physical properties. (9 refs.)

67394 Short-range order in amorphous thin films of indium selenides. V.P.Zakharov, Yu.G.Poltavtsev, G.P.Sheremet.

Inorg. Mater. (USA), vol.18, no.7, p.931-3 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1100-3 (July 1982). [received: Feb. 1983]

For amorphous films of $In_{1-x}Se_x$ with x=0.333, 0.43, 0.538, and 0.60, mainly tetrahedral coordination of nearest neighbors to the indium atoms is characteristic, while the coordination of the selenium atoms is diverse. The amorphous film with x=0.75 has a substantially microheterogeneous short-range order structure which is characterized by the presence of microinclusions of amorphous selenium and indium atoms octahedrally coordinated by selenium atoms. (12 refs.)

67395 Electron microscope study of defects in epitaxial layers of silicon carbide. A.N.Pilyankevich, V.F.Britun, S.I.Vlaskina, O.T.Sergeev (Inst. of Materials Technol., Acad. of Sci., Ukrainian SSR).

Inorg. Mater. (USA), vol.18, no.7, p.959-62 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1136-9 (July 1982). [received: Feb. 1983]

The study of epitaxial SiC layers revealed a number of structural characteristics. Studies on the real structure of thick SiC films appear promising through the use of the transmission electron microscope together with sample preparation by ion bombardment. (10 refs.)

67396 Pore structure of amorphous silicon. V.O.Abramov, Yu.A.Zarif'yants, A.A.Rodina, D.P.Utkin-Edin (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.7, p.1032-3 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1226-7 (July 1982). [received: Feb. 1983]

The porosity of layers of a-Si:H obtained by decomposing monosilane in a high-frequency glow discharge and depositing it on a substrate at 510K have been investigated. Measurements have been made of the adsorption and desorption isotherms of water vapor at 293K by means of a quartz piezoresonance balance. The working frequency of the AT-cut resonator, 0.65 μm thick, with a-Si:H layers deposited on both sides, was 3.388 MHz. The coefficient of roughness of the layers was determined by analyzing the low-temperature adsorption of argon by the method of Brunauer, Emmett, and Teller (1948). (6 refs.)

67397 Structural and compositional characterization of mixed CdS-CdSe films grown by cathodic electrodeposition. A.S.Baranski, W.R.Fawcett, K.Gatner, A.C.McDonald, J.R.MacDonald, M.Selen (Univ. of Guelph, Guelph, Ontario, Canada).

J. Electrochem. Soc. (USA), vol.130, no.3, p.579-83 (March 1983).

Mixed CdS-CdSe films have been electrodeposited cathodically from DMSO solutions containing cadmium chloride, elemental sulfur and elemental selenium. The mixed films were characterized structurally using X-ray diffraction, scanning electron microscopy, and Rutherford backscattering spectrometry. The photoelectrochemical response of the CdS-CdSe material was studied in a photoelectrochemical cell with a sulfide-polysulfide electrolyte. It has been found that the composition and optical bandgap of the CdS-CdSe films can be varied by changing the composition of the deposition solution. However, the films with higher CdSe content are amorphous, and have a higher resistivity than pure CdS. (9 refs.)

67398 Lattice parameter changes in $Al_{0.39}Ga_{0.61}As$ due to O, Ge, Si, and S doping. W.R.Wagner, N.E.Schumaker, J.L.Zilko, P.J.Anthony, V.Swaminathan (Bell Labs., Murray Hill, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.3, p.670-5 (March 1983).

The change in lattice parameter of epitaxial films of $Al_{0.39}Ga_{0.61}As$ was investigated as a function of growth solution doping. With the lattice constant of GaAs as the reference constant, it was found that the presence of either O_2 in the growth ambient or Ge in the growth solutions dilated the lattice. Growth solution doping with Si was found to initially dilate the lattice while further Si doping resulted in a lattice contraction. Sulfur doping contracted the lattice. It was found that the lattice dilation due to to O_2 in the growth ambient principally resulted from a reduction in the background S contamination of the epitaxial films. (30 refs.)

67399 Deposition of GaAs epitaxial layers by organometallic CVD. Temperature and orientation dependence. D.H.Reep, S.K.Ghandhi (Dept. of Electrical, Computer & Systems Engng., Rensselaer Polytech. Inst., Troy, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.3, p.675-80 (March 1983).

Epitaxial layers of GaAs have been grown in an atmospheric organometallic CVD system for a wide variety of gas phase reactant partial pressures and over a broad range of temperature (450°-1050°C). The growth rates for (100), (100)+3°→⟨110⟩, (110), (111)Ga, and (111)As substrates are reported as functions of temperature and gas composition. Three distinct temperature dependent regions of growth are identified, corresponding to a mid-temperature mass transport limited range, a low-temperature kinetic controlled regime, and a high-temperature desorption limited region. The growth rate is studied as a function of the growth parameters and substrate orientation, and is related to the decomposition of the two reactants trimethylgallium and arsine. A model for the epitaxial growth of GaAs by the organometallic process is proposed, based on these findings. (25 refs.)

67400 Effects of ion implantation on the thermal growth of Pt and NiPt silicides. T.W.Orent, C.I.Knudson, J.A.Sartell (Honeywell Corporate Technol. Center, Bloomington, MN, USA), S.Lee, T.L.Brewer.

J. Electrochem. Soc. (USA), vol.130, no.3, p.687-91 (March 1983).

The effects of low-dose ion implantation of inert gas ions, prior to thermal annealing on the interactions between Pt and NiPt thin films with various forms of silicon, have been investigated. Specimens were implanted with Kr^{2+} and then annealed along with unimplanted samples in the temperature range 350°-650°C. The extent of silicide formation and the phases formed were determined by Auger electron spectroscopy (AES), X-ray diffraction, and transmission electron microscopy (TEM). The implanted Pt films reacted to form complete layers of Pt_2Si which then continued to react to form highly textured layers of PtSi. However, in the implanted samples, no distinct Pt_2Si layers were observed, and the final PtSi phases were fine grained and polycrystalline. In the case of NiPt films, ion implantation inhibited the formation of the distinct Pt silicide layers found during the early stages of the reaction in unimplanted samples. The differences between implanted and unimplanted NiPt samples became progressively smaller with increasing annealing temperature. The final phase formed in both types of specimens was the ternary silicide, $Ni_xPt_{1-x}Si$. (32 refs.)

67401 Surface mobility of silver and gold on evaporated silver bromide layers. A.Panov, J.Malinowski (Central Lab. of Photographic Processes, Bulgarian Acad. of Sci., Sofia, Bulgaria).

J. Signalaufzeichnungsmater. (Germany), vol.11, no.1, p.5-9 (1983).

The growth of vacuum deposited metal clusters on AgBr layers studied by electron microscopy. The contribution of surface diffusion to the growth process is determined. The independence of the apparent sticking coefficient on the occupied area and the width of the diffusion capture zone around each cluster are discussed. From the electron micrographs it is established that the Ag and Au atoms show substantially greater mobility on AgBr than on NaCl, being largest for Ag. The connection between the Ag mobility and the photographic process is discussed. (14 refs.)

67402 Transmission electron microscopy study of undoped and doped polyacetylene films. M.Rolland (Groupe de Dynamique des Phases Condensees, Univ. des Sci. et Tech. du Languedoc, Montpellier, France), M.J.M.Abadie.

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.626-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Reports experimental results concerning the morphology of nascent polacetylene films. The growing process of the fibrils is pointed out and especially the existence of microfibrils. The intrafibrillar aspect is discussed. Elsewhere the dopants' location and diffusion inside the fibril are shown in the case of liquid phase ($MoCl_5$) and vapour phase (iodine) doping. (10 refs.)

67403 Amorphous to microcrystalline transitions in Si films. E.Bustarret, B.Ranchoux, H.Hamdi, A.Deneuville (Groupe des Transitions de Phases, CNRS, Grenoble, France), S.Haunt, P.Depelsenaire.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.950-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Thin films of amorphous silicon were deposited below 630°C by pure LPCVD. In situ post hydrogenation is shown to induce an additional relaxation of the Si matrix achieving progressive crystallisation of these films. The effect of the hydrogen on the intermediate range order is checked by measuring the hydrogen content and the X-ray diffraction and Raman linewidth. The similarity between amorphous and microcrystalline silicon that have been observed brings a further support to the multiphase description of a-Si:H. The coplanar photoconductivity of the films post-hydrogenated 30 mn at 400°C is equal to that of the best glow discharge films. (13 refs.)

67404 Metal-induced crystallization of hydrogenated amorphous Si films. C.C.Tsai, R.J.Nemanich, M.J.Thompson, B.L.Stafford (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.953-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Metal films of Au, Al and Pd deposited on hydrogenated amorphous Si cause the formation of crystalline Si at temperatures well below its normal crystallization temperature of >650°C. The structural aspects are explored by SEM, TEM, scanning Auger microprobe (SAM), and interference enhanced Raman scattering (IERS). The structural changes are correlated with changes of the current-voltage characteristics of the resulting Schottky barriers. (6 refs.)

67405 Formation of AlSb by laser and capacity discharge annealing. L.Baufay, R.Andrew, A.Pigeolet, L.D.Laude (Univ. de l'Etat, Mons, Belgium).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1027-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The preparation of AlSb thin films by either pulsed laser or capacity discharge annealing of Al/Sb sandwiches is compared in order to shed light upon the nature of the transformation. Using 1000 Å thick multilayer films supported by glass substrates, the authors investigate the energy threshold for complete transformation as a function of pulse duration from 10^{-7} to 10^{-1} s. They then calculate the temperature effect directly induced by the energy pulse to be at least 900K or approximately the melting points of the metals. (9 refs.)

67406 Effects of MBE growth conditions on carbon contamination in GaAs. O.Tejayadi, Y.L.Sun, J.Klem, R.Fischer, M.V.Klein, H.Morkoc (Coordinated Sci. Lab., Univ. of Illinois, Urbana, IL, USA).
Solid State Commun. (USA), vol.46, no.3, p.251-4 (April 1983).
The effects of growth and pre-growth conditions on the background concentration of carbon in high quality undoped GaAs layers grown by molecular beam epitaxy have been studied. Characterization of the layers by low temperature photoluminescence indicates that a growth temperature of 580°C minimizes carbon contamination, and extended pre-growth outgassing of the substrate under an As_4 over-pressure results in increased carbon concentrations. The carbon incorporation was found to be relatively insensitive to outgassing temperature above 615°C. Contrary to expectations, increasing the As/Ga flux ratio during growth resulted in larger carbon luminescence peaks. (9 refs.)

67407 Transparent conductive films of tin oxide-preparation and properties. J.George, K.S.Joseph (Dept. of Phys., Univ. of Cochin, Cochin, India).
Solid State Commun. (USA), vol.46, no.7, p.541-4 (May 1983).
Transparent conducting films ($T=87\%$, $\rho=2\times10^{-2}$ ohm cm) of tin oxide have been prepared by the oxidation in air of reactively evaporated tin disulphide films. It has been found that the time taken for the onset of oxidation at different temperatures can be represented by a simple rate relationship. The variation of resistivity of the films with oxidation temperature and heating rate is explained on the basis of the rate of crystallization of the as prepared amorphous sulphide films and the rate of oxidation. A direct transiton at 4.0±0.1 eV has been detected in agreement with earlier reported values. The films obtained show *n*-type conductivity. The oxide films are homogeneous and have strong adhesion to the substrate. (24 refs.)

67408 Sn overlayers on cleaved InSb(110) surfaces. M.Mattern, H.Luth (II. Phys. Inst., RWTH, Aachen, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.502-8 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Auger electron spectroscopy (AES), electron energy loss spectroscopy (ELS) and low energy electron diffraction (LEED) have been used to characterize Sn overlayers on InSb(110) surfaces prepared by cleavage in UHV. At the interface the Sn forms homogeneous layers rather than islands and diffusion of Sb into the overlayer is observed. The LEED results indicate only short range order of the Sn atoms. According to ELS, the bonding configuration appears to be tetrahedral like in α-Sn for a coverage below 50 monolayers, whereas thick layers of several hundred monolayers show β-Sn character. (13 refs.)

67409 Structure of electrolytic cobalt-nickel alloy deposits. I.G.Zhikhareva, A.I.Zhikharev (Tyumen Industrial Inst., Tyumen, USSR).
Sov. Electrochem. (USA), vol.18, no.7, p.876-8 (July 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.7, p.983-6 (July 1982). [received: March 1983]
The alloying of electrodeposited metals is an efficient method to produce coatings with improved physical and mechanical properties; these properties, in the final analysis, are determined by the number of crystal imperfections (twins, stacking faults, microstresses, mosaic block sizes, dislocation density, etc.) present in the deposits to be examined. The authors studied the probability of stacking fault (SF) formation and the dislocation density of two-phase electrolytic Co-Ni alloys on cobalt base. (5 refs.)

67410 Anisotropic properties and structure of amorphous films of selenium. V.Krisciunas, B.Petretis, R.Rinkunas (Dept. of Phys., Vilnius V. Kapsukas State Univ., Vilnius, USSR).
Thin Solid Films (Switzerland), vol.102, no.2, p.111-16 (15 April 1983).
It is shown experimentally that anisotropic columnar inhomogeneous structures form in evaporated amorphous selenium films. The angle of orientation of the structures corresponds to the angle of incidence of the molecular flow. The diameter and density of inhomogeneities in the amorphous films, evaporated at an acute angle, changed by a factor of 30 with a change in the substrate temperature from 20 to 60°C, as a result of diffusion mass transfer of condensed material on the substrate. (9 refs.)

67411 Structure of indium tin oxide electrodes on zirconia. M.Privman, J.Berger, D.S.Tannhauser (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Thin Solid Films (Switzerland), vol.102, no.2, p.117-22 (15 April 1983).
A necessary condition for the preparation of smooth indium tin oxide (ITO) layers prepared by chemical vapour deposition is that the substrate is smooth. For the thinnest films of ITO on zirconia the layer is smooth, but pores were observed along the boundaries of the substrate grains. For layers thicker than 0.25 μm, small and large grains appear, and the sizes of both grow linearly with the layer thickness. On annealing the films in air the number of large grains increases. The difference between the large grains and the background is not chemical. The layers grown are polycrystalline, but there is a preferred direction. (6 refs.)

67412 Substrate-induced lattice strain in particulate palladium deposits. L.B.Garmon, D.L.Doering (Ames Res. Center, NASA, Moffett Field, CA, USA).
Thin Solid Films (Switzerland), vol.102, no.2, p.141-8 (15 April 1983).
Particulate films of palladium were vapor deposited onto single-crystal surfaces of MgO and ultrahigh-vacuum-cleaved mica. For small particles (average diameters less than 10 nm), an increase in the palladium lattice parameter was observed by selected area transmission electron diffraction. Palladium films on MgO grew epitaxially with a lattice expansion that was nearly uniform with particle size although a possible sawtooth variation in the strain with particle size is also discussed. The amount of change in the palladium lattice parameter for films grown on ultrahigh-vacuum-cleaved mica increased with diminishing particle size. The substrate temperature during deposition affected the epitaxy and structure of the particles and thus also changed the degree of lattice distortion. (16 refs.)

67413 Diffusion of arsenic and phosphorus in laser-processed-polycrystalline-silicon-thin-films. H.Baumgart, H.J.Leamy, L.E.Trimble, C.J.Doherty, G.K.Celler (Bell Labs., Murray Hill, NJ, USA).
Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.311-16
Grain boundary diffusion of arsenic and phosphorus in laser processed polycrystalline Si films has been investigated. Mesa diodes were fabricated in LPCVD Si thin films on SiO_2 and subsequently recrystallized by cw Ar ion laser processing to form large grain material. The diffusion length of enhanced As and P diffusion along grain boundaries intersecting the p-n junction has been measured by the EBIC technique. Quantitative experimentation allowed determination of the grain boundary diffusion coefficients of As and P in the temperature range from 900°C to 1250°C. (12 refs.)

71.00 ELECTRON STATES

(see also 63. Lattice dynamics, 73. Surfaces, interfaces, and thin films)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

67414 Ergodicity and density of states in a 1D crystal. J.V.Jose (Phys. Dept., Northeastern Univ., Boston, MA, USA).
J. Phys. A (GB), vol.16, no.7, p.L205-8 (11 May 1983).
Using a decimation technique, the band structure in a 1D periodic solid is shown to be related to the ergodic Ulam-Von Neumann map, $C_{r+1}=1-2C_r^2$. (11 refs.)

67415 On inverting the metric matrices of crystals using the Fourier series method. O.Aikala (Dept. of Phys. Sci., Univ. of Turku, Turku, Finland).
J. Phys. C (GB), vol.16, no.12, p.2217-23 (30 April 1983).
The Fourier series method for calculating the inverse of the metric matrix of crystals (needed in the orthogonalisation of one-electron orbitals) is presented for the general case. In this method the matrix is first partially diagonalised by a unitary transformation (the Fourier series). After inverting the small diagonal blocks, the inverse transformation (summation/integration in the Brillouin zone) is performed to obtain the elements of the inverse metric matrix. Crystals with full orthorhombic, hexagonal or cubic site symmetries are considered in detail. Numerical applications to NaF, LiF and MgO crystals with NaCl structure have been performed and the results are compared with those obtained by the cluster method. For ionic crystals the present procedure is better than the cluster one as regards the accuracy and stability of the results even though the computing times become larger in some cases. The computing procedure in this form is found to be unsuitable for metals and several improvements are found necessary. (22 refs.)

67416 Exact solution of the Anderson model: I. P.B.Wiegmann, A.M.Tsvelick (Landau Inst. for Theoretical Phys., Moscow, USSR).
J. Phys. C (GB), vol.16, no.12, p.2281-319 (30 April 1983).
The complete solution of the non-degenerate Anderson model describing the formation of the localised moment in a metal is constructed on the basis of the Bethe ansatz method. Explicit expressions for the magnetic susceptibility and specific heat are derived at zero temperature but with arbitrary parameters U, Γ and ϵ_d. In the symmetric case the dependence of the impurity magnetisation on the magnetic field is obtained at zero temperature. The asymmetric Anderson model is studied in detail. Explicit expressions for the dependence of the susceptibility and occupation number on the effective resonance level position are derived. (48 refs.)

67417 Exact solution of the Anderson model. II. Thermodynamic properties at finite temperatures. A.M.Tsvelick, P.B.Wiegmann (Landau Inst. for Theoretical Phys., Moscow, USSR).
J. Phys. C (GB), vol.16, no.12, p.2321-36 (30 April 1983).
For pt.I see ibid., vol.16, p.2281 (1983). On the basis of the exact solution which was considered in the previous paper the thermodynamic properties of the Anderson model are studied. (14 refs.)

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

67418 Generalization of the Green's-functions formalism to nonorthogonal orbitals: application to amorphous SiO_2. D.Lohez, M.Lannoo (Lab. de Phys. des Solides, Inst. Superieur d'Electronique du Nord, Lille, France).
Phys. Rev. B (USA), vol.27, no.8, p.5007-11 (15 April 1983).
It is shown that the Green's-function formalism can be extended to nonorthogonal wave functions. This new technique is illustrated on the example of amorphous SiO_2 where the calculated partial densities of states are compared to experimental data. (22 refs.)

67419 Multiple scattering theory of the density of states in semiconductors. A.H.Kahn, J.R.Lowney (US NBS, Washington, DC, USA).
Solid State Commun. (USA), vol.46, no.3, p.229-33 (April 1983).
A method for calculating the electronic density of states of a semiconductor in the presence of impurity scattering is given. The approach is based on a low density multiple scattering expansion. The calculation treats the density of states of the conduction band, shifts of the band edge, and the profiles of the impurity bands. It is performed for a simple model, using a spherical well potential for the individual impurity centers, but could be extended to any scattering potential. The first impurity band forms when the potential is sufficiently strong that one center can bind an electron. The impurity bands are of finite width, have a flat upper edge, and an asymmetrically broadened tail on the low energy side. (18 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

67420 Electronic structures of higher stage graphite intercalation compounds. T.Ohno, H.Kamimura (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.611-13 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Self-consistent non-empirical calculations of the band structures of higher stage graphite intercalation compounds up to the 6th stage were performed using the local density functional formalism. The charge distribution along the c-axis is extremely inhomogeneous, and the orbital contribution to the magnetic susceptibility, which is paramagnetic, reaches a maximum at about stage 6 in the case of $f=1.0$. Finally, the stage dependence of the total energy was determined. (11 refs.)

67421 Band structure properties of one-dimensional donor-acceptor model polymers. M.C.Bohm (Inst. fur Organische Chem., Univ. Heidelberg, Heidelberg, Germany), H.Vogler.
Solid State Commun. (USA), vol.46, no.2, p.201-4 (April 1983).
The band structure of one-dimensional donor-acceptor (DA) stacks have been studied by means of the crystal orbital formalism based on a semi-empirical INDO approximation. The model polymers are composed of quinhydrone moieties (**1** and **2**) with different mutual orientations of D and A. The DA capability was modified by varying the DA distance within the unit cell as well as the effective electronegativity of the active groups of D and A. An insulator-to-metal transition is predicted for **1** at short DA distance and larger differences in the electronegativities of D and A. An avoided crossing between the highest filled and the lowest unfilled $\epsilon(k)$ curves is encountered in **2** leading to a finite band gap for all studied DA interaction conditions. (10 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

67422 Cohesive energy in strongly correlated electronic systems in the non-degenerate band approximation. M.Acquarone (Istituto di Fisica, Univ. di Parma, Parma, Italy), D.K.Ray, J.Spalek.
J. Phys. C (GB), vol.16, no.12, p.2225-36 (30 April 1983).
The electronic contribution to the cohesive energy is calculated in narrow band systems where the splitting of bands due to intra-atomic correlation is larger than the band width by solving the effective Hamiltonian for the lower Hubbard subband in the non-degenerate band approximation on the basis of different decouplings of the quasielectron Green function. Using a rectangular form of the density of states for non-interacting electrons analytical expressions for the ground state energies for different magnetic phases are obtained. The importance of the kinetic exchange on the stability of the magnetic phases is indicated for different fillings of the band. The significance of these results for the understanding of the cohesive energies of strongly correlated systems is discussed. (16 refs.)

67423 Universal tight-binding parameters for cubic IV-VI compounds. P.Enders (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K15-18 (1 March 1983).
The universal parameterization of the resonance integrals in the form $H_{ll'm}=\eta_{ll'm}/d^2$, where $\eta_{ll'm}$ and d are universal constants and the nearest-neighbour (NN) distance, respectively, is very useful for a qualitative or semi-quantitative description of many solid-state properties. The authors derive the universal parameter form for p-p-σ resonance integral $H_{pp\sigma}$ for cubic $A^{IV}B^{VI}$ compounds, i.e. GeTe, SnTe, PbTe, PbSe, and PbS, from a consideration of the electronic polarization in these crystals. (11 refs.)

67424 Dependence of tight-binding interactions on coordination and bond length. J.Robertson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Philos. Mag. B (GB), vol.47, no.4, p.L33-7 (April 1983).
Exceptions to some of the simple rules of tight-binding interaction behaviour are enumerated. A strong polarization dependence of π interactions in graphite is found. The d^{-2} scaling hypothesis is found to fail when s and p orbitals are unequally involved, as in group-V elements or in changes under pressure. (13 refs.)

67425 Algorithms for evaluation of cross sections of isoenergetic surfaces in a pseudopotential approach. Yu.A.Pospelov, S.G.Novikov (S. Ordzhonikidze Moscow Inst. of Control, Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.726-9 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.53-60 (Aug. 1982). [received: April 1983]
Original methods are proposed for a direct approach to the calculation (with extended precision) of flat cross sections of isoenergetic surfaces $E_n(k)=E_0$ for the electrons of a solid, belonging to the n-th energy band. Two different methods to determine points of the contour L(E) of a cross section are considered. They are based on an iterative technique; the points of the contour of a section obtained during the computation are used to determine new points. (4 refs.)

67426 Computation of differential characteristics of cross sections of isoenergetic surfaces and determination of extremal cross sections in a pseudopotential approach. Yu.A.Pospelov, V.I.Mel'nikov, S.G.Novikov (S. Ordzhonikidze Moscow Inst. of Control, Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.729-32 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.56-60 (Aug. 1982). [received: April 1983]
Without using numerical differentiation methods, expressions for computation of differential characteristics of first and second order of flat cross sections of isoenergetic surfaces $S(E,\mathbf{k})$ are obtained (where E is the energy, and **k** is the wave vector). (4 refs.)

67427 Anisotropy of electron impurity scattering in dilute Al(Li). W.Joss, W.van der Mark, R.Monnier (Lab. fur Festkorperphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland), L.Cole, W.E.Lawrence.
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.736-54 (1982).
The variation of the conduction electron scattering rate over the third-zone electron sheet of the Fermi surface of aluminum, due to small concentrations of lithium impurities, has been determined from de Haas-van Alphen effect studies. Theoretical results for the Dingle temperatures for orbits on the second-zone hole and third-zone electron sheet of the Fermi surface are reported. Several improvements to the previous theoretical treatment are discussed; these include nonlocal exchanger and correlation in the impurity-induced potential, the effects of lattice relaxation around the impurity, and lattice backscattering. For the last point, the authors exploit the connection between the pseudoplane-wave and KKR-Green's function formalisms. Despite these various improvements, the agreement between experiment and theory is not improved substantially. Possible physical reasons for this are discussed. (30 refs.)

67428 Electron-hole recombination effect on the quantum oscillations of sound velocity for $q \wedge H \sim 90°$ in dilute $Bi_{1-x}Sb_x$ alloys. M.Akinaga (Dept. of Phys., Fukuoka Univ. of Education, Fukuoka, Japan), T.Inoue, S.Mase.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1324-32 (April 1983).
The quantum oscillations of sound velocity in dilute $Bi_{1-x}Sb_x$ alloys with $x=0$, 1.0×10^{-4} and 3.6×10^{-4} have been investigated under the condition that the magnetic field vector H has been applied perpendicularly or nearly perpendicularly to the sound wave vector q. The oscillation-amplitudes in the alloys have been found to be greatly enhanced compared with those in pure bismuth. These are analyzed on the basis of a theory which takes account of the contributions from the limiting point carriers, from the carriers on the nonextremal orbits and the electron-hole recombination process due to the carriers on the extremal orbits. It is shown that the remarkable enhancement in amplitudes is mainly caused by a coupling of two affairs, i.e. one order shorter electron-hole recombination time in the alloys than that in pure bismuth and the contribution from the limiting point carriers as in the case of the attenuation coefficient.

67429 Shubnikov-de Haas oscillations in transition-metal pentatelluride. M.Izumi, S.Harada (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), R.Yoshizaki, K.Uchinokura, E.Matsuura.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.605-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Shubnikov-de Haas oscillations have been studied in group IVB-transition-metal pentachalcogenides, $ZrTe_5$ and $HfTe_5$. In $ZrTe_5$ a single cross section of the Fermi surface with a frequency of 0.049 MG (B//b-axis) dominates the oscillatory behaviour. In $HfTe_5$ the authors obtained the frequency of 0.015 MG from DC magnetoresistance measurements. The AC magnetoresistance suggests that another cross sectional frequency is superposed on the original frequency of 0.015 MG. Observed frequencies of 0.049 MG and 0.015 MG correspond to 0.06% and 0.02% of areas of each Brillouin zone perpendicular to the b-axis. Although the origin of such low frequency oscillations has not been made clear, observed low frequencies in both compounds may be strongly related to the existence of CDWs or other anomalous properties of these compounds. (11 refs.)

67430 Electronic structure of palladium. A.K.Bordoloi, S.Auluck (Phys. Dept., Univ. of Roorkee, Roorkee, India).
Phys. Rev. B (USA), vol.27, no.8, p.5116-18 (15 April 1983).
An attempt is made to obtain a good fit to the Fermi-surface data of Pd by using the interpolation scheme. The starting point was the parameters of the scheme that had been fitted to the photoemission data. Making minimal changes in the parameters, the authors obtain a good fit to the Fermi surface, and at the same time good agreement with the optical data is achieved. (18 refs.)

67431 Investigation of bandmasses and G-values by two-photon-magneto-absorption (TPMA) in ZnSe. H.W.Holscher, A.Nothe (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany), Ch.Uihlein.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.395-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors present the first TPMA-measurements (up to 9T) on the 24 fold degenerate 2p-exciton in ZnSe. The measurements were carried out in Faraday- ($\vec{k}\parallel\vec{B}$) and Voigt-configuration ($\vec{k}\perp\vec{B}$). By various combinations of polarization states of the two fundamental beams (σ_+, σ_-; σ, π) one can selectively excite excitons with total angular momentum $M_{tot}=0$, ±1 and ±2. From the large splitting due to the envelope g-value and from the strong diamagnetic shift one can deduce a reliable set of conduction (m_e^*, g_c) and valence band parameters (γ_1, γ_2, γ_3, κ). The detailed calculation of these parameters is based on the theory of Lipari et al. (1973) using irreducible tensor operators. (11 refs.)

67432 Electronic properties of sulfur containing conjugated polymers. J.L.Bredas (Lab. de Chimie Theorique Appl. Facultes Univ. Notre-Dame de la Paix, Namur, Belgium), R.L.Elsenbaumer, R.R.Chance, R.Silbey.
J. Chem. Phys. (USA), vol.78, no.9, p.5656-62 (1 May 1983).
Valence effect Hamiltonian (VEH) calculations are performed on a number of sulfur containing organic conjugate polymers of interest to the conducting polymers area. Theoretical results for parameters related to conductivity such as ionization potentials, bandwidths, and bandgaps are presented. Systems considered include various derivatives of poly (*p*-phenylene sulfide), polybenzodthiophene, and polythiophene, as well as potentially interesting compounds such as polythieno [3,2,-*b*] thiophene and polyvinylene sulfide. The electronic structure description afforded by the VEH method for sulfur containing polymers is demonstrated to be of the same quality as that presented previously for hydrocarbon polymers. In particular, for ionization potentials, good agreement with available experimental data on poly (*p*-phenylene sulfide) and polybenzothiophene is obtained, after scaling downward the VEH values by a 1.9 eV polarization correction. The comparison between the theoretical and experimental XPS spectra for polybenzothiophene is excellent with use of the

same energy scaling factor previously employed for polyacetylene, poly(p-phenylene), and poly(p-phenylene sulfide). These results, in conjunction with previous results obtained on hydrocarbon polymers, lend confidence in the predictive capabilities of this purely theoretical technique. Calculations show that polyvinylene sulfide, as yet unsynthesized, should display very promising characteristics as a conducting polymer. (40 refs.)

67433 Valence band structure of hydrogenated amorphous silicon-carbon alloys studied by photoelectron spectroscopy. Y.Katayama, T.Shimada, K.L.I.Kobayashi (Central Res. Lab., Hitachi Ltd., Tokyo, Japan), C.Jiang, H.Daimon, Y.Murata.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.947-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The electronic structure of hydrogenated amorphous silicon-carbon alloys a-Si(x)C(1−x):H in the valence band region is studied systematically by in situ photoelectron spectroscopy using synchrotron radiation with photon energies hνs 30-130 eV. The assignment of the characteristic features in photoelectron spectra is made by using the hν- and x-dependences of the observed photoelectron spectra and the variation of the spectra due to heat treatments. In addition to the systematic variation of valence band structure depending on x, it is revealed that only a small amount of carbon atoms in Si-Si network modify some parts of the valence band greatly and also affect the Si-H bonding. 67434 Charge densities in FCC transition metals. N.A.Johnston, C.A.Sholl (Dept. of Phys., Univ. of New England, Armidale, NSW, Australia).
J. Phys. F (GB), vol.13, no.5, p.945-52 (May 1983).
A simple and accurate means of reproducing the band structure of an FCC transition metal is by means of a model Hamiltonian which depends on a set of parameters determined from known energy eigenvalues at symmetry points in the Brillouin zone. It is shown that the model Hamiltonian can also reproduce the metal charge density with good accuracy if care is taken with the choice of atomic orbitals to be used in the calculations. Calculations are performed for Ni, Cu, Rh, Pd and Ag and the spherically averaged charge densities obtained from the model Hamiltonian are compared with those of Moruzzi et al. (1978). Agreement to better than 10% is obtained in all cases out to the muffin-tin radius. (8 refs.)

67435 Possibility of a spectral determination of the gap in the energy spectrum of alkali metals. I.I.Geguzin (Sci.-Res. Inst. of Phys., State Univ., Rostov-on-Don, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1627-8 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2868-70 (Sept. 1982). [received: April 1983]
The author shows that the contribution to the spectrum from transitions from the second band to the first band in alkali metals contains a divergence of the form $(\omega-\omega_g)^{-1/2}$, where ω_g is the energy gap between these bands on the surface of the Brillouin zone. (9 refs.)

67436 Magnetophonon oscillation in the conduction band and phonon-drag-enhanced magnetophonon peak of thermoelectric power of tellurium. K.Takita, K.O-hata, K.Masuda (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.244-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
At about 200K where the Hall coefficient of p-Te reverses its sign, magnetophonon oscillation of longitudinal magneto-Seebeck coefficient $(\partial^2\alpha_{//}/\partial B^2)$ is observed in $B//c$ and $B_{\perp}c$ by the use of the second derivative method. It is interpreted as a contribution of electron in the conduction band of Te. Effective mass values of the conduction band at 200K are deduced on an interpretation; $m^*_{\perp}=0.160\ m_0$ and $m^*_{//}=0.072\ m_0$. Below 20K on the other hand, a large peak is found at 3.2T in $-\delta^2\alpha_{//}/\delta B^2$ under $B//c$. The peak height is rapidly increasing with decreasing temperature by the phonon drag effect. The peak is interpreted as a resonant scattering peak by longitudinal acoustic (LA) phonon between the two valleys split off by 'inversion asymmetry splitting $\mu_B GB$', which gives $G=5.5$ in good agreement with $G=5\pm1$ determined by Shubnikov-de Haas experiment. (10 refs.)

67437 Anisotropic state filling in semiconductors. A.L.Smirl, T.F.Boggess, G.P.Perryman, A.Miller, B.S.Wherrett (Center for Appl. Quantum Electronics, North Texas State Univ., Denton, TX, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.389-91 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Picosecond self-diffraction measurements in germanium indicate that, for excitation levels in excess of 1 GW/cm², the authors observe the effects of anisotropic state-filling. A new theoretical model is outlined and agreement is found with all aspects of the data. (no refs.)

67438 Nonrelative dispersion relation in crystals with a diamond structure. A.A.Lipnik, K.Ya.Shtivel'man (Ternopol Pedagogic Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.579-82 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.3-6 (July 1982). [received: May 1983]
The dispersion equations introduced in a previous paper (1982) are solved and the analytical expression of the dispersion relations thus obtained are investigated. The latter is in fair agreement with experiment for the heavy and light hole bands in the ⟨100⟩, ⟨110⟩ directions and for electrons of the lower conduction band in the ⟨100⟩ directions. An iteration procedure is proposed for the solution of the dispersion equations in arbitrary directions of the wave vector up to the Brillouin zone boundary. (18 refs.)

67439 Dispersion equation for crystals with diamond structure with spin-orbital interaction taken into account. A.A.Lipnik, K.Ya.Shtivel'man (Ternopol Pedagogic Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.582-5 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.6-9 (July 1982). [received: May 1983]
Analytical expansion of the secular twenty-second order determinant is performed, in which the spin-orbital interaction between the upper valence zones is taken exactly into account in addition to the kp-interactions examined in previous papers (1982). A compact algebraic relativistic dispersion equation of eleventh degree is obtained which is suitable in the whole Brillouin zone. It is factorized on the axes of symmetry. In addition, the spin-orbital interaction between the conduction zones Γ_{15C} is taken into account on the axes ⟨100⟩. An iteration procedure is elucidated to solve the dispersion equation. 67440 X-ray spectral study of iron phosphides. V.V.Nemoshkalenko, L.S.Voskrekasenko, V.V.Didyk, V.P.Krivitskii, L.I.Nikolaev, L.Ya.Solamatina, V.B.Chernogorenko (Inst. of Metal Phys., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.809-12 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.964-8 (June 1982). [received: Feb. 1983]
The occupied part of the valence band of iron phosphides consists of two partially overlapping subbands. The degree of overlap of these subzones decreases on transition from higher to lower phosphides. The low-energy subband is formed mainly by the 3s-states of phosphorous, with an admixture of states with p-symmetry with respect to iron atoms. The high-energy subband consists of a group of hybridised states of the crystal, with complex hybridisation. In this, subband states appear, which leads to Fe-Fe, Fe-P, and P-P bonds. In the crystal lattice of the phosphides, two types of Fe-P interaction take place: a weak one occurring in states with p-symmetry with respect of the iron atoms, and s-, p-symmetry with respect to phosphorus atoms, and a more vigorous interaction, occurring in states of all the principal types of symmetry with respect to iron and phosphorous atoms. (4 refs.)

67441 Electrophysical properties of transition metal oxides. I.G.Tkachenko, E.K.Fen.
Inorg. Mater. (USA), vol.18, no.6, p.822-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.979-82 (June 1982). [received: Feb. 1983]
The electric properties of oxides of d-transition metals were investigated and the mechanisms of their change with the number of electrons in the d-shell of an isolated metal atom were clarified. (21 refs.)

67442 Valence-band parameters and hole mobility of Ge-Si alloys—theory. K.Takeda, A.Taguchi, M.Sakata (Dept. of Instrumentation Engng., Keio Univ., Yokohama, Japan).
J. Phys. C (GB), vol.16, no.12, p.2237-49 (30 April 1983).
Using the Lawaetz method the authors have estimated the **k.p** band parameters and determined the band structure near the valence-band edge of the Ge-Si alloy system. They have also obtained the coupling constants between holes and phonons by Wiley's method. Using these two kinds of parameters they have calculated the time for relaxation of holes due to the lattice scattering, where they have taken into account the nonpolar optical phonon, the impurity scattering due to ionised and neutral centres and also the alloy scattering. The intervalence-band interactions are shown to produce the complicated temperature dependence of the hole mobility. (45 refs.)

67443 Energy gap dependance of the acceptor ionization energy induced by hydrostatic pressure at low temperature, near the SM-SC transition on $Hg_{1-x}Cd_xTe$. M.M.G.de Carvalho, C.Fau, M.Averous (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.431-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors show that the acceptor energy ionization on $Hg_{1-x}Cd_xTe$ near the semimetal semiconductor transition varies differently under pressure (i.e. with the energy gap). Two behaviours are shown when $E_A\simeq5$ meV, E_A varies smoothly with P. For $E_A\simeq10$ meV, it varies very quickly with P. (11 refs.)

67444 Spin interaction enhanced anisotropy of the band overlap in $Hg_{.97}Mn_{.03}Te$. A.M.Sandauer, W.Dobrowolski, J.Kossut, R.R.Galazka (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.455-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The Hall effect and the conductivity of n-type $Hg_{1-x}Mn_xTe$ $(x=0.03)$ single crystals were studied at 2 and 4.2K in magnetic fields up to 6T. The Hall voltage is found to depend sensitively on the orientation of the magnetic field with respect to the crystallographic axes (B∥⟨100⟩ and B∥⟨110⟩). This fact is

interpreted in terms of the warping asymmetry which is enhanced by the exchange induced overlap of the conduction and the valence bands. Thus, magnitude of observed anisotropy of the Hall constant depends on the temperature. (8 refs.)

67445 Influence of exchange interaction on band structure of $Pb_{1-x}Mn_xTe$. J.Niewodniczanska-Zawadzka, G.Elsinger, L.Palmetshofer, A.Lopez-Otero (Inst. fur Phys., Univ. Linz, Linz, Austria), E.J.Fantner, G.Bauer, W.Zawadzki.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.458-60 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Magneto-optical and magneto-transport experiments have been performed on $Pb_{1-x}Mn_xTe$ crystals with $0<x<0.028$ grown by hot wall technique. The effective mass increase with Mn content has been established. A combined cyclotron-spin resonance has been observed, indicating semi-magnetic properties of PbMnTe. (12 refs.)

67446 Anomalous composition and temperature dependence of the energy gap of $AgGa_{1-x}In_xSe_2$ mixed crystals. Suk-Ryong Hahn, Wha-Tek Kim (Dept. of Phys., Chonnam Nat. Univ., Gwangju, Korea).
Phys. Rev. B (USA), vol.27, no.8, p.5129-31 (15 April 1983).
Lattice constants *a* and *c* were measured in the mixed crystals $AgGa_{1-x}In_xSe_2$ for $0 \leq x \leq 1$. They showed a miscibility region from $x=0.0$ to $x=0.4$ and from $x=0.8$ to 1.0, and then immiscibility near $x=0.6$ in the composition dependence of the lattice constants *a* and *c*. Also, the photoconductivity peak energy and the energy gap measured in the composition range from $x=0.0$ to 1.0 showed a discontinuity near $x=0.6$. The temperature coefficient of the photoconductivity peak energy is $(1.4\text{-}2.8)\times 10^{-4}$ eV/K and that of the energy gap $(2.3\text{-}3.8)\times 10^{-4}$ eV/K in the temperature range 25-75K. The sign of the temperature coefficient reverses and the values are $-(2.4\text{-}4.1)\times 10^{-4}$ and $-(2.4\text{-}5.1)\times 10^{-4}$ eV/K, respectively, in the temperature range 100-300K. (14 refs.)

67447 Anion displacements and the band-gap anomaly in ternary ABC_2 chalcopyrite semiconductors. J.E.Jaffe, A.Zunger (Solar Energy Res. Inst., Golden, CO, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5176-9 (15 April 1983).
Using a first-principles all-electron band-structure approach, the authors show that the anomalous (>50%) reduction in the band gaps of the $A^{I}B^{III}C_2^{VI}$ chalcopyrite semiconductors relative to their II-VI isoelectronic analogs results both from a pure structural effect (the anion displacements reflecting the mismatch of classical elemental radii) and from a purely electronic effect (*p-d* repulsion in the valence band), with a small coupling between the two factors. (20 refs.)

67448 A theoretical study of the *x*-dependence of the conduction-band density of states in metallic sodium tungsten bronzes Na_xWO_3. D.W.Bullett (School of Phys., Univ. of Bath, Bath, England).
Solid State Commun. (USA), vol.46, no.7, p.575-7 (May 1983).
Electronic structure calculations are reported for the cubic metallic bronze $NaWO_3$ and for WO_3 in its approximate cubic and real monoclinic structures. Within the composition range of the cubic bronzes Na_xWO_3 ($0.5<x<1$) the trends of rigid band model behaviour are approximately valid, but when little or no sodium is present the monoclinic distortions induce a significant increase in the semiconducting energy gap. (18 refs.)

67449 A study of the band structure of the $Co_{1-x}Cu_xCr_2S_4$ system of magnetic semiconductors by the diffuse reflection method. K.P.Belov, L.I.Koroleva, V.Yu.Pavlov, A.G.Temiryazev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1597-9 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2821-3 (Sept. 1982). [received: April 1983]
The authors present the results of a study of the diffuse-reflection spectra of powdered specimens of the $Co_{1-x}Cu_xCr_2S_4$ spinel system at room temperature, for the purpose of obtaining information on its band structure. The diffuse-reflection coefficient was measured using a single-beam arrangement in which the intensity of the light-reflected from the specimen and from a standard was measured alternately in the spectral range 0.5-2.3 eV. The experimental data were processed using the Kramers-Kronig rules. (4 refs.)

71.30 METAL-INSULATOR TRANSITIONS

67450 Substitution of TMTSeF with TMTTF in $(TMTSeF)_2ClO_4$: high pressure studies. S.S.P.Parkin, C.Coulon, D.Jerome (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), J.M.Fabre, L.Giral.
J. Phys. (France), vol.44, no.5, p.603-7 (May 1983).
$[(TMTSeF)_{1-x}(TMTTF)_x]_2ClO_4$ alloys have been studied under pressure for pressures up to 18 kbar through resistivity measurements. On substitution of TMTSeF in the superconducting compound $(TMTSeF)_2ClO_4$ with TMTTF a low temperature metal-insulator (M-I) transition is found at ambient pressure; above some critical pressure, P_c, the M-I transition is suppressed giving rise to a metallic state to the lowest temperatures considered in this study. The phase diagrams of the various alloys are of the same form although P_c increases with increasing TMTTF concentration. Superconductivity was not observed in any of these materials in the metallic high pressure regime. (27 refs.)

67451 Approaches for reducing the insulator-metal transition pressure in hydrogen. A.E.Carlsson, N.W.Ashcroft (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1305-8 (25 April 1983).
Two possible techniques for reducing the external pressure required to induce the insulator-metal transition in solid hydrogen are described. One uses impurities to lower the energy of the metallic phase relative to that of the insulating phase. The other utilizes a negative pressure induced in the insulating phase by electron-hole pairs, created either with laser irradiation or pulsed synchrotron sources. (27 refs.)

67452 Magnetic field induced nonmetal-metal transition in the open-gap $Hg_{1-x}Mn_xTe$. T.Wojtowicz, A.Mycielski (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.476-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Transverse and longitudinal magnetoresistance of p-type $Hg_{1-x}Mn_xTe$ crystals ($x=0.081$, 0.098, 0.11) were investigated in the temperature range 1.4K-300K and in magnetic fields up to 7 T. In the extrinsic and impurity conduction regime a strong negative magnetoresistance was observed. An experimental evidence for the magnetic field induced nonmetal-metal transition was obtained. The effects are discussed in terms of the theory of an acceptor state modified by the exchange interaction between holes and Mn^{++} ions. A role of the bound magnetic polaron localized on acceptor centre is also considered. (10 refs.)

67453 Charge density anomalies in Si and InSb preceding the high pressure transition. D.R.Yoder-Short, R.Colella, B.A.Weinstein (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.564-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The intensity of the (222) forbidden X-ray reflection in Si and InSb was measured as a function of high hydrostatic pressure. A few kbars prior to the pressure induced transformation to the metallic β-Sn structure the (222) intensity decreases sharply. This anomalous behaviour is interpreted as being due either to smearing of the valence bond-charge in anticipation of the metallic state, or to increased anharmonicity in the thermal vibrations. The role of zone boundary TA phonons is considered. (18 refs.)

67454 Study about the onset of intermediate valency in $TmSe_{0.32}Te_{0.68}$ under pressure. H.Boppart (Lab. fur Festkorperphys., ETH Zurich, Zurich, Switzerland), W.Rehwald, E.Kaldis, P.Wachter.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.573-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
In semiconducting $TmSe_{0.32}Te_{0.68}$ a pressure induced continuous transition to the metallic state takes place around 1.5 GPa. In order to study the variation of the elastic behavior through the transition the authors measured the ultrasonic sound velocities in the [100] and [110] directions as well as the specific volume up to 1.7 GPa. The softening of the longitudinal acoustic phonons and the bulk modulus is mainly caused by the negative elastic constant c_{12}. It appears that an appreciable mixture of 4f and 5d states must be present already in the semiconducting range leading to an 'intermediate valent semiconductor'. (11 refs.)

67455 Separable spectral model of the metal-insulator transition in Si:P. J.C.Phillips (Bell Labs., Murray Hill, NJ, USA).
Philos. Mag. B (GB), vol.47, no.4, p.407-18 (April 1983).
A two-fluid spectral model based on separable localized and extended states predicts that near but above threshold the impurity-band conductivity, σ, of a randomly doped semiconductor is proportional to $(\rho\text{-}\rho_c)^s$ where ρ_c is the critical density and $s(d)=(d-2)/2$ where *d* is the dimensionality. Localization, quantum and scaling theories have predicted $s(3)\sim 1$, $=0$ and $\geq 2/3$, respectively, whereas the present model gives $s(3)={}^1/_2$, in agreement with a hydrodynamic model and with recent experiments which give $s(3)=0.48\pm 0.07$. The theory is extended to predict $s^K(d)$, the conductivity index for compensated samples. The result is $s^K(d)=1({}^1/_2)$ for $d>2$ and *d* odd (even). This again is in good agreement with experiment, which gives $s^K(3)=1.15\pm 0.15$. (33 refs.)

67456 Localization and mobility edge in two-dimensional systems. I.P.Zvyagin (Faculty of Phys., Moscow State Univ., Moscow, USSR).
Philos. Mag. B (GB), vol.47, no.4, p.451-6 (April 1983).
The behaviour of the conductivity of two-dimensional systems, often interpreted using the concept of the mobility edge, is shown to be consistent with the scaling theory of localization. (12 refs.)

67457 X-ray diffuse scattering study of the organic one-dimensional conductor TMTTF-bromanil. S.Kagoshima, J.P.Pouget (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), T.Yasunaga, J.B.Torrance.
Solid State Commun. (USA), vol.46, no.7, p.521-5 (May 1983).
In the title compound, both $2k_F$ and $4k_F$ incommensurate lattice modulations were found by diffuse X-ray scattering. $4k_F$ streaks are observed at room temperature, below which the DC conductivity shows non-metallic behavior, but they do not turn into satellite spots at low temperatures. $2\ k_F$ broad spots develop rapidly below about 80K, the temperature below which the spin susceptibility vanishes and the electrical conductivity decreases more rapidly. It is suggested that the system may have a character intermediate between the Peierls and the spin-Peierls transitions. (30 refs.)

67458 Mott transition in layer semiconductors. Z.D.Kovalyuk, A.I.Seredyuk, K.D.Tovstyuk (Inst. of Problems in Materials Sci., Acad. of Sci., Chernovtsy, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1331-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2061-3 (Nov. 1982). [received: April 1983]
A longitudinal electric field was used to introduce Li and Pb impurity atoms into the interlayer spaces in InSe single crystals and the average distance between these impurities varied with the concentration. The investigation established that only atoms with s-valence electrons can be introduced readily into the interlayer space in InSe, whereas atoms with p and d-valence electrons form bonds with covalent layers and thus prevent penetration of an intercalant into van der Waals traps. The temperature dependence of the Hall coefficient was determined for 'pure' and intercalated crystals in the range 77-300K. Intercalation with lithium did not alter the nature of the temperature dependence of the hall coefficient but the carrier density decreased by one or two orders of magnitude. The subsequent intercalation of lead in concentration below 10^{18} cm^{-3} did not cause any significant changes, but at high intercalant concentrations, the nature of the dependence changed significantly. In this case it was characterized by the presence of three extrema. (4 refs.)

71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

67459 Triplet exciton lifetime under pressure in 'pure anthracene'. S.Arnold, N.Hassan (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5602-11 (1 May 1983).
The triplet exciton lifetime in 'pure' anthracene crystals is found to decrease by as much as a factor of 3 at room temperature under pressures up to 6.4 kbar and in a reversible fashion. Temperature measurement under pressure from 200 to 400K show that the effect is due to a state ~0.3 eV below the exciton band. Experiments with tetracene doped anthracene revealed that trapping by tetracene is increased by a factor of 2 over the same pressure range, indicative of enhanced diffusion. A comparison with the 'pure' anthracene effect reveals that pressure enhanced diffusion is insufficient for explaining this effect; the cross section for capture by the 0.3 eV state must change by more than a factor of 4 in going from 1 atm to 6.4 kbar. A triplet excimer is invoked for explaining the results, consistent with earlier work. The pressure dependence of the mean capture cross section for this species is determined. (15 refs.)

67460 The binding energy of excitons in polar crystals. Gu Shiwei (Dept. of Phys., Neimenggu Univ., Huhehot, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.12, p.1275-7 (Dec. 1982).
There is a great difference, sometimes as great as an order-of-magnitude, between the calculated values of the binding energy of excitons in polar crystals and the experimental ones. The author makes an improved calculation of the binding energy of excitons in TlBr, TlCl, ZnO and CuCl crystals. The results of the new calculation, especially those of ZnO, CuCl, are in better agreement with the experimental ones. (6 refs.)

67461 Excitons in a finite polymer chain. B.S.Tosic, G.S.Davidovic-Ristovski, Lj.M.Ristovski (Inst. of Phys., Novi Sad, Yugoslavia).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K1-4 (1 March 1983).
Frenkel excitons in a finite polymer chain, consisting of weakly interacting molecules, are considered. The continuum approximation is used, i.e. the long-wave excitons are taken into account only. The authors apply this approximation to the pure exciton system. It is shown that it leads to some unexpected results. (2 refs.)

67462 Faraday rotation in the lowest exciton resonance of gallium arsenide. Th.Hornung, R.G.Ulbrich (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.263-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reports Faraday rotation (FR) spectra of the exciton polariton resonance in high purity GaAs. The drastic variation of the group velocity around the lowest exciton n=1 leads to a giant resonance enhancement in the FR spectrum. The experimental data are explained quantitatively in a simple model within the polariton framework. It is possible to measure the product $g_{eff}.E_{LT}$ of the 1s exciton polariton resonance with high precision. In the low field region it is an excellent method to measure g_{eff} if E_{LT} is known. (11 refs.)

67463 Bound and free exciton states in InP. M.S.Skolnick, P.J.Dean (Royal Signals & Radar Establ., Great Malvern, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.266-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Photoluminescence (PL), PL excitation (PLE) and photoconductivity (PC) studies in the near band edge spectral region of InP are reported. Very well resolved donor bound exciton (D^0,X) lines are observed at low excitation intensity. Selective excitation of the (D^0,X) 'two electron' PL satellites is studied. A comparison is made between the relative strength of the different exciton features in PLE and PC. (14 refs.)

67464 Crystal field splitting of excitons bound to neutral complexes in GaP. H.P.Gislason (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden), B.Monemar, P.J.Dean, D.C.Herbert.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.269-71 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The characteristic spin-like singlet-triplet configuration of excitons bound to hole-attractive neutral associates in GaP results from a quenching of the hole orbital angular momentum in a local compressive axial strain field. A smaller crystal-field splitting of the multivalley degenerate electron states of excitons bound to such complexes is proposed to explain the additional BE states observed in several cases. Photoluminescence data on centres involving the hole-attractive substituents Cu_{Ga} and Sb_P serve as examples. (9 refs.)

67465 Instability of self-trapped exciton caused by hydrostatic pressure in AgCl. M.Kobayashi, Y.Ohno, S.Endo, K.Cho, S.Narita (Dept. of Material Phys., Osaka Univ., Osaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.272-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Recombination radiation spectra of self-trapped exciton in AgCl are investigated under hydrostatic pressure at 1.8K. With increasing the pressure the emission peak is found to shift toward the higher photon energy. The emission intensity decreases abruptly in the vicinity of 2.3 GPa and the peak disappears at more than 3.2 GPa. Observed instability of the self-trapped exciton is explained in terms of a configuration coordinate model. (7 refs.)

67466 Exciton dispersion in degenerate bands. M.A.Kanehisa (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.275-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The problem of separation into relative and translational degrees of freedom of the motion of an electron and a hole in a degenerate band, first considered by Dresselhaus (1956), is completely solved. The transformation from electron-hole variables into relative and translational variables is achieved by a linear transformation, which, by mixing valence subbands, eliminate all terms containing simultaneously the relative and the total momenta. The exciton masses are expressed explicitly in terms of the Luttinger band-structure parameters. Quantum-mechanical expression for the center of mass operator is also given. (9 refs.)

67467 Excitons in polar semiconductors. H.Buttner (Lehrstuhl fur Theoretische Phys., Univ. Bayreuth, Bayreuth, Germany), J.Pollmann.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.278-83 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A brief review of the main influences of the exciton-phonon interaction on exciton properties in polar semiconductors is presented. The authors make use of the great flexibility of the variational approach to the involved mathematical problem in order to be able to present a number of applications. The effects discussed range from binding energy shifts and corresponding changes of oscillator strengths, over exciton dispersion and phonon side bands to excitons in a magnetic field and quenching of diamagnetic shifts due to phonon- and anisotropy-influences. Finally, a short outlook is presented by discussing some results in nonlinear exciton-phonon dynamics. (48 refs.)

67468 Excitonic polarons and core excitons: dielectric relaxation and optical transitions. G.Iadonisi (Istituto di Fisica Teorica, Univ. di Napoli, Napoli, Italy), F.G.Bassani.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.284-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors study 'valence excitons' in interaction with longitudinal optical phonons and 'core excitons' in interaction with the valence electron-hole pairs. They use the effective mass approximation and include the interaction with a boson field by Frolich models. They compute the lowest exciton states by solving exactly the functional Eulerian equation for the distribution function of the boson coherent state. The relaxations of the boson field produce a screening of the electron-hole interaction and a polarization energy, which depends only on the ratios of the exciton to the polaron radii. Explicit calculations show cases with total, partial relaxation or without it. Higher energy states with the same electronic part of the wave function are also introduced. Optical transition probabilities to the excitonic states are computed in first order and give a distribution of the oscillator strength which depend on the boson distribution function of the coherent state. (13 refs.)

67469 Polaronic versus bare excitons: a functional-integration approach to the exciton-phonon problem. J.Adamowski (Solid State Phys. Dept., AGH, Krakow, Poland), B.Gerlach, H.Leschke.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.287-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors consider an exciton-LO-phonon system described by Frohlich's Hamiltonian. Making use of functional-integration techniques one can eliminate the phonon terms exactly leading to an effective two-particle system. They study the action functional of this system in limiting cases and establish a new upper bound on the ground-state energy. Furthermore, localization properties of the center of mass of the exciton are discussed. (9 refs.)

67470 The origin of the Urbach tail. A Monte-Carlo study of the exciton absorption lineshape. M.Schreiber, Y.Toyozawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.290-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A standardized formulation of the lineshape problem, i.e. the effect of lattice vibrations on the exciton absorption, is used in a Monte-Carlo-investigation of the direct and indirect absorption lines for different dimensionalities and temperatures. With respect to the low-energy tails the empirical Urbach rule is established. The analysis of the average-oscillator-strength-per-state (AOSPS) spectra allows the authors to unambiguously ascribe this behaviour to momentarily localized states. The introduction of a steepness index which can be determined from the calculated Urbach tails enables them to predict whether exciton self-trapping takes place. The predictions are in excellent agreement with various experimental observations. (9 refs.)

67471 Core excitons in semiconductors with a decaying core hole. G.Strinati (Istituto di Fisica 'G. Marconi', Univ. di Roma, Roma, Italy).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.293-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
It is shown that deviations from static electronic screening, in addition to contributing an increase of the core-exciton binding energy E_B, produce also a reduction of the core-exciton spectral width Γ as compared with the corresponding spectral width γ of the core hole alone. The occurrence of this effect

is interpreted as a fingerprint of dynamical screening since it cannot be obtained within the framework of a static theory. Numerical estimates for the Si 2p transition give about 70 meV for the difference γ-Γ, in qualitative agreement with experimental data. (14 refs.)

67472 Thermodynamical calculation of multiexciton complexes system in lightly doped Si: A contribution of excited states of the multiexciton complexes. A.L.Karuzskii, L.Yu.Shchurova, B.G.Zhurkin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Solid State Commun. (USA), vol.46, no.3, p.247-9 (April 1983).
The authors propose the ideal equilibrium approximation for the study of multiexciton complexes system. The composition of the system is calculated using the shell model. The resulting temperature dependences of the complexes concentrations in Si:P agree with the known experimental data. They also stress the role of the contribution of excited states of the complexes. (8 refs.)

67473 Electron-hole droplets size at equilibrium. M.Combescot (Groupe de Phys. des Solids, Ecole Normale Superieure, Paris, France), C.Benoit a la Guillaume.
Solid State Commun. (USA), vol.46, no.7, p.579-82 (May 1983).
A finite lifetime τ implies that the liquid phase can only form droplets of finite size. Introducing this finite τ in the usual nucleation theory, one can obtain analytical expressions for the electron-hole droplet size, number and exciton density in the steady state, in the limit of large τ. This equilibrium size results, in fact, from a Maxwell construction using an appropriate chemical potential. (7 refs.)

67474 Diamagnetic excitons and parameters of energy bands of indium antimonide crystals. L.M.Kanskaya, S.I.Kokhanovskii, R.P.Seisyan, Al.L.Efros.
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1315-17 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2037-41 (Nov. 1982). [received: April 1983]
The authors investigate the diamagnetic exciton spectra of InSb crystals in order to obtain more information on the discrete structure of Wannier-Mott excitions[1]. They calculate accurately the binding energy of diamagnetic excitons as well as to give quantitative and qualitative interpretations of the spectra. The experiments were carried out on indium antimonide single crystals mainly of n-type conduction with an electron density and mobility $n=6.10^{13}$ cm^{-3} and $\mu=600000$ cm^2.V^{-1}.sec^{-1} at T=77K. (13 refs.)

67475 Relaxation of hot excitons in polar semiconductors. C.Trallero Giner, O.Soto-Longo Costa, I.G.Lang, S.T.Pavlov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1544-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2734-31 (Sept. 1982). [received: April 1983]
The probabilities of the 'normal' scattering W_s, of the scattering $W^{(n)}$ involving transitions to an excited state characterized by the principal quantum number n, and of the decay W_d of a hot Wannier-Mott exciton interacting with longitudinal optical phonons (*LO*) at finite temperatures are calculated. Computed results are obtained for arbitrary kinetic energies E_{kin} of an exciton including the effect of the Coulomb interaction between an electron and a hole. Moreover, the asymptotic behavior of W_s, $W^{(n)}$, and W_d is derived for kinetic energies $E_{kin} \gg \hbar\omega_{LO}$, where $\hbar\omega_{LO}$ is the energy of *LO* phonons. An approximate expression for $W^{(n)}$ in the limit $n \gg 1$ is also obtained. Actual calculations are carried out for CdS, CdTe, CdSe, and ZnTe. (22 refs.)

67476 Role of composition fluctuations in exciton spectroscopy of solid solutions of semiconductors. A.G.Plyukhin, L.G.Suslina (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1551-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2738-46 (Sept. 1982). [received: April 1983]
Experimental studies of exciton reflection, exciton-phonon luminescence, and resonant Raman scattering spectra of solid solutions of II-VI compounds are used to analyze the role of composition fluctuations of the solid solution in these effects. Two mechanisms for the interaction of excitons with the fluctuating field of the solid solution lattice are compared: localization of excitons with low kinetic energy by the potential wells of the random lattice field, and elastic scattering of free excitons by fluctuational distortions of the lattice. Analysis of the frequency dependences of the resonant Raman effect indicates that elastic scattering of excitons is important in many-phonon Raman scattering processes. It is shown that the probability of elastic scattering of excitons by static lattice distortions in solid solutions of II-VI compounds may become comparable with the probability of scattering by longitudinal optical phonons and make a significant contribution to the homogeneous broadening of the exciton states. (11 refs.)

67477 Drift of excitons in nonuniformly illuminated crystals. V.N.Strekalov (Machine-Tool Inst., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1640-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2894-7 (Oct. 1982). [received: April 1983]
A study is made of gradient or boundary effects which result in the appearance of forces exerted by phonons or free electrons on various crystal imperfections in a spatially nonuniform optical field. The example of excitons is used to illustrate a possible application of such forces to displace imperfections in crystals. (6 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

67478 Surface polariton reflection and radiation at end faces. R.F.Wallis, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.764-6 (1 May 1983).
A theoretical investigation has been made of surface polariton reflection and radiation at the end face of a metal slab. Dielectric materials of dielectric constants ϵ_d and ϵ_d' lie above and beyond the end of the metal slab, respectively. Energy transmission and reflection coefficients have been calculated for a surface polariton incident on the end face of the metal slab for various slab thicknesses when $\epsilon_d=\epsilon_d'=1$ and $\omega_p/\omega=4$. The energy reflection coefficient has also been investigated as a function of ϵ_d with $\epsilon_d'=1$. The angular distribution of the radiation pattern has also been studied for two different ϵ_d. (8 refs.)

67479 Applications of surface polaritons for vibrational spectroscopic studies of thin and very thin films. G.N.Zhizhin, E.A.Vinogradov, M.A.Moskalova, V.A.Yakovlev (Inst. of Spectroscopy, Acad. of Sci., Moscow, USSR).
Appl. Spectrosc. Rev. (USA), vol.18, no.2, p.171-263 (1982-1983).
Studies of the surface state of solids, their detection, and studies of the surface transition layers including oxide films, physi-, and chemisorbed monomolecular films, their transformations at phase transitions and their chemical reactions have stimulated the development of a series of new methods. The nondestructive character of optical methods, their sensitivity to molecular structure and to the nature of chemical bonding, makes them very attractive for use. The main problem with optical methods is that their signal-to-noise ratio is often very low because the small thickness of films inevitably yields small signal changes in absorption, emission, or scattering of light. So, in order to accumulate signals for increasing the sensitivity of methods, it is necessary to find new physical procedures and to obtain new tools for use in thin film spectroscopy. This is one of the main developments in optical spectroscopy over recent years. They include computer accumulation systems with ordinary slit spectrometers and with Fourier transform spectrometers, emission spectrometry in possitive and negative light fluxes, enhanced Raman scattering, photoacoustic spectroscopy, reflection-absorption spectroscopy, and multireflection systems. In this sense the new facilities show promise in their applications to surface phonon-polaritons and plasmon-polaritons for optical spectroscopic studies of thin films on the surfaces of solids. The surface polaritons and plasmons being localized on the surface are extremely sensitive to the presence of thin films. (112 refs.)

67480 Kinetics of polariton luminescence. V.V.Travnikov, V.V.Krivolapchuk (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
JETP Lett. (USA), vol.36, no.6, p.242-5 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.196-8 (20 Sept. 1982). [received: April 1983]
A manifestation of exciton kinetics has been studied experimentally in the shape of the polariton luminescence spectra for the first time. The spectral shape depends on the exciton lifetime. The basic factors determining the shape are identified. (11 refs.)

67481 Two-photon K-space spectroscopy to determine the mixed-mode polariton dispersion in AgGaS$_2$. D.Frohlich, K.Reimann (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.392-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors report the observation of mixed mode exciton polaritons in AgGaS$_2$ by two-photon absorption. By changing the magnitude of the total K-vector and its direction with respect to the crystalline axis they are able to resolve resonances on the upper polariton as well as on the pure longitudinal exciton. The results can be quantitatively explained by the polariton theory for uniaxial crystals. (11 refs.)

67482 Exciton polaritons in monoclinic zinc diphosphide. R.S.Berg, P.Y.Yu (Dept. of Phys., Univ. of California, Berkeley, CA, USA), T.Mowles.
Solid State Commun. (USA), vol.46, no.2, p.101-4 (April 1983).
A classical theory based on excitons is insufficient to explain the reflectivity spectra of β-ZnP$_2$. Instead an exciton polariton picture is invoked and the polariton parameters are determined. Photoluminescence spectra are consistent with the polariton interpretation. Higher energy states of the exciton have been observed and from these the band gap and exciton binding energy in β-ZnP$_2$ have been deduced. (13 refs.)

67483 Effect of a temperature gradient on the spectra of A_1 polaritons in lithium niobate. V.S.Gorelik, L.G.Reznik, B.S.Umarov (S.U. Umarov Physicotech. Inst., Acad. of Sci., Dushanbe, Tadzhik SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1803-4 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3176-8 (Oct. 1982). [received: April 1983]
The authors report the first study of the effect of temperature gradients on the polariton Raman scattering spectra in lithium niobate. (9 refs.)

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

67484 Theoretical analysis of optical-phonon deformation potentials in semiconductors. A.J.Hernandez-Cabrera, J.Sanchez-Dehesa, C.Tejedor (Dept. de Fisica del Estado Solido, Univ. Autonoma de Madrid, Cantoblanco, Spain).
J. Phys. C (GB), vol.16, no.12, p.2251-9 (30 April 1983).
A method to compute the electronic and structural properties of semiconductors self-consistently is applied to analyse the electron-phonon interaction in these crystals. The authors have calculated the optical-phonon deformation potentials along the symmetry directions in Si, Ge and GaAs. Their results confirm the previous ones obtained in more simplified approaches. Quantitative discrepancies with experimental data suggest what must be the next step to be taken in the theoretical effort. (20 refs.)

67485 Instabilities of polarons in high magnetic fields. F.M.Peeters, J.T.Devreese (Dept. Natuurkunde, Univ. Instelling Antwerpen, Wilrijk, Belgium).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.567-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The free energy of a polaron in a magnetic field is calculated. Feynman's polaron theory (1955) is extended to take into account the anisotropy of the effective electron-phonon interaction. In this approximation the polaron has an instability for certain values of the electron-phonon coupling strength (α), temperature (T) and magnetic field strength (H). It is suggested that this instability is connected with a discontinuous two-dimensional stripping of the polaron in the direction perpendicular to the magnetic field. (9 refs.)

67486 Cyclotron resonance studies of polarons and screening effects in GaAs. G.Lindemann, W.Seidenbusch, R.Lassnig, J.Edlinger, E.Gornik (Inst. fur Experimentalphys., Univ. Innsbruck, Innsbruck, Austria).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.649-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Polaron effects are studied in bulk n-GaAs by cyclotron resonance measurements under hot electron conditions. Good agreement between calculations and experiments is obtained. The Frohlich parameter determined is close to the literature value. An accurate treatment of polaron effects is necessary for the determination of the bandedge effective mass. In GaAs-$Ga_xAl_{1-x}As$ heterojunctions the influence of the free carrier concentration on the cyclotron resonance linewidth is investigated and screening is found to be ineffective. Polaron effects are weaker than determined in bulk samples. (7 refs.)

67487 The effective polaron mass in a gapless semiconductor HgTe. U.S.Pashabekova (V.I. Lenin State Pedagogical Inst., Baku, Azerbaidzhan SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1604-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2831-4 (Sept. 1982). [received: April 1983]
The author applies the method of Beni and Rice (1977) to the calculation of the polaron internal energy to the case of the HgTe band structure. The calculation is performed within the framework of the standard perturbation theory. (4 refs.)

71.45 COLLECTIVE EFFECTS

67488 CDW phase transition in $NbSe_3$ and related compounds. J.Rouxel, A.Meerschaut, P.Gressier (Lab. de Chimie des Solides, Nantes, France).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.263-8 (March 1983).
Some basic features of CDW's instabilities are recalled. Then, $NbSe_3$ and some related compounds such as monoclinic TaS_3 and the (Fe-Nb)Nb_2Se_{10} series, are the basis of an experimental illustration of the concepts. $NbSe_3$ exhibits two CDW phase transitions at T_1 (145K) and T_2 (59K). The feature which makes $NbSe_3$ unique is the nonohmicity observed at very low electric field (few tenths of $mV.cm^{-1}$) just below T_1 and T_2. It is now well established that this nonlinear effect results from the depinning of a CDW, which carries a current. The conclusion is indicative of the role of the anion pairing in the triangular base of the trigonal prism, of the cation pairing along the chain and of the interchain coupling. (36 refs.)

67489 Theory of discommensurations and re-entrant lock-in transition in the charge-density-wave state of 2H-$TaSe_2$. K.Nakanishi, H.Shiba (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1278-89 (April 1983).
Charge density wave (CDW) states of 2H-$TaSe_2$ are studied on the basis of Jacobs and Walker's free energy. Discommensuration (DC) structures are inspected in detail under the situation where the stable commensurate (C) states change from one to another as the interlayer coupling constant is increased. Numerical calculations, in which a sufficiently large number of harmonics are taken into account, exhibit double honeycomb, triangular and hexagonal DC structures. The formation mechanism of various DC structures is discussed and compared with McMillan's DC diagram. Crossing over between different DC structures is also studied. Phase diagrams in the temperature and interlayer coupling plane are constructed to explain the re-entrant lock-in transition of 2H-$TaSe_2$. In this connection a suggestion is made on the nature of the high pressure C state. (24 refs.)

67490 Quantum fluctuation of a dislocation in a two-dimensional Wigner crystal. M.Kawano (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan), K.Ohashi, Y.H.Ohashi, M.Fukuchi.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1298-305 (April 1983).
The authors have investigated the mean-square displacement of dislocation axis in a two-dimensional Wigner lattice and the results are applied to the effects of quantum fluctuations to a dislocation core. The core size is of the order of an inter-particle spacing. (14 refs.)

67491 Tunneling investigation of charge density wave energy gap in 1T-TaS_2. H.Ozaki, T.Mutoh, H.Ohshima, A.Okubora, N.Yamagata (Dept. of Electrical Engng., Waseda Univ., Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.590-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The charge density wave induced energy gap has been observed by tunneling measurements over the nearly-commensurate phase of 1T-TaS_2. The energy gap stays near 0.5 eV from 215K up to around 280K, and above this temperature it decreases with increasing temperature. In addition to the structures giving the energy gap, a group of peak structures connected with the charge density waves have been observed in the dI/dV vs. V curves of the tunneling junctions, though the origin of those is not clarified yet. Connections of the energy gap with the electronic properties of this material are discussed. (11 refs.)

67492 Ground-state energy of a two-dimensional charge-density-wave state in a strong magnetic field. D.Yoshioka, P.A.Lee (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4986-96 (15 April 1983).
The charge-density-wave state of two-dimensional electrons which occupy only the lowest Landau level is investigated. The previous Hartree-Fock calculation by Yoshioka and Fukuyama [J. Phys. Soc. Jpn. 47, 394 (1979)] is extended to include the higher harmonics of the density wave. The correction of the Hartree-Fock ground-state energy is calculated by second-order perturbation theory. Effects of higher Landau levels are also estimated. It is found that the ground-state energy is a smooth function of ν, the filling factor of the lowest Landau level. (14 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

67493 Ground state correlation in the two-dimensional polarized electron gas. P.M.Lam (Inst. of Theoretical Phys., Chinese Acad. of Sci., Beijing, China).
Z. Phys. B (Germany), vol.50, no.4, p.337-42 (1983).
The ground state energy and radial distribution functions of the polarized two-dimensional electron gas with valley degeneracy n_v=1 and 2 are calculated using the hypernetted-chain approximation with the effective correlation factor method for fermions. The paramagnetic susceptibility is calculated and compared with experiment for silicon inversion layers. (24 refs.)

67494 Plasmon excitation by Coulomb scattering of electrons in 2D systems. R.A.Hopfel, E.Gornik (Inst. fur Experimentalphys., Univ. Innsbruck, Innsbruck, Austria), A.C.Gossard, W.Wiegmann.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.646-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reports new far infrared emission experiments from radiative decay of two-dimensional plasma waves. The excitation is generated by a heating of the electron gas in the applied electric field. Local fluctuations of the charge density require for plasma wave excitation an additional momentum exchange,

which is provided by Coulomb scattering. Radiative decay of magnetoplasmon excitations is studied. The intensity drastically decreases with magnetic field, and the dispersion of the magnetoplasmon agrees with theory up to magnetic fields of 3.5 Tesla. (14 refs.)

67495 The dielectric screening and magnetic instabilities in an interacting electron gas. O.V.Dolgov, E.G.Maksimov, S.N.Rashkeev (Phys. P.N. Lebedev Inst., Moscow, USSR).
Solid State Commun. (USA), vol.46, no.2, p.151-3 (April 1983).
The values of a parameter r_s are investigated, for which (a) the static dielectric function becomes negative, (b) the transition into the spin polarized state takes place. (8 refs.)

67496 Two-dimensional plasmons in hole space charge layers on silicon. E.Batke, D.Heitmann, A.D.Wieck, J.P.Kotthaus (Inst. fur Angewandte Phys., Hamburg, Germany).
Solid State Commun. (USA), vol.46, no.3, p.269-71 (April 1983).
The authors have observed two-dimensional plasmons in hole space charge layers of silicon. On Si(110) surfaces the plasmon mass depends on the charge density and shows a significant anisotropy for different directions of the plasmon wavevector in the surface. The determination of the plasmon mass allows detailed informations on the anisotropic and nonparabolic 2-D bandstructure of hole space charge layers. (13 refs.)

67497 Self-consistent nonlocal potentials near planar surfaces. Z.Penzar (Inst. of Phys., Univ. of Zagreb, Croatia, Yugoslavia), M.Sunjic.
Solid State Commun. (USA), vol.46, no.5, p.385-8 (May 1983).
A new derivation of the self-consistent dynamically screened nonlocal Coulomb potential near a planar surface is presented, based on the integral equation approach. The exact solution is obtained without restrictions on the dynamical response of the solid (e.g. RPA in metals), the type of surface potential or electronic density profile, and without additional matching or boundary conditions. This makes the present approach particularly useful e.g. in the general discussion of model-independent screening phenomena at metal surfaces. The application to the calculation of matrix elements for electron and ion excitation of collective modes and electron-hole pairs is formulated, and the connection with the previous results discussed. (10 refs.)

67498 Static polarizability of metal clusters and the related blue shift of the dipolar surface plasmon. W.Ekardt, D.B.Tran Thoai, F.Frank, W.Schulze (Fritz-Haber-Inst., Berlin, Germany).
Solid State Commun. (USA), vol.46, no.7, p.571-4 (May 1983).
The blue shift of the dipolar surface plasmon of small metal clusters is studied with the use of sum rule techniques due to Lushnikov et al. (1965, 1974). The static polarizability needed for the application of this technique is obtained by solving Poisson's equation for the total electrostatic potential of a small metal particle placed in an external electric field. The screening properties of the metal electrons are described within the modified Thomas-Fermi approximation. The ground state charge density determining the local Thomas-Fermi wavenumber is obtained from a variational estimate of the total energy of the metal electrons. The static polarizability obtained is smaller than the classical value R^3 (where R is the cluster radius) but larger than the value following from the step density Thomas-Fermi approximation. Correspondingly, the surface plasmon frequency is blue shifted from its classical value but red shifted from its step-density value. The shift is strongly r_s-dependent, where r_s is the well known electron gas parameter. (20 refs.)

67499 Anomalous increase in the dielectric function of thin semiconducting films in contact with metals. A.A.Bugaev, Yu.M.Gerbshtein (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1606-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2834-6 (Sept. 1982). [received: April 1983]
The authors report an unusually large increase in the dielectric function ε of V_2O_5 and Si films in contact with various metals (Hg, Al, and a eutectic In-Ga alloy). The films were deposited by vacuum thermal sputtering (V_2O_5) and electron-beam heating (Si) on glass or sapphire substrates in a vacuum of 10^{-6} torr. The dielectric function ε was determined from the frequency interval $\Delta\omega$ between interference fringes in the reflection spectra of the films. In all three cases the change in ε due to contact with metals was qualitatively the same; the authors discuss the results for the Hg contacts. (5 refs.)

67500 Analytic calculation of the structural properties of semiconductors. G.Mula (Istituto di Fisica, Univ. di Cagliari, Cagliari, Italy).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.579-81 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A semiclassical approximation is proposed for the calculation of the structure dependent part of the total energy. Its simplicity allows one to obtain analytic expressions for important quantities such as the equilibrium lattice constant and the bulk modulus. Detailed calculations have been made for the diamond-like semiconductors. No free parameter appears in the theory, for which the only input is from separately computed pseudopotentials. The accuracy of the results is not critically dependent on the details of the pseudopotential. The formalism is also suitable for the investigation of structural phase transitions. As an example an analysis is given of the zincblende to rocksalt phase transition. (12 refs.)

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

67501 Molybdenum chalcogenides: clusters, chains, and extended solids. The approach to bonding in three dimensions. T.Hughbanks, R.Hoffmann (Dept. of Chem., Cornell Univ., Ithaca, NY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1150-62 (9 March 1983).
A combined molecular orbital and crystal orbital analysis of system containing $Mo_{3n}X_{3n+2}$ (n=2, 3, 4, ∞; X=S, Se, Te) units is presented. The modes of packing Mo_6X_8, Mo_9X_{11}, and $Mo_{12}X_{14}$ clusters into crystals are explained in terms of the cluster frontier orbitals. Intercluster Mo-X bonds are seen to result from an interaction between chalcogen donor orbitals and the cluster LUMOs that are localized on Mo atoms residing in the 'square faces' of the clusters. Closed-shell electron counts for the clusters are elucidated. The relationship between the cluster frontier orbitals and surface states is discussed. Finally, relationships between the band structure of $(Mo_3X_3^-)_\infty$ chains and the finite cluster molecular orbitals are explained. (39 refs.)

67502 Magnetoresistive determination of localization effects in InSb. R.C.Dynes, T.H.Geballe, G.W.Hull,Jr., J.P.Garno (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5188-91 (15 April 1983).
The authors have made magnetoresistance measurements in samples of n-InSb in the temperature range 0.05-1.5K. The carrier densities of the samples studied were $\sim 3.1\times10^{14}$ and $2.7\times10^{13}/cm^3$. At low fields (<50G) the negative magnetoresistance is interpreted as being due to orbital effects, and a detailed comparison with theory is made. The strength of the observed effects with applied field H is 0.55 of that expected from theory. Interaction effects could explain the discrepancy. The inelastic scattering localization rate is determined to vary as T^3. (22 refs.)

67503 Self-localization of a conduction electron in magnetically ordered crystals. V.D.Lakhno (Sci.-Res. Computing Center, Pushchino, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1578-81 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2787-93 (Sept. 1982). [received: April 1983]
The conditions for the formation of self-localized states in antiferromagnets are analyzed. Criteria for the stability of such states are derived. Cases of weak and strong external magnetic fields are discussed. (8 refs.)

71.55 IMPURITY AND DEFECT LEVELS

67504 Evidence that the gold donor and acceptor in silicon are two levels of the same defect. L.-A.Ledebo (Innovance AB, Lund, Sweden), Zhan-Guo Wang.
Appl. Phys. Lett. (USA), vol.42, no.8, p.680-2 (15 April 1983).
A photocapacitance method was used to monitor the time dependences of the occupation numbers for the gold-related donor and acceptor in silicon during optical excitation. The experimental data give strong evidence that the donor level corresponds to the +/0 transition and the acceptor to the 0/- transition for one single defect. (4 refs.)

67505 Defect nature of the 0.4-eV center in O-doped GaAs. D.C.Look, S.Chaudhuri (Univ. Res. Center, Wright State Univ., Dayton, OH, USA), J.R.Sizelove.
Appl. Phys. Lett. (USA), vol.42, no.9, p.829-31 (1 May 1983).
The authors have studied the $E_c-0.4$ eV center in O-doped GaAs by a combination of temperature-dependent Hall-effect measurements, spark-source mass spectroscopy, and secondary-ion mass spectroscopy. The conclusion is that neither O nor any other impurity can account for the 0.4-eV center; therefore, it is a pure defect. (20 refs.)

67506 A novel technique for studying electric field effect of carrier emission from a deep level center. G.P.Li, K.L.Wang (Device Res. Lab., Univ. of California, Los Angeles, CA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.838-40 (1 May 1983).
A new reverse-bias pulsed deep level transient spectroscopy technique (RDLTS) is reported for studying the electric field effect of carrier emission from a deep level defect. The technique uses a reverse-bias pulse whose duration controls the emission of the carriers from a narrow region. The electric field in the region is determined by the pulse height used. The subsequent transient signal due to the capture of carriers by the defect states in the narrow region, in contrast with the emission signal in conventional DLTS, was obtained. The technique is extremely simple to use and requires no additional equipment when using a conventional DLTS setup. Formulation of this approach and the experimental results using this technique were given to illustrate the validity and simplicity of the technique. (6 refs.)

67507 Crystal-field energy levels of $BeAl_2O_4:Cr^{3+}$. Wu Guang-zhao, Zhang Xiu-rong (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Acta Phys. Sin. (China), vol.32, no.1, p.64-70 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The $^4T_2$, $^4T_1$, and ^2E levels of Cr^{3+} ion on the mirror-site in an alexandrite crystal are in relation to the laser operation of the material. The $^4T_2$ (or $^4T_1$) level splits into three sublevels. In order to determine the energy level diagram of Cr^{3+} ions in chrysoberyl, the splitting of the $^4T_2$ and $^4T_1$ are calculated. The authors discuss the anisotropic transition intensities of corresponding absorption bands and finds a method to fit the spectra. Furthermore, the values of the parameters K_1 and K_2 that represent the magnitude of the splitting are obtained, and the crystal field energy level diagram of $BeAl_2O_4:Cr^{3+}$ (II), labelled by the irreducal representations of point group C_s, is given. (10 refs.)

67508 Influence of odd parity crystal field on level splitting of Ce^{3+} ions. Yang Gui-Lin, Xu You, Chu Da-Ping, Xue Deng-Ping, Zhai Hong-Ru (Dept. of Phys., Nanjing Univ., Nanjing, China).
Acta Phys. Sin. (China), vol.32, no.2, p.259-66 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The authors calculate the influence of *5d-4f* mixing caused by odd parity crystal field on level splitting of Ce^{3+} ions in CaF_2 and SrF_2 lattices. Results indicated that odd parity crystal field effect on level splitting may be fairly large. For lower levels in CaF_2 the contribution of odd parity crystal field may amount to 15-30%. The order of 1st and 2nd excited states even reverses. On the other hand, it has been shown that configuration mixing is one of the possible mechanisms causing the extension of radial wave functions of ions in crystal. (8 refs.)

67509 Different strategies of approach to the problem of local defects in crystals. C.Pisani (Inst. of Theor. Chem., Univ. of Turin, Torino, Italy).
THEOCHEM (Netherlands), vol.10, p.35-48 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The perturbed crystal and perturbed cluster approaches to the problem of local defects in crystals are critically compared: in the two cases the host crystal solution and the isolated cluster solution respectively are taken as a useful intermediate quantity to which suitable correction operators are applied. Particular attention is given to the case where system-specific, non-complete basis sets are adopted. Recent results obtained by applying the two methods to a simple model system are briefly discussed. (19 refs.)

67510 Thermal donors in silicon: consistent interpretation of Hall-effect and capacitance transient spectroscopy. W.Keller, K.Wunstel (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Appl. Phys. A (Germany), vol.A31, no.1, p.9-12 (May 1983).
Thermal donors are generated in oxygen-rich silicon by an anneal at 450°C. The energy-levels of these donors are investigated by capacitance transient spectroscopy (DLTS) and the Hall effect. A level at 125 meV below the conduction band observed with DLTS exhibits a strong dependence on the electric field (Poole-Frenkel effect). Evaluation with a novel model for the Poole-Frenkel effect leads to a corrected zero-field energy of 200 meV for this level. The Hall effect indicates two thermal donors at 57 and 120 meV below the conduction band; both centers cannot be observed with the capacitance-DLTS method due to the Poole-Frenkel energy reduction by 70 meV ± 10 meV. The 45 meV current-DLTS level is shown to correlate with the 120 meV Hall level. (14 refs.)

67511 Study of impurity states in a *n-n* GaAs-AlGaAs heterojunction using cyclotron resonance and Shubnikov-de Haas experiments. H.Sigg, H.W.Myron, P.Wyder (Res. Inst. for Materials & High Field Magnet Lab., Univ. of Nijmegen, Nijmegen, Netherlands), D.A.Poole, M.Pepper, R.W.Glew.
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.637-46 (1982).
The electronic structure of two *n-n* GaAs-AlGaAs heterojunctions is studied using far-infrared cyclotron resonance and Shubnikov-de Haas effect. Shallow impurity states, similar to the so called 'hydrogenic' impurities, are found in both systems. It is found that these impurity states lead to a freezing out of electrons from the conduction band with decreasing temperature. (9 refs.)

67512 Electronic structure of the divacancy in silicon. R.G.Humphreys (Royal Signals & Radar Establ., Malvern, England), S.Brand, M.Jaros.
J. Phys. C (GB), vol.16, no.12, p.L337-43 (30 April 1983).
The vacancy and divacancy (V_2) in silicon are assumed to be strongly coupled to the lattice via a linear Jahn-Teller process. Consequently, the lattice coordinate of the defect should strongly reflect the defect charge state. The authors report experimental and theoretical evidence which shows that the thermal broadening of the $V_2^+ \rightarrow V_2^0 + h$ optical transition is too small to be compatible with the above model. It would appear that the Jahn-Teller effect is relatively weak, and that the lattice coordinate of the defect is independent of charge state. (23 refs.)

67513 Excited states of double donors in silicon. M.Altarelli (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.122-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A calculation of the binding energy of excited states of an electron bound to a substitutional +2e point charge in Si is presented. Direct and umklapp intervalley interactions are included. Very large valley-orbit splittings for 1s and 2s levels are obtained, whereas p-like and ns levels ($n \geq 3$) are well described by one-valley effective-mass theory. The spectrum is in fair agreement with recent experiments on chalcogen donors. (12 refs.)

67514 Electronic structure of self-interstitials and sp-bonded interstitial impurities in semiconductors. J.P.Vigneron, M.Scheffler, S.T.Pantelides (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.137-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors report parameter-free self-consistent pseudopotential Green's-function calculations of the electronic structure of self-interstitials in Si at tetrahedral sites and of P and C interstitials in GaP, also at the tetrahedral sites. They find that the number, relative energy positions, and wavefunction character of the localized states of deep interstitials are strikingly similar to those of deep substitutional donor impurities and explain this result in terms of simple physical considerations. In the case of the Si self-interstitial, the results are significantly different from earlier results of Extended-Huckel calculations. The authors find no deep states in the energy gap, which provides a natural explanation of the fact that self-interstitials at tetrahedral sites have not been detected by either EPR or DLTS. The results have also motivated a reinterpretation of experimental data on the migration of self-interstitials. (12 refs.)

67515 Oxygen in gallium phosphide—a canonical deep donor. P.J.Dean (Royal Signals & Radar Establ., Great Malvern, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.140-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The classical description (CD) and major dissenting interpretations (DI) of the properties of the ultra-deep donor O_p in GaP are reviewed. Two charge states of isolated O_p exist, as well as associates with a wide variety of acceptor-like impurity species. Accurate information on energy levels, state symmetries, vibronic coupling and ionisation cross-sections is available from optical data, and upon concentrations and capture cross-sections from electrical capacitance spectroscopy. Radiative and non-radiative recombinations both occur through O_p, the latter including both multi-phonon and Auger processes. Thus, this single system uniquely provides illustrations of all major electronic processes of interest at deep states. All substantive properties can be interpreted through CD where the properties of O_p are described by a straightforward extension from the behaviour of the familiar shallow donors. The need for and validity of some of the major DI is examined. (30 refs.)

67516 The electronic states of oxygen in gallium phosphide. T.N.Morgan (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.146-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Existing theoretical models do not account for a number of important electronic properties of oxygen in GaP. The author describes a new (MO) model based on spin multiplets formed from the four neighboring gallium bond orbitals and show that it provides a detailed explanation of these properties in terms of spin- and k-conserving one-electron transitions. (9 refs.)

67517 Dissociation of (Zn,O) pairs in GaP. R.M.Feenstra, T.C.McGill (California Inst. of Technol., Pasadena, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.149-51 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The athors have observed photoinduced reactions in which nearest-neighbor (Zn,O) pairs in GaP dissociate, and subsequently re-form as further separated pairs. From reaction rate measurements, they find that the dissociation is induced by electron-hole recombination at the defect. A theoretical analysis is presented of the vibrational modes which may be involved in the reaction. (18 refs.)

67518 Auger effect at localized impurities in semiconductors. J.M.Langer, A.Suchocki, Le Van Hong, P.Ciepielewski, W.Walukiewicz (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.152-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Theoretical and experimental investigation of the Auger effect at localized impurities are presented. Theoretically estimated Auger coefficients well agree with that found experimentally for Mn^{2+} and Gd^{3+} in conducting CdF_2 crystals. (4 refs.)

67519 Physical properties of the deep X electron trap responsible for long time persistent photocapacitance in CdS. M.Housin, M.Fialin, G.Sagnes, G.Bastide, M.Rouzeyre (Centre d'Etudes d'Electronique des Solides, CNRS, Univ. Sci. et Technol. du Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.155-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Describes the main physical properties of a very deep electron trap which is responsible for the long time persistent photocapacitance of Schottky diodes on undoped CdS single crystals. TSCAP and DLTS have been used to determine the apparent thermal activation energy $E_a=0.925$ eV and the apparent electron capture cross section $\sigma_\infty=5.5\times10^{-15}$ cm^2 of these centers. Photocapacitance measurements have been performed at various temepratures to allow the determination of the spectral dependence of the photoionisation cross section. The deduced optical threshold E_n° of the 'bound state to the free conduction band state' transition is 2.5 eV. This transition gives a long tail absorption near the fundamental edge which is unambiguously identified by the thermal emptying of the X centres. The large difference between $E_a+0.925$ ev and $E_n^\circ=2.5$ eV is explained in the large lattice relaxation model. These values are consistent with the results of experiments which locate the X centres, under quasi-equilibrium conditions, at 0.87 eV below the conduction band. They also agree with the results of direct measurement of the thermal activation energy of the electron capture cross section $E_B=0.2$ eV. The low temperature quenching of both electron emission and capture is responsible for very large persistent photocapacitance effects which suggest that these X centres are acceptor like and probably correlated with cadmium vacancies. (12 refs.)

67520 Transition metal impurities in InP: defect complexes and native defects. A.Sibille, E.V.K.Rao, A.Mircea (CNET, Bagneux, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.176-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Transition metal elements are introduced into InP and the induced deep levels are studied. A Mn related electron trap is detected, possibly due to a complex like Mn_{In}-Vp. Cu introduces several deep levels for which a tentative identification of the centers involved is Cu_{In}, Cu_{In}-donor, Cu_{In}-Vp. (14 refs.)

67521 Electronic structure of substitional 3d transition atom impurities in silicon. A.Zunger, U.Lindefelt (Solar Energy Res. Inst., Golden, CO, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.185-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reports the results of a self-consistent calculation within the local density approximation for all the substitutional 3d transition atom (TA) impurities in an extended silicon host crystal using the quasi band Green's function method. Chemical trends in the gap state energies and 3d-like resonances are discussed as well as trends in the effective electronic configuration of TA impurities. An explanation for the remarkable property that many different charged states of TA impurities exist in the narrow band gap, despite the fact that the corresponding ionized states of the free TA span a range of ~60 eV, is proposed. (2 refs.)

67522 Deep levels in semiconductors—influence of hydrostatic pressure. W.Jantsch (Johannes Kepler Univ., Linz, Austria), K.Wunstel, O.Kumagai, P.Vogl.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.188-90 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Isothermal transient capacitance measurements provide a simple and yet extremely sensitive tool for the determination of pressure coefficients of deep level energies. Results for the chalcogen donors S, Se and Te in Si are in good agreement with predictions from the semiempirical model by Hjalmarson et al. (1980). In contrast to the chalcogen donors, the levels of interstitial Fe, Mn, V and Ti in Si move towards the valence band under pressure. A qualitative explanation is given for this anomaly. (13 refs.)

67523 Pairs of intrinsic defects in III-V semiconductors electronic states and interaction energies. T.L.Reinecke (Naval Res. Labs., Washington, DC, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.194-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The electronic properties of pairs in intrinsic defects involving vacancies and antisites in the III-V systems GaAs, GaP, AlAs, InP, and InAs are studied. The electronic states of these defect pairs as well as the total electronic interaction energies between the two defects are evaluated. Calculations are performed using the recursion method and are based on tight-binding Hamiltonians. (9 refs.)

67524 Dynamical theory of recombination-enhanced defect reactions. H.Sumi (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.197-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Violent lattice vibrations around a deep-level defect triggered by nonradiative capture of an injected minority carrier enhance greatly defect reactions such as movement and production of a defect during thermalization of them. The capture occurs at a critical value of a configuration coordinate Q_1 while the reaction occurs when another one Q_2 exceeds a critical value. The capture gives rise to a damped oscillation of Q_2 when Q_2 is not perpendicular to Q_1 in the phonon-coordinate space. When the total vibration energy deposited upon capture is E_i, the activation energy of reaction is reduced from its thermal-equilibrium value E_A to E_A-E_i for $E_i<g^2E_A$, to $(\sqrt{E_A}-g\sqrt{E_i})^2/(1-g^2)$ for $g^2E_A<E_i<E_A/g^2$, and to zero for $E_i>E_A/g^2$, where g represents the direction cosine between Q_1 and Q_2. (10 refs.)

67525 Study of ideal vacancies in CdS and CdSe in the wurtzite structure. K.Tchakpele, J.P.Albert, C.Gout (Centre d'Etudes d'Electronique des Solides, Univ. Sci. et Technol. du Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.200-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The electronic states of ideal vacancies in CdS and CdSe are calculated using a Green function method. First, the electronic band structure of these compounds is computed within a tight-binding approximation. It is then shown that cation vacancies may induce bound states inside the fundamental gap while the anion vacancies are found to behave as acceptors yielding a deep level situated at 0.35 eV (0.45 eV) above the valence band in CdS (CdSe). (10 refs.)

67526 Impurity states in n-type $Hg_{1-x}Cd_xTe$ in high magnetic field and under hydrostatic pressure. A.Raymond, J.L.Robert, D.S.Kuriakos (Centre d'Etudes d'Electronique des Solides, Univ. Sci. et Technol. du Languedoc, Montpellier, France), M.Royer.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.428-30 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have recently shown (ref. unob.) that the magnetic freeze-out can be observed in narrow gap $Hg_{1-x}Cd_xTe$ alloys ($0.18\leq x\leq 0.34$). For the less doped samples the existence of a resonant level is clearly pointed out. This level is responsible for a large trapping of the electrons when the magnetic field increases. The application of a hydrostatic pressure confirms the existence of this level: in zero magnetic field, when the pressure increases, the conductivity decreases strongly and then varies with a smaller slope. This implies a strong decrease of the free carrier density in the low pressure range and a change in the conduction process. They observed an activated conduction from a hydrogenic donor. (no refs.)

67527 The exchange contribution to the binding energy of acceptors in CdMnTe. J.Jaroszynski, T.Dietl, M.Sawicki, E.Janik (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.473-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Results of measurements of the resistivity as a function of the temperature and composition of p-type $Cd_{1-x}Mn_xTe$ are reported. It is shown that at low temperatures the increasing of the binding energy with x originates from the formation of the bound magnetic polaron whereas at high temperatures from thermodynamical fluctuations of magnetization. (10 refs.)

67528 Quantitative measurements of magnetic polaron binding on acceptors in CdMnTe alloys. Tran Hong Nhung, R.Planel (Ecole Normale Superieure, Univ. Paris VII, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.488-90 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The acceptor binding energy is measured as a function of temperature and composition in $Cd_{1-x}Mn_xTe$ alloys, by time resolved spectroscopy. The bound magnetic polaron effect is measured and compared with a theory accounting for magnetic saturation and fluctuations. (11 refs.)

67529 A deep-impurity model for acceptors in silicon. G.Cerofolini (SGS, Milan, Italy).
Philos. Mag. B (GB), vol.47, no.4, p.393-405 (April 1983).
A new model for acceptors in silicon is proposed. This model assumes that the neutral ground state has sp^2 hybridization and that the chemical shift of the ionization energy is associated with the elastic energy involved in the $sp^2\rightarrow sp^3$ change in hybridization. This hypothesis involves significant changes in the description of both equilibrium and transport properties. (18 refs.)

67530 Energy shift of hydrogenic donors in a magnetic field due to electric and strain fields. P.A.Fedders (Dept. of Phys., Washington Univ., St. Louis, MO, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4799-803 (15 April 1983).
Calculates the second-order shifts in the energies of the 1*s* and 2*p*-states of hydrogenic donors in a magnetic field due to electric fields and combination of electric and strain fields in a piezoelectric medium. The results are discussed as a possible explanation of different line shapes and linewidths associated with different donors as observed in photoconductivity experiments on GaAs. (13 refs.)

67531 Ground-state energy of a D^- ion in two-dimensional semiconductors. D.E.Phelps, K.K.Bajaj (US Air Force Wright Aeronaut. Labs., Avionics Lab., Wright-Patterson Air Force Base, OH, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4883-6 (15 April 1983).
The ground-state energy of a D^- ion (a donor impurity ion with two attached electrons) in a two-dimensional semiconductor is calculated using a variational approach and in two dimensions is found to be about -4.48 Ry. The ground-state energy of a -hydrogenic system in two dimensions is known to be -4 Ry. Thus the binding energy of a D^- ion, defined as the energy required to remove one of the two electrons from the D^- ion to infinity, is about 0.48 Ry. This is about 12% of the ground-state energy of a hydrogenic system in two dimensions. This is to be compared with the binding energy of a D^- ion in three dimensions which is 5.55% of the hydrogenic ground-state energy. The relevance of the results of the problem of a D^- ion in thin-quantum-well structures is discussed. (14 refs.)

67532 Electronic structure of substitutional chalcogen impurities in silicon. V.A.Singh (Solar Energy Res. Inst., Golden, CO, USA), U.Lindefelt, A.Zunger.
Phys. Rev. B (USA), vol.27, no.8, p.4909-23 (15 April 1983).
The authors report the results of a first-principles calculation of the electronic structure of substitutional, unrelaxed, and neutral chalcogen impurities (O),S, and Se) in silicon. They have employed the recently developed quasi band crystal-field defect Green's-function method. They find that whereas atomistic models predict that the binding energies of donor levels in semiconductors increase with the ionization potential of the free impurity atoms, a special enhancement of the screening in the solid predicts, for chalcogen impurities in silicon, a reversal in this order. Their results are in excellent agreement with recently reported optical excitation data available for Si:S and Si:Se. They demonstrate that whereas oxygen shows the expected *sp* bonding to the host crystal, sulfur and selenium exhibit also significant *d* bonding by utilizing their virtual *d* states. They discuss the relevance of effective-mass-type calculations to chalcogen impurities in the light of the results. (54 refs.)

67533 Impurities in semimetals. M.Ya.Azbel (Bell Labs., Murray Hill, NJ, USA).
Solid State Commun. (USA), vol.46, no.2, p.113-15 (April 1983).
Localization in semimetals and semiconductors strongly depends on the character of disorder. The resistance may decrease when the concentration of vacancies increases, and may be anomalously low for small size substitutions. (7 refs.)

67534 Influence from free-carrier tails in deep level transient spectroscopy (DLTS). E.Meijer (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden), L.-A.Ledebo, Zhan-Guo Wang.
Solid State Commun. (USA), vol.46, no.3, p.255-8 (April 1983).
DLTS spectra of deep level impurities in semiconductors often display anomalies such as zero offsets, steps or peaks with reversed signs. For a correct interpretation of the spectra it is important to understand those features. They are explained here, and shown to be related to the presence of free-carrier tails which extend into the depletion region of a semiconductor junction. Gold-doped silicon and the so-called *A*- and *B*-levels in GaAs are chosen for illustration of the effects. (13 refs.)

67535 Capacitance spectroscopy investigation of defects formed in *n*-type silicon by neutron irradiation. A.V.Vasil'ev, S.A.Smagulova, S.S.Shaimeev (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1279-81 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1983-6 (Nov. 1982). [received: April 1983]
The capacitance (deep-level transient spectroscopy) method was used to study *n*-type silicon subject to irradiation with reactor neutrons and a subsequent isochronous annealing to temperatures of ~700°C. Immediately after irradiation the spectrum of deep levels had three peaks, two of which were due to an *A* center (a level at $E_c-0.18$ eV) and a divacancy in the charge state $W^{=}$(a level at $E_c-0.23$ eV). The third peak was a composite of three levels: $E_c-0.34$, $E_c-0.39$ (W^-), and $E_c-0.44$ eV (*E* center). Annealing transformed the disordered regions created by neutrons and caused complex changes in the deep-level spectra: several new defect centers appeared as well as a 'broad' deep-level spectrum due to the superposition of many types of defect. The rates of introduction of vacancies were different in the matrix and the impurity-defect shells surrounding disordered regions. (9 refs.)

67536 Causes of a strong field dependence of the electron capture cross sections of deep impurity levels in a semiconductor with conduction band valleys of various energies. Yu.V.Vorob'ev (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1312-13 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2033-5 (Nov. 1982). [received: April 1983]
The author investigates the possibility of interpreting the electron capture cross section of deep impurity levels on the basis of ideas relating to the Auger capture mechanism involving bound carriers. In this case, evidently, the energy state of the carriers may be of decisive importance; that is, the transfer of the electron to a higher valley may 'switch on' the Auger mechanism, which is capable of giving very large values of cross section. (5 refs.)

67537 Dependence of a hydrogen-like impurity spectrum on the magnetic field orientation in the crystal. Sh.M.Kogan, A.F.Polupanov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1327-9 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2055-8 (Nov. 1982). [received: April 1983]
In cubic semiconductors with conduction electrons having an isotropic effective mass, the shallow donor impurity centers are hydrogen-like in the effective-mass approximation. The effective-mass approximation is not valid near

the impurity atom ('central cell') itself. The resolution achieved in the spectroscopic measurements makes it necessary to examine the dependence of the spectrum on the magnetic field orientation in the crystal as a result of the central cell correction. The authors include in the unperturbed Hamiltonian of the crystal-impurity system the field of the perfect crystal and the smooth part of the impurity potential, together with the magnetic field. (7 refs.)

67538 Some properties of trapping levels formed as a result of a high-temperature treatment of *n*-type Si. E.V.Astrova, V.B.Voronkov, A.A.Lebedev (A.F. Ioffe Physicotech. Inst. Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1339-40 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2074-5 (Nov. 1982). [received: April 1983]
Thermal defects characterized by the same temperature dependence of the rate of thermal generation of carriers give rise to electron trapping levels near the middle of the band gap. The authors consider some of the properties of these deep levels. Trapping levels were formed as a result of a high temperature heat treatment of n-Si. A study of the isothermal relaxation of the capacitance showed that the upper half of the band gap had two deep levels with fixed ionization energies E. When the diode structures were illuminated with light from a GaAs light-emitting diode, only the upper level captured holes at temperatures 77-160K and there was no charging of the lower level. (4 refs.)

67539 Optical properties of deep centers in semi-insulating ZnSe. E.J.Bawolek, B.W.Wessels (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).
Thin Solid Films (Switzerland), vol.102, no.3, p.251-8 (22 April 1983).
Properties of deep levels in vapor-deposited ZnSe on GaAs have been investigated using transient photocurrent and steady state photocapacitance measurements. A metal/insulator/semiconductor structure was used in the study in which ZnSe formed the insulator. A single dominant deep level in the ZnSe having an energy of E_c-1.2 eV was observed over the spectral region 0.5-3.0 eV. The photoionization cross section of the trap at 1.5 eV and 295K is 7×10^{-16} cm^2. Trap concentrations in the range 10^{16}-10^{17} cm^{-3} were measured in the as-grown material. (16 refs.)

71.55J Localization in disordered structures

67540 Electronic properties of doped polyacetylene. J.P.Albert, C.Jouanin (Centre d'Etudes d'Electronique des Solides, Univ. Sci. Tech. de Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.620-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A model calculation of impurity states in polyacetylene is presented. Two possible perturbations introduced by the dopant have been investigated, a localized and an extended one. The possibility of a soliton lying on the chain is considered and the interaction with the impurity is investigated according to their relative positions. The authors then study the electronic structure of polyacetylene at higher doping levels within the soliton lattice model. The closing of the gap is found to occur at a concentration of solitons of 7%. (6 refs.)

67541 Effective correlation energy of the dangling bond in amorphous silicon. D.Adler, F.R.Shapiro (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.932-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The current theoretical and experimental situation with regard to the sign of the effective correlation energy of the dangling-bond defect in amorphous silicon-based alloys is reviewed. It is concluded that the defect could well have a negative effective energy if complete atomic relaxations occur. (19 refs.)

67542 Local structure and electronic states in hydrogenated amorphous silicon. B.Kramer, H.King (Phys.-Tech. Bundesanstalt, Braunschweig, Germany), A.MacKinnon.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.944-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Presents results for the local density of electron states, and the charge distribution in a cluster model of hydrogenated amorphous silicon. The authors use a Weaire-Thorpe type Hamiltonian, which was suitably modified to include the H-atoms. If the parameters in the Hamiltonian are taken so as to reproduce the H associated peaks in the valence bands, which are observed in photoemission, there is an average charge transfer from Si to H of −0.27 e in agreement with earlier findings on infrared, and proton magnetic resonance spectra. (13 refs.)

67543 Estimation methods for localized-state distribution profiles in undoped and phosphorous-doped *a*-Si:H. S.Furukawa, N.Matsumoto (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Phys. Rev. B (USA), vol.27, no.8, p.4955-60 (15 April 1983).
The effective temperature which characterizes the localized states of hydrogenated amorphous silicon (*a*-Si:H) has been obtained by measuring the space-charge-limited currents, photoconductivity dependences on the incident-light intensity, and transient photocurrents in a series of phosphorous-doped films. The effective temperatures obtained by those three methods coincide for the highly doped specimens. For the undoped specimens, however, the coincidence is not as good because of recombination effects. (13 refs.)

67544 Temperature dependence of electron-capture cross section of localized states in *a*-Si:H. H.Okushi, T.Takahama, Y.Tokumaru, S.Yamasaki, H.Oheda, K.Tanaka (Electrotech. Lab., Ibaraki, Japan).
Phys. Rev. B (USA), vol.27, no.8, p.5184-7 (15 April 1983).
A temperature dependence of the electron-capture cross section [$\sigma_n(E,T)$] of the gap states in *a*-Si:H was determined for the first time by isothermal capacitance transient spectroscopy. A bump was observed on the gap-state profile of lightly P-doped *a*-Si:H and $\sigma_n(E,T)$ increases as temperature increases. From this temperature dependence as well as the energy dependence of $\sigma_n(E,T)$ reported previously, it is concluded that the bump of gap-state profile is located approximately 0.5 eV below the conduction-band mobility edge and multiphonon emission predominates in the electron-capture process at the gap states near the bump. It is strongly suggested that the bump structure originates from doubly occupied dangling-bond states. (13 refs.)

67545 Studies of the gap states density in undoped and doped amorphous hydrogenated silicon. J.Kocka, M.Vanecek, J.Stuchlik, O.Stika, E.Sipek, H.T.Ha, Ha.A.Trisk (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.443-7
Density of the gap states in undoped and phosphorus and antimony doped n-type a-Si:H has been determined from the absorption coefficient measurement. A constant photocurrent method was used to determine the value of optical absorption in a low absorption region. A quantitative model has been suggested to determine the density of states (DOS) within a gap below the Fermi level from the spectral dependence of the absorption coefficient. The model is based on a Gaussian shaped maximum, connected with the dangling bonds, between the exponential valence and conduction band tails. The doping rises this maximum in the DOS. (14 refs.)

67546 Theory of order-disorder transitions for inhomogeneous mixed-valence systems. J.L.Moran-Lopez (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany), P.Schlottmann.
Phys. Rev. B (USA), vol.27, no.8, p.5122-5 (15 April 1983).
A simple alloy-analogy model for inhomogeneous semiconducting mixed-valence compounds is extended to include the coupling of the long-range charge-order parameter to the lattice. For weak coupling to the lattice the order-disorder transition is of second order, while it is of first order in the case of strong phonon coupling. The authors calculate the entropy, the conductivity, and the thermal dilation close to the transition and discuss the results in view of recent experiments for Eu_3S_4. (7 refs.)

67547 Valence change of Sm ion in $Eu_{1-x}Sm_xSe$. K.Kojima, S.Nishizawa, K.Hiraoka, T.Hihara, T.Kamigaichi (Faculty of Integrated Arts & Sci., Hiroshima Univ., Hiroshima, Japan).
Solid State Commun. (USA), vol.46, no.5, p.417-18 (May 1983).
Crystallographic and magnetic investigations of $Eu_{1-x}Sm_xSe$ mixed crystals have been made. The x dependence of the lattice constant shows a deviation from the usual Vegard law and suggests an intermediate valence of Sm ions in EuSe host, which is about 2.3 for $x \leq 0.2$. The substitutive Sm ion influences magnetic properties of EuSe as a non-magnetic ion with smaller ionic radius than the Eu^{2+} ion. (7 refs.)

67548 The cluster-lattice interaction in the calculation of the electronic structure of $CrF_6{}^{3-}$ in K_2NaCrF_6. Z.Barandiaran, L.Pueyo, F.Gomez Beltran (Dept. de Quimica Fisica, Univ. de Oviedo, Oviedo, Spain).
J. Chem. Phys. (USA), vol.78, no.7, p.4612-18 (1 April 1983).
The cluster-lattice interaction involving the $CrF_6{}^{3-}$ in K_2NaCrF_6 has been analyzed, in the way proposed by Pueyo and Richardson [J. Chem. Phys. 67, 3583 (1977)] by computing the lattice potential with the Ewald method and introducing an analytical representation of it in the cluster Fock matrix before self-consistency. Many different expressions have been tested in order to obtain the best representation of the Ewald results. All of them have been centered in the metal site. The partition of this interaction in core-lattice and valence-lattice portions reveals that the earlier procedure of centering the lattice potential function on the ligand site is inappropriate for improving the cluster in-vacuo calculation of the equilibrium metal-ligand distance. The new results go in the required direction, but the effects of the interaction are now uniformly small. These effects have been examined in several properties, including the 10Dq, the ground state vibrational frequency $\bar{\nu}(a_{1g})$, the horizontal displacement of the ${}^4T_{2g}$ with respect to the ${}^4A_{2g}$, the vertical Stokes shift associated with these two states and the ligand-to-metal charge transfer originated in the SCF process. (20 refs.)

67549 Calculation of crystal field theory of Mn^{3+} in piemontite. Xu Zitu, Zheng Chusheng, Peng Mingsheng (Guiyang Inst. of Geochem., Acad. Sinica, Beijing, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1199-203 (Nov. 1982). [received: April 1983]
Piemontite is a Mn^{3+}-bearing silicate mineral with neso-silicate structure. Isomorphism exists with epidote and clinozoisite. Space group $P2_1/m$. The structural formula may be written as $Ca_2(Al, Fe, Mn)O_6.AlO_4(OH)_2.Al_6.SiO_4.Si_2O_7$. Piemontite is different from epidote and clinozoisite mainly in that Mn^{3+} enters into the epidote structure and replaces a position of Fe^{3+} and Al, thus showing strong pleochroism. The pleochroism formula is: α=yellow, β=pink and γ=red. The authors measured the polarized absorption spectra of piemontite from the Shilu Iron Mine, Hainan Island on a refitted microscope-spectrophotometer. The spectral pattern is in agreement with that given by Burns (1967) from St. Marcel, Piemonte, Italy. Based on the spectral pattern and the structural data of Dollase (1969), the Mn^{3+} crystal field potential for piemontite can be calculated theoretically. The result of our calculation is in keeping with the experimental spectrum band and it has explained the occurrence of strong pleochroism in piemontite and the stability of Mn^{3+} ion in piemontite structure. (3 refs.)

67550 Electric field gradient of single impurities in aluminum. L.M.Kahn (Phys. Dept., Univ. of Rhode Island, Kingston, RI, USA), F.Perrot, M.Rasolt.
Phys. Rev. B (USA), vol.27, no.8, p.5110-12 (15 April 1983).
Single substitutional impurities of Mg, Zn, Ga, Ge, and Si in Al universely show very small electric field gradients at the second-nearest-neighbor sites, in obvious disagreement with theoretical calculations. The authors show that this does not likely reflect the neglect of nonspherical contributions to the induced charge density around the impurity. (18 refs.)

67551 Nuclear orientation of thermally prepared ${}^{114m}InCu$ by the brute-force method. J.Boysen, W.D.Brewer, A.Kettschau (Fachbereich Phys., Freien Univ. Berlin, Berlin, Germany).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.249-55 (Feb. 1983).
The authors report the results of brute-force orientation experiments on several alloys of ${}^{114m}InCu$ prepared by different thermal methods, with the goal of clarifying the origins of the deviations from the theoretical nuclear orientation effect reported by several groups for this system. In particular, using thin diffused samples they obtain essentially the same attenuation as previously reported for both ${}^{114m}In$ and ${}^{111}In$ implanted into Cu crystals and foils. Thicker diffused or melted samples show less or more attenuation, respectively. They find no evidence for thermal gradients between samples and thermometers as a cause for the observed deviations. (15 refs.)

67552 Effect of chemical structure on the electron density at the tellurium nucleus. E.Hartmann (Zentralinst. fur Isotopen- & Strahlenforschung, Akad. der Wissenschaften, Leipzig, Germany), M.Rysavy.
Hyperfine Interactions (Netherlands), vol.13, no.4, p.257-62 (Feb. 1983).
Reports results of a study in which the Xα-SW method is employed to deduce estimates of the differences in the electron densities at the Te nucleus in some compounds. On the basis of these estimates some assertions are deduced to the calibration problem of the Mossbauer nuclide ^{125}Te and to the chemical influence on the IC of the 35.5 keV M1+E2 transition in ^{125}Te. 72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

67553 Magnetoresistance in Anderson-localized systems. H.Kamimura, A.Kurobe, T.Takemori (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.652-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Magnetoresistance in the Anderson-localized regime is calculated by the percolation method, with a particular purpose of investigating the effects of electron-electron interaction on it. It is predicted that the interplay of the intrastate interaction and the energy dependence of localization lengths gives rise to the competition of positive and negative contributions in the field dependence of the magnetoresistance. Further, combined with the interstate interactions, the temperature change in the magnetoresistance of IT-TaS_2 and its alloy systems is explained satisfactorily. Finally, the correlation of the interaction effects on the variable range hopping in the absence and presence of a magnetic field is clarified. (13 refs.)

67554 Quantized Hall conductance and edge states: Two-dimensional strips with a periodic potential. R.Rammal, G.Toulouse, M.T.Jaekel, B.I.Halperin (Lab. de Phys., Ecole Normale Superieure, Paris, France).
Phys. Rev. B (USA), vol.27, no.8, p.5142-5 (15 April 1983).
The authors have investigated the energy levels of an electron in a periodic potential and a magnetic field, confined to a two-dimensional strip of infinite length but finite width, for two sets of boundary conditions. The bulk formula giving the quantized Hall conductance is explained in terms of a special gauge-invariance property of the edge states. This Communication clarifies the role of the geometry in the derivations of the quantized Hall effect. (11 refs.)

67555 Reduced problem of thermoelectricity for isotropic media. V.P.Bulat.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.459-60 (March 1983). In Russian.
Investigates the reduced problem of thermoelectricity for a planar isotropic medium. A solution is obtained which permits one to calculate the temperature fields of various thermoelements. (6 refs.) *V.G.P.*

72.15 ELECTRONIC CONDUCTION IN METALS AND ALLOYS

67556 Electrical and optical properties of polythiophene prepared by electrochemical polymerization. K.Kaneto, K.Yoshino, Y.Inuishi (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
Solid State Commun. (USA), vol.46, no.5, p.389-91 (May 1983).
Electrical conductivities and optical absorptions of neutral and oxidized polythiophene films polymerized by the electrochemical method are reported. The electrical conductivity of polythiophene borofluoride film shows metallic value of ca. 100 S cm^{-1} at room temperature and decreases over 10^{10} times into semiconductive regime by the electro-chemical or chemical undoping. Absorption spectrum of polythiophene changes by the undoping from the characteristic of metal to interband transition with absorption edge ca. 2.0 eV and maximum absorption coefficient of $\sim 10^5$ cm^{-1} at 2.7 eV. (1 ref.)

72.15E Electrical and thermal conduction in crystalline metals and alloys

67557 Electrical conductivity and morphology of silicon in A-S13 and A-S7G. S.Jacob (Centre Tech. des Industries de la Fonderie, Paris, France), A.Remy.
Fonderie - Fondeur d'Ajourd'hui (France), no.22, p.33-41 (Feb. 1983). In French.
The morphological modification of silicon caused by sodium treatment leads to an increase of 20 to 30% in the electrical conductivity in the case of Al-Si13 and about 10% in the case of Al-Si7Mg. Structural hardening, spheroidization or annealing treatments also increase the electrical conductivity. The results obtained make it possible to consider favourably the checking of the structures of these alloys prior to casting by simply measuring the electrical conductivity, provided the test is carried out on an appropriate shop specimen. (10 refs.)

67558 Electrical resistivity of dislocations in metals. M.Kaveh, N.Wiser (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).
J. Phys. F (GB), vol.13, no.5, p.953-61 (May 1983).
An analysis is presented of the sample dependence of the specific dislocation resistivity ρ_D/N_D of metals. In contrast to the usual assumption, ρ_D/N_D is not taken to be independent of the dislocation density N_D present in the sample. The N_D dependence of ρ_D/N_D arises from the coupling between electron-dislocation scattering and electron-impurity scattering at low (liquid He) temperatures and from the coupling between electron-dislocation scattering and electron-phonon scattering at higher (liquid N_2) temperatures. The theory is applied to the extensive data available for ρ_D/N_D for Al at 4.2K and at 80K and for Cu at 4.2K, for which conflicting values for ρ_D/N_D have been reported by different workers. Good agreement is found between theory and experiment. (20 refs.)

67559 Concentration and temperature dependence of the electrical resistivity of quenched PdH_x. B.M.Geerken, R.Griessen (Naturkundig Lab., Vrije Univ., Amsterdam, Netherlands).
J. Phys. F (GB), vol.13, no.5, p.963-73 (May 1983).
The hydrogen concentration dependence of the electrical resistivity $\rho(x)$ of rapidly cooled PdH_x samples is investigated at 4.2K and 77.4K for $0 \leq x \leq 0.015$. The resistivity data show that the hydrogen atoms are homogeneously distributed in the host metal up to a concentration $x \approx 0.005$. In this regime $d_\rho/dx = 25$ $\mu\Omega$ cm. This value is reproduced by a simple model where scattering between electron states on the Γ sheet on the Fermi surface and between states on the Γ sheet and the d band jungle-gym is taken into account. This model leads to a maximum in $\rho(x)$ at $x=0.4$ for temperatures above the critical temperature $T_c=566$K of the PdH_x system. Below T_c (especially at 4.2K) the concentration dependence of ρ is dominated by the segregation in the α and α' phases for $0 \leq x \leq 0.65$. In this concentration range the experimental data can be described by assuming a random distribution of dilute α phase spheres in the α' phase PdH_x matrix. (25 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

67560 Negative mobility in the extreme quantum limit of transverse galvanomagnetic conduction. B.K.Ridley (Dept. of Phys., Univ. of Essex, Colchester, England).
J. Phys. C (GB), vol.16, no.12, p.2261-4 (30 April 1983).
A non-equilibrium delta-function distribution of carriers can move up the potential energy gradient associated with an electric field as a consequence of the energy dependence of the quasi-one-dimensional density of states, characteristic of magnetic quantisation. (7 refs.)

67561 Gadolinium-heavy rare earth alloys: preparation, metallographic study and extraordinary Hall effect. R.Asomoza, A.Fert, R.Reich (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.177-201 (April 1983).
The authors present a study of the extraordinary Hall effect (EHE) in gadolinium containing rare earth impurities. The alloys were melted in an argon atmosphere (in sealed tantalum crucibles) or in a dynamic vacuum (in tantalum crucibles with a delayed leak). The Hall effect measurements show that the EHE induced by rare earth impurities in gadolinium is the sum of a skew scattering contribution proportional to the impurity resistivity $\Delta\rho_0$ and a side jump term proportional to $\Delta\rho_0{}^2$. The dependence of the EHE on the rare earth impurity indicates that it is mainly due to spin-orbit coupling of the conduction band (rather than to orbital exchange) and the authors develop an appropriate method to interpret their results. By extending their model to the EHE of the pure rare earth metals, they show that it arises mainly from side jump scattering and they present a quantitative interpretation of the EHE of pure gadolinium. (36 refs.)

67562 On the possible relation between the absence of superconductivity in Au and Pd-Ag alloys and the negative sign of the Hall coefficient. I.M.Chapnik (Dept. of Phys., Univ. of London, London, England).
J. Phys. F (GB), vol.13, no.5, p.975-8 (May 1983).
Available data are presented which support the supposition that metals and alloys with a negative low-temperature Hall coefficient are apparently not superconducting. (18 refs.)

67563 Field dependence of the galvanomagnetic coefficients in lead single crystals. H.Sato, Y.Imai, K.Yonemitsu (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).
J. Phys. F (GB), vol.13, no.5, p.1071-9 (May 1983).
The authors have measured the transverse magnetoresistance and the Hall coefficient of lead single crystals for the field along the [100] and the [110] axes. Emphasis has been placed on their field dependence and on their temperature dependence in the intermediate-field range. The field-dependent galvan-

omagnetic coefficients have also been computed by path integration based on the 4 OPW Fermi surface model. The agreement between experiment and the computation is very good, though some discrepancies remain for the field along the [110] axis in the high-field range. At lower temperatures, some deviation from Kohler's rule is found in the low-field Hall coefficient. (27 refs.)

67564 Investigation of magnetic films by the anomalous Hall-effect. G.Bergmann (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.68-73 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Magnetic moments scatter conduction electrons asymmetrically and yield the anomalous Hall-effect (AHE). This method has been applied to measure the suppression of the magnetism of Ni on top of different non-magnetic metals. Ni looses its magnetic moments on polyvalent metals such as Mg, In and Sn up to thicknesses ranging between 2 and about 3 atomic layers whereas on top of the noble metals it already shows magnetic moments for thicknesses of 1 atomic layer of Ni. Fe on top of the polyvalent metals Sn, In and Pb shows with increasing coverage between 2% of a monolayer and 1.6 monolayer a transition from magnetically free moments via a two-dimensional spin glass to a ferromagnetic state. The magnetic behavior of Fe on top of a Pd, surface suggests a reduced Stoner enhancement of the Pd surface, compared with the bulk Pd. (37 refs.)

67565 Magnetoresistivity of amorphous alloys containing rare earths. D.Eichler (Inst. Le Bel, Univ. Louis Pasteur, Strasbourg, France), J.C.Ousset, S.Cantaloup, A.Berrada, J.Durand.
J. Phys. Colloq. (France), vol.43, no.C-9, p.671-5 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Reports the results of low-temperature anisotropic magnetoresistivity ($\Delta\rho_A$) measurements in moderate steady field (up to 45 kG) and in high pulsed field (up to 300 kG) on various series of amorphous alloys containing non-S state Rare-Earths (RE). For $RE_{80}Au_{20}$ alloys, $\Delta\rho_A$ is negative for all the heavy RE. For $RE_{67}Co_{33}$ alloys, $\Delta\rho_A$ in moderate field exhibits between Ho and Er the change of sign expected for dominant contribution from RE quadrupole scattering. But, in high field, $\Delta\rho_A$ becomes negative as for amorphous $RE_{80}Au_{20}$. For dilute $La_{80-x}RE_xAu_{20}$ alloys (x being a few %), the quadrupole contribution to $\Delta\rho_A$ is unambiguous. From the field and temperature behavior of $\Delta\rho_A$, the nature of the ground state for Pr, Nd, Tb, Dy and Tm in amorphous $La_{80}Au_{20}$ is discussed together with an estimate of the energy gap between the ground state and the first excited states. (19 refs.)

67566 Temperature dependence of the Hall coefficient of CuBe2 between 6 and 300K. S.Feid, V.Groger, F.Stangler (Tieftemperaturphys., Inst. fur Festkorperphys., Univ. Wien, Wien, Austria).
Z. Metallkd. (Germany), vol.74, no.4, p.246-9 (April 1983). In German.
Samples of CuBe2 have been annealed at 325°C for different aging times resulting in differing defect structures as GP-zones and γ'-precipitates. The temperature dependence of the low field Hall coefficient of these samples is investigated between 6 and 300K. The maximum ratio of inclination for every curve except the sample with the highest matrix concentration varies according to the anisotropy change confirming also for this case the validity of the two group model for dilute alloys. Thus the temperature dependence of the aged samples confirms, that the observed decrease of the Hall coefficient with growing temperature can be ascribed to the anisotropy change due to γ'-phase formation. Thermoelectric and magnetothermoelectric quality factors of bismuth and solid solutions of the bismuth-antimony system .... See Entry 67567

72.15J Thermoelectric effects

67567 Thermoelectric and magnetothermoelectric quality factors of bismuth and solid solutions of the bismuth-antimony system. V.S.Zemskov, A.D.Belaya, P.G.Borodin (A.A. Baikov Inst. of Metall., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.7, p.974-7 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1154-7 (July 1982). [received: Feb. 1983]
The alloy $Bi_{85}Sb_{15}$ has the highest thermoelectric quality factor (at 100K, ZT=0.62). At 180-210K, the thermoelectric quality factors of alloys containing 3-10 at.% of antimony are practically equal. The highest increase in the thermoelectric efficiency in a magnetic field is that observed in the alloys $Bi_{86}Sb_{14}$ and $Bi_{85}Sb_{15}$ (the value of ZT for these alloys is 1.4 at 180 and 164K in magnetic fields of 1.2 and 1 T respectively). (10 refs.)

67568 Magnetic thermoelectric power of $Fe_{20}Ni_{60}B_{10}Si_{10}$ metallic glass. K.Pekala, M.Pekala, R.Trykozko (Inst. of Phys., Warsaw Tech. Univ., Warsaw, Poland).
Solid State Commun. (USA), vol.46, no.5, p.413-15 (May 1983).
The magnetic contribution to the thermoelectric power was separated for the metallic glass $Fe_{20}Ni_{60}B_{10}Si_{10}$ which exhibits the ferro-paramagnetic transition at T_c=455K remarkably below the crystallization threshold T_x=670K. Results are compared with the predictions of the Kasuya theory (1959). (20 refs.)

67569 High pressure thermopower and electrical resistance measurements in $CeSn_3$, $CeAl_3$, $CeAl_2$ and $CeIn_3$. V.Vijayakumar, S.N.Vaidya (Chem. Div., Bhabha Atomic Res. Centre, Bombay, India), E.V.Sampathkumaran, R.Vijayaraghavan.
Solid State Commun. (USA), vol.46, no.7, p.549-51 (May 1983).
The thermopower and electrical resistance of $CeSn_3$, $CeAl_3$, $CeAl_2$ and $CeIn_3$ are reported as a function of pressure at room temperature. The thermopower curves of $CeSn_3$, $CeAl_3$ and $CeAl_2$ exhibit maxima at about 25, 40 and 80 kbar respectively. These maxima are attributed to the occurrence of continuous valence transitions of Ce ions in these compounds. No such transition is observed in $CeIn_3$ in the pressure range of investigation. (19 refs.)

72.15N Collective modes, e.g. in one-dimensional conductors

67570 Ten years of X-ray diffuse scattering studies of one-dimensional conductors and superconductors. R.Comes (Lab. de Phys. des Solides, Univ. de Paris Sud, Orsay, France).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.269-71 (March 1983).
Competing effects in real one-dimensional conductors have considerably enriched the original structural picture of the instability of a single metallic chain. Such effects include transverse as well as longitudinal polarizations of the Peierls distorsion, instabilities on different molecular chains, 2 and 4 k_F instabilities, and commensurability effects. In the more recent class of organic superconductors $(TMTSF)_2X$, superconductivity is not only in competition with the Peierls instability but also with order-disorder phase transitions involving the noncentrosymmetric counter ions. (34 refs.)

67571 One dimensional transport along dislocations. R.Labusch (Inst. fur Angewandte Phys., Clausthal, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.203-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Dislocations in most semiconductors are straight on an atomic scale due to the existence of a high Peierls potential. Consequently, bound states in the dislocation core are expected to have the properties of one-dimensional quantum mechanical systems. In the first part the possibility of one dimensional metallic conduction is discussed, taking into account knowledge of the core structure of the relevant dislocation typyes, as well as recent theoretical of their core states. In the second part the prospects of experimental detection of one dimensional conduction along dislocations in semiconductors are discussed and examples are given in which the experimental proof of one dimensional conduction has been claimed. (29 refs.)

67572 The electronic and magnetic properties of transition metal dichalcogenide intercalation complexes. R.H.Friend (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.593-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The transition metal dichalcogenides possess a layer structure, and are known to accept a wide variety of electron donor species between layers to form intercalation complexes. Three aspects of the magnetic properties of these systems are considered here. First, the changes in band paramagnetism that can be achieved by the increase in the host material conduction band filling on intercalation are considered. Second, carrier localisation, and the formation of local moments, can be induced in systems with strong charge density wave distortions. The system $IT-TaS_2$+hydrazine is discussed. Third, for the intercalation complexes formed with the 3-d transition metals, the local moments present on the 3-d metal ions show a variety of magnetic orderings which are mediated through the conduction electrons in the host layers. Recent polarised neutron experiments are discussed. (27 refs.)

67573 Highly disordered chain in an electric field. V.N.Prigodin, A.N.Samukhin (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Solid State Commun. (USA), vol.46, no.5, p.379-81 (May 1983).
The nonstationary phenomena in one-dimensional disordered hopping systems in an electric field have been studied. The asymptotics of current as $t \rightarrow \infty$ appears to be crucially dependent on the field strength. While in the weak fields the main contribution to the asymptotics of current originates from relaxation processes near the cluster boundaries, in the strong fields the current asymptotics is due to the carrier hopping within long clusters. The obtained results have been generalized to the quasi-one-dimensional case. (7 refs.)

67574 One-dimensional effects in low-temperature conductivity of ultrathin metallic filaments. V.N.Bogomolov, E.V.Kolla, Yu.A.Kumzerov (A.F. Ioffe Phys.-Tech. Inst., Leningrad, USSR).
Solid State Commun. (USA), vol.46, no.5, p.383-4 (May 1983).
The resistance of ultrathin filaments (UF) of Hg (with diameters 20-40 Å) increases as the temperature is lowered as $\Delta R/R \sim T^{-3/2} (T<60K)$ and decreases with the applied electrical field as $\Delta R/R \sim 1/\sqrt{E}$. The magnitude of this effects increases as the diameter of UF is made smaller. Such temperature dependence is interpreted in terms of weak electron localization in one-dimension. The non-linearity of current-voltage characteristics of UF is due to electron-electron interactions in one-dimensional tunnel junctions. (8 refs.)

67575 Electrical transport in electron beam irradiated polyacetylene. K.Yoshino, S.Hayashi, G.Ishii, Y.Inuishi (Faculty of Engng., Osaka Univ., Osaka, Japan).
Solid State Commun. (USA), vol.46, no.5, p.405-8 (May 1983).
Electrical conductivity of non-doped $(CH)_x$ decreases a little and its activation energy increases a little by the electron beam irradiation. The increase of the electrical conductivity of the irradiated $(CH)_x$ by I_2 doping is not so remarkable compared with that of non-irradiated $(CH)_x$. The conductivity of heavily irradiated $(CH)_x$ is very low even after halogen dopings. On the other hand, the effect of the electron beam irradiation on the conductviity of preivously I_2 doped $(CH)_x$ is much less compared with that doped after the electron beam irradiation. These results are explained tentatively by the role of I_2 molecules in the initial stage of radiolysis and the suppression of the cross-linking. (9 refs.)

67576 Charge density wave transport in a novel inorganic chain compound, $(TaSe_4)_2I$. M.Maki, M.Kaiser, A.Zettl, G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Solid State Commun. (USA), vol.46, no.7, p.497-500 (May 1983).
Reports the observation of nonlinear conductivity with a well-defined threshold electric field E_T, and frequency dependent AC conductivity, in a novel linear chain compound, $(TaSe_4)_2I$. The material undergoes a phase transition to a semiconducting phase at T~260K, and nonlinear and frequency dependent transport is observed below this temperature. The authors argue that the material is a new example of collective mode transport provided by a Peierls-Frohlich charge density wave condensate. (7 refs.)

67577 Observation of Shapiro steps in the charge-density-wave state of $NbSe_3$. A.Zettl, G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Solid State Commun. (USA), vol.46, no.7, p.501-4 (May 1983).
Reports the observation of AC-induced Shapiro-like steps in the DC I-V characteristics of $NbSe_3$. Analysis of the steps in terms of a classical model of charge-density-wave (CDW) transport, mathematically equivalent to the Stewart-McCumber model (1968) of Josephson tunnel junctions, indicates a highly coherent sample response, and that coupling phenomena well known in the Josephson literature also occur for CDW transport. (21 refs.)

67578 Disorder effects in the linear chain compound TiS_3. Pei-Ling.Hsieh, C.M.Jackson, G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Solid State Commun. (USA), vol.46, no.7, p.505-7 (May 1983).
Conductivity (σ) and thermoelectric power (S) measurements are reported in the linear chain trichalcogenide TiS_3. The DC conductivity shows a non-exponential temperature dependence below the conductivity maximum, and σ is also strongly frequency dependent. This, together with the anomalous temperature dependence of S is suggestive of disorder effects in this compound. (13 refs.)

67579 The relaxation of electron-phonon system in the halogen bridged quasi-one-dimensional mixed-valence crystal. H.Tanino.
Solid State Phys. (Japan), vol.17, no.12, p.728-34 (Dec. 1982). In Japanese. [received: April 1983]
Wolffram's red salt and related complexes are introduced. The optical spectra are discussed from the standpoint of the barrierless relaxation process characteristic in the one-dimensional system. (28 refs.)

67580 The stability of current filaments in semiconductor systems that have an inhomogeneity. A.M.Nechayev.
Radio Eng. & Electron. Phys. (USA), vol.27, no.5, p.158-63 (May 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.5, p.1020-6 (May 1982). [received: April 1983]
The effect of small spatial inhomogeneities on the localization and stability of current filaments is examined for semiconductor systems with an S-shaped volt-ampere characteristic. Expressions are obtained that interrelate filament stability and the parameters of the inhomogeneities. The possibility for movement of the filament through the sample by varying the parameters of the system and external circuit is shown. (8 refs.)

67581 Strain scattering of electrons in piezoelectric semiconductors. P.A.Fedders (Dept. of Phys., Washington Univ., St. Louis, MO, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1804-7 (April 1983).
Static strains in piezoelectric semiconductors give rise to an electric field or potential which can have an effect on the electrical properties of the material. The authors have calculated the electric potential due to the strain field arising from a random distribution of point defects. This potential contributes a term to the mobility that is proportional to $T^{1/2}$ and a Hall factor of 1.10. Crude estimates of strain strengths indicate that this scattering mechanism may contribute significantly to the mobility of electrically rather pure III-V semiconductors below room temperature when neutral impurity concentrations are greater than 10^{18} cm^{-3}. The mechanism may also constitute a dominant one in the mobility of some III-V alloys at fairly low temperatures. The existence of strain induced electric potentials also provides at least a possible mechanism whereby different donors can have different line shapes as measured in photoconductivity experiments. (10 refs.)

67582 Electron structure and electrical conductivity of the interface in a semiconductor bicrystal. V.A.Gergel', R.A.Suris.
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1243-6 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1925-9 (Nov. 1982). [received: April 1983]
An analysis is made of the low-temperature of the surface electrical conductivity of the interface in a semiconductor bicrystal. The interface is approximated by a plane with a parallel distribution of edge dislocations separated by a distance which is governed by the angle of rotation between the components of the bicrystal. The self-consistent approximation (Thomas-Fermi method) is used to find the distribution of mobile holes in the vicinity of a single-edge dislocation. The characteristic radius of a hole 'cloud' is found to be $R_0=(a_0^3a)^{1/4}$, where a_0 is the Bohr radius of a hole and a^{-1} is the linear density of the charge in a dislocation core. It is shown that in the case when the distance between the individual dislocations d is greater than $2R_0$, conducting hole regions surrounding individual dislocations are separated from one another by energy barriers. The temperature dependence of the electrical conductivity of the interface in a bicrystal is then of activated nature. The dependence of the activation energy of conduction on the parameters of a bicrystal is determined. In the opposite case of $d<2R_0$ the conducting regions around individual dislocations merge and the temperature dependence of the electrical conductivity is of the metallic type. (7 refs.)

67583 Relaxation of fast electrons in semiconductors at coupled plasmon-phonon oscillations. S.E.Kumekov, V.I.Perel' (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1291-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2001-6 (Nov. 1982). [received: April 1983]
Scattering of fast electrons is considered for energies much greater than both the phonon energy and the kinetic energy of plasma particles in a semiconductor. The total energy losses are then governed by the interaction with both optical phonons and the plasma, i.e. essentially with coupled plasmon-phonon oscillations. The probability that a fast electron escapes from a state with a given quasimomentum as a result of the interaction with these oscillations is calculated as a function of the plasma density. (12 refs.)

67584 Conduction in two-dimensional electron systems having a one-dimensional superlattice. S.V.Kryuchkov, N.P.Mikheev (A.S. Serafimovich State Pedagogical Inst., Volgograd, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1318-19 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2043-4 (Nov. 1982). [received: April 1983]
The authors present a theoretical study of conduction in two-dimensional electron systems having a one-dimensional superlattice in a strong electric field. To solve this problem, they use the theory of electrical conduction in strong electric fields, taking into account the finite width of the conduction band. (8 refs.)

67585 Carrier drag by phonons in semiconductors having an arbitrary isotropic band. B.M.Askerov (S.M. Kirov State Univ., Baku, Azerbaidzhan SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1346-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2083-6 (Nov. 1982). [received: April 1983]
Carrier drag by phonons is treated in a general case, where the motion of carriers in a semiconductor is assumed to be described by an arbitrary isotropic dispersion relation and their degree of degeneracy is arbitrary; the external magnetic field can have any nonquantizing value. It is found that the nonparabolocity of the band and the degree of the degeneracy play an important part in the drag effect, and the former may even be decisive. It is shown that a measurement of the drag thermoelectric power gives immediately the phonon drag force on the carriers. (7 refs.)

67586 On the origin of free carriers in high-conducting n-GaN. W.Seifert, R.Franzheld, E.Butter, H.Sobotta, V.Riede (Sektionen Chem. und Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.383-90 (1983).
Growth experiments with GaN in the system $Ga/HCl/NH_3/He$ at different growth temperatures show that the assumption of N-vacancies to be responsible for the high n-conductivity is questionable. The dependence of carrier concentration on growth temperature as well as the decrease in carrier concentration with additionally purified NH_3 is used indicate that donor impurities are incorporated. The most probable impurity is oxygen, substitutionally incorporated onto N-sites. The observed growth rate dependence of carrier concentration can well be explained by a kinetically controlled incorporation process. (24 refs.)

67587 Influence of intrinsic defects on the electrical properties of $A^IB^{III}C_2^{VI}$ compounds. H.Neumann (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.483-90 (1983).
The electrical parameters of undoped melt grown $A^IB^{III}C_2^{VI}$ crystals are compared with predictions which can be made considering the deviations from stoichiometry due to the incongruent evaporation of these compounds. It is shown that the electrical properties of all $A^IB^{III}C_2^{VI}$ compounds can be interpreted in a consistent manner if the electrical activity (donor or acceptor) of the intrinsic defects is considered within the covalent bonding model. (45 refs.)

67588 The effect of γ-irradiation on amorphous silicon field effect transistors. I.D.French, A.J.Snell, P.G.LeComber (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland), J.H.Stephen.
Appl. Phys. A (Germany), vol.A31, no.1, p.19-22 (May 1983).
Deals with the effect of γ-radiation from a Co^{60} source on the electronic properties of amorphous silicon field effect transistors. These thin film devices, deposited by the glow discharge technique, are being developed for addressable liquid crystal displays, logic circuits and other applications. 1 Mrad (Si) and 5 Mrad (Si) doses were used and the transistors were held at gate voltages between −8 V and +8 V during irradiation. Measurements on irradiated specimens showed shifts in threshold voltage of less than 3 V and a change in transconductance below 10%, both of which could be removed by annealing above 130°C. These results are compared with presently available 'radiation hardened' crystalline silicon device structures and it is concluded that in spite of the thicker gate insulation layer (0.3 μm of silicon nitride) of the amorphous devices, the latter are remarkably radiation tolerant, with little degradation in performance. Measurements on irradiated a-Si films deposited on glass show pronounced conductivity changes, not observed in the transistors. It is suggested that these effects arise at the Si/glass interface, and are prevented by the presence of the silicon nitride film in the devices. (10 refs.)

67589 Mobility of charge carriers in α-HgI$_2$ crystals. M.M.Gospodinov, A.I.Miteva (Inst. of Nuclear Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.12, p.1655-6 (1982).
In spite of the considerable success obtained by using α-HgI$_2$ crystals as nuclear detectors operating at room temperature, there still exist difficulties due to the trapping of carriers. The relatively low drift mobilities and trapping times limit the performances of high energy γ-ray spectrometers. The mobility of charge carriers in α-HgI$_2$ has been investigated. The authors determined the room temperature mobility of charge carriers on crystals grown by the 'temperature oscillation method' where the source temperature was oscillated. (33 refs.)

67590 Resistivity, Hall mobility and leakage current variations in undoped semi-insulating GaAs crystal grown by LEC method. T.Matsumura, H.Emori, K.Terashima, T.Fukuda (Optoelectronics Joint Res. Lab., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L154-6 (March 1983).
The resistivity and Hall mobility (measured at 400K) variations across undoped semi-insulating GaAs wafers obtained from the upper part of the LEC grown ingot have been measured and are compared with the dislocation density variation. It has been found that the resistivity is almost inversely proportional to the dislocation density and Hall mobility is proportional to the logarithm of the dislocation density. The authors have further measured the leakage current variation in comparison with the resistivity and dislocation density variation. Both the leakage current and resistivity show an M shaped variation across the wafers which have a W shaped dislocation density variation.

67591 Peculiarities of the residual conductivity in photoconductor-dielectric materials based on cadmium sulfide. E.F.Afon'ko, A.S.Tonkoshkur, A.Ya.Yakunin (Dnepropetrovsk State Univ., Dnepropetrovsk, USSR).
Inorg. Mater. (USA), vol.18, no.5, p.732-3 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.872-3 (May 1982). [received: Feb. 1983]
Residual conductivity of semiconductor materials based on CdS has been linked with the nonhomogeneity of their structure and the existence of potential barriers. A study is made of the indicated interrelationship in the case of nonhomogeneous substances with a technologically regulated structure, particularly two-component photoconductor-dielectric materials that can be represented by a model of a system of semiconductor particles in a dielectric medium. The results of a study of the temperature dependence of the dark currents [I(T)] for photoconductor-dielectric materials of this type are presented. The I(T) dependences in the case of heating and subsequent cooling do not coincide, and in the low-temperature region the I value recorded during cooling considerably exceeds the corresponding I values in the case of heating. This difference becomes greater as the applied electric field is increased. (3 refs.)

67592 Magnetochemical study of barium titanate doped with tantalum pentoxide. M.A.Kvantov, Yu.P.Kostikov.
Inorg. Mater. (USA), vol.18, no.6, p.830-2 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.988-90 (June 1982). [received: Feb. 1983]
It has been experimentally verified that solid solutions are formed in semiconducting barium titantate doped with Ta_2O_5. At concentrations of Ta_2O_5 exceeding 0.05-0.1 mole %, conducting grains of $BaTiO_3$ are covered with insulating layers which substantially influence the electrical conductivity. (9 refs.)

67593 Electron mobilities and electron-ion recombination rate constants in solid, liquid, and gaseous methane. Y.Nakamura, K.Shinsaka, Y.Hatano (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan).
J. Chem. Phys. (USA), vol.78, no.9, p.5820-4 (1 May 1983).
Electron mobilities and electron-ion recombination rate constants have been measured in methane by an X-ray pulse conductivity technique over the density region from 2×10^{20} to 1.9×10^{22} molecules/cm^3 including the critical region and the liquid-solid phase change. The observed electron mobility abruptly increases on the transition from liquid to solid, which is probably due to the change of isothermal compressibility of methane on the phase change. The observed electron-ion recombination rate constant is in good agreement with the value calculated by the reduced Debye equation in solid methane but not in liquid and gaseous methane. The deviation from the reduced Debye equation is larger in the gas phase than in the liquid phase, which is probably caused by the difference in the efficiency of excess-energy loss of electrons within the reaction radius of electron-ion recombination. (23 refs.)

67594 Temperature dependence of AC conductivity in glassy $As_{40}Se_{60}Ag_x$. K.Hirata (Graduate School of Electronic Sci. & Technol., Shizuoka Univ., Hamamatsu, Japan), M.Kitao, S.Yamada.
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1317-23 (April 1983).
AC conductivity of glassy $As_{40}Se_{60}Ag_x$ ($x=0\sim0.5$) was measured at temperatures from 77K to 400K in the frequency range from 30 Hz to 5 MHz. Below 1 MHz, the AC conductivity $\sigma_{ac}(\omega)$ is proportional to ω^s. In an As_2Se_3 sample ($x=0$), the value of $\sigma_{ac}(\omega)$ depends linearly on the frequency and is nearly independent of temperature. In the samples containing silver, $\sigma_{ac}(\omega)$ increases with silver content, especially at high temperatures and low frequencies. The value of the exponent s is about 1.0 at 80K, and decreases to 0.5 at 350K. Temperature dependence of $\sigma_{ac}(\omega)$ and s in both samples is reasonably interpreted by the correlated barrier hopping model. Numerical calculations in the cases of bipolarons and single-polarons agree well with the experimental results on the samples without silver and those containing silver, respectively. (15 refs.)

67595 Electrical conductivity of Ni-Zn ferrites. R.Satyanarayana, S.Ramana Murthy, T.Seshagiri Rao (Dept. of Phys., Coll. of Sci., Osmania Univ., Hyderabad, India), S.M.D.Rao.
J. Less-Common Met. (Switzerland), vol.90, no.2, p.243-50 (April 1983).
The electrical conductivity σ of polycrystalline Ni-Zn ferrites of various compositions was investigated from room temperature to the neighbourhood of the Curie temperature. The electrical conduction in these ferrites is explained on the basis of the hopping mechanism. Plots of $\log(\sigma T)$ versus $10^3/T$ are almost linear and show a transition near the Curie temperature. The activation energy in the ferrimagnetic region is in general less than that in the paramagnetic region. (20 refs.)

67596 Electrical resistivity of uranium monosulphide. R.Troc, L.Krawczyk (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wroclaw, Poland).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L45-8 (April 1983).
The electrical properties of uranium monosulphide (US) which is a ferromagnet at temperatures below about 180K have been investigated. The authors report resistivity data for US single crystals measured as a function of temperature. The measurements were made in two directions ([100] and [110]) in order to detct any anisotropy in the resistivity behaviour. (12 refs.)

67597 Electrical properties of ion-implanted poly(*p*-phenylene sulfide). H.Mazurek, D.R.Day, E.W.Maby, J.S.Abel, S.D.Senturia, M.S.Dresselhaus, G.Dresselhaus (MIT, Cambridge, MA, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.537-51 (April 1983).
Ion implantation of impurities into thin films of poly(*p*-phenylene sulfide) (PPS) is found to increase the conductivity of the material by up to 12 orders of magnitude. The increase is stable under exposure to ambient conditions, in contrast to the instability of the conductivity increases in PPS produced by chemical doping with AsF_5. PPS films 0.1-0.2 μm thick are spin cast from solution onto interdigitated electrodes patterned on an oxidised silicon substrate. The room-temperature interelectrode resistance is measured as a function of implantation fluence. An estimate of film conductivity is obtained from this resistance with a simple model for the electrode and film geometry. A first experiment yielded similar conductivity increases for implantation of either arsenic or krypton. At a fluence of 1×10^{16} cm^{-2}, which corresponds to an average impurity concentration of 2.5×10^{21} cm^{-3}, the conductivity reaches an apparantly saturated value of 1.5×10^{-5} $(\Omega\ \mathrm{cm})^{-1}$. Infrared spectra of the films before and after implantation suggest that crosslinking may be present in the implanted films, and Auger studies show stoichiometric changes throughout the implanted layer. (30 refs.)

67598 Correlation between electrical and vibrational properties of chlorinated and hydrogenated amorphous silicon prepared by glow discharge. S.Al Dallal, J.Chevallier, S.Kalem, J.Bourneix (Lab. de Phys. des Solides, CNRS, Meudon-Bellevue, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.323-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Electrical conductivity and infrared transmission measurements have been carried out on chlorinated and hydrogenated amorphous silicon films prepared by glow discharge. Upon increasing the plasma power, the authors observed a change of transport mechanism, accompanied by an evolution of hydrogen and chlorine related bands. From this correlation between the transport and the infrared data they suggest that the evolution of $SiCl_2$ species with the plasma power is mainly responsible for the change in bandgap states density and consequently in the transport mechanism. (14 refs.)

67599 Electrical properties of glasses and vitroceramics containing MnO_2. G.Fernandez-Arroyo, C.Moure Jimenez (Inst. de Ceramica y Vidrio, CSIC Arganda del Rey, Madrid, Spain).
J. Phys. Colloq. (France), vol.43, no.C-9, p.419-22 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Compositions of SiO_2-Al_2O_3-Li_2O-MnO_2, SiO_2-ZnO-Li_2O-MnO_2 and SiO_2-MgO-Li_2O-MnO_2 systems have been prepared. The melting temperatures were obtained by high temperature microscopy. Two different melting processes were made; one, in a platinum crucible with induction heating; another in a refractory crucible and gas-fired furnace. Their influence on the properties of the materials obtained is discussed. The transition and crystallization temperatures were determined by DTA and electric conductivity measurements. The crystalline phases were identified by X-ray diffraction. The charge carrier nature and conduction as temperature curves in glass and glass ceramics of every system have been established. A high-field nonohmic behaviour of glass ceramics at several temperatures has been observed. (3 refs.)

67600 Studies on (dark) electric conductance of PVC films. J.Bigalewicz (Inst. Matematyki i Fizyki, Polytech. Rzeszowska, Rezeszow, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.27, no.2, p.74-7 (Feb. 1982). In Polish. [received: March 1983]
The dark volume conductance of films of amorphous PVC prepared by various methods has been investigated. The dependence of the current density of films on temperature in the range of 20-117°C has been studied. The influence of the thickness of PVC film prepared by the method of bulk polymerization on the electric conductance has also been studied. A preliminary estimation of the mobility of charge carriers and of their density at temperatures below and above the glass transition point has been given. (23 refs.)

67601 Low frequency hopping conduction in n-type InSb in the magnetic freeze-out region below 1K. R.Mansfield, C.Zhonggan, P.Fozooni (Bedford Coll., London Univ., London, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.232-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The complex conductivity of n-type InSb has been measured at low frequencies in magnetic field up to 70 kG and for temperatures 1 to 0.04K on two samples. In the magnetic freeze-out region, where conduction is by correlated hopping, $\mathrm{Re}(\sigma)$ is many orders of magnitude greater than σ_{DC} and depends on frequency (ω) as ω^s. Application of the Kramers-Kronig relation to $\mathrm{Im}(\sigma)$ yields the same value of s. Below 0.1K, $s\simeq1$; $\mathrm{Re}(\sigma)$ becomes independent of the temperature, weakly dependent on B and the more heavily doped sample has the lower $\mathrm{Re}(\sigma)$ although the difference in $\mathrm{Re}(\sigma)$ is relatively small considering the differences in doping level and σ_{DC} of the two samples. (10 refs.)

67602 New results in transport phenomena in uncompensated n-type InSb with extremely low carrier density. A.Kadri, R.L.Aulombard, C.Bousquet, A.Raymond, J.L.Robert (CNRS, Univ. Sci. et Techniques du Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.235-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors report new experimental results of low temperature (4.2K-95K) transport phenomena in uncompensated n-type InSb sample, where very low free carrier concentrations are obtained using the properties of a metastable impurity state. By varying free electron density in the same sample, from 10^{11} cm^{-3} to 10^{14} cm^{-3} the metal-non metal transition is observed. The evidence of an activation energy of the hydrogenic level corresponding to the effective Rydberg is given. Above 40K the role of a donor-like impurity level is shown. (7 refs.)

67603 The activation energy of impurity conduction with sequentially correlated hopping. M.Ortuno, M.Pollak (Dept. of Phys., Univ. of California, Riverside, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.254-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors study the effects of correlations in successive jumps on the reduction of the activation energy ϵ_3 in impurity conduction at low concentrations. A mean field theory and a dielectric approach are used. They find that ϵ_3 is reduced by about 30% with respect to calculations without sequentially correlated hopping. The new value is in better agreement with the experimental results and with Monte Carlo calculations by Nguyen, et al. (1979). (10 refs.)

67604 Delocalization of H^--like impurity states and formation of band type impurity conductivity in semiconductors. E.M.Gershenson, A.P.Mel'nikov (Lenin State Pedagogical Inst., Moscow, USSR), V.N.Murzin, R.I.Rabinovich, I.E.Trofimov.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.257-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The data obtained represent the experimental evidence that the band impurity conductivity formation is determined by the delocalization of H^--impurity states in doped semiconductors. The paper reports the far IR photoconductivity and the magnetoresistance results, measured in doped and weakly compensated Si at different temperatures, electrical fields and impurity photoionization intensities. (9 refs.)

67605 Electrical and optical properties of black phosphorus single crystals. S.Narita (Dept. of Material Phys., Osaka Univ., Osaka, Japan), Y.Akahama, Y.Tsukiyama, K.Muro, S.Mori, S.Endo, M.Taniguchi, M.Seki, S.Suga, A.Mikuni, H.Kanzaki.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.422-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Large single crystals of black phosphorus have been prepared by a large volume-high pressure technique at high temperature. Using the crystals, the authors have measured temperature dependences of the electrical conductivity and the Hall coefficient, the FIR cyclotron resonance absorption and the reflectance for synchrotron radiation. All samples obtained are p-type and the Hall mobility reaches 5×10^4 cm^2/v.sec around 20K. The anisotropies of the effective mass, the Hall mobility and the SOR reflectance along the three crystal directions, a, b, and c, have been observed. (8 refs.)

67606 Hopping conduction of the bound magnetic polarons in n-CdMnSe. T.Dietl, J.Antoszewski, L.Swierkowski (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.491-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Low temperature measurements of resistivity as a function of magnetic field and for various net donor concentrations in $Cd_{0.95}Mn_{0.05}Se$ are reported. At low concentration results are in agreement with a model of the hopping of bound magnetic polarons if the thermodynamical fluctuations of magnetization are taken into account. At higher concentrations the magnetoresistance is larger than that expected from the theory. This suggests an onset of the correlated hopping. (7 refs.)

67607 Non-Ohmic conduction and weak localization in 1T-TaS$_2$. S.Uchida, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.673-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The electron localization in 1T-TaS$_2$ is studied by means of the non-Ohmic conduction which is observable below liquid N_2 temperature. It is found that an electric field has the effect of raising the electron temperature. The non-Ohmic conduction due to the electron heating mechanism is highly suggestive of the existence of weakly localized states in 1T-TaS$_2$. (11 refs.)

67608 Electronic transport in metallic Ge:Sb at very low temperature. Y.Ootuka, S.Kobayashi, W.Sasaki (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.700-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The electronic conductivity of metallic Ge:Sb below 1K is analyzed on the basis of recent theories of disordered metals. The temperature and magnetic field variation of conductivity is consistent with the theories. For the absolute value, the theory of localization overestimates, while that of interaction underestimates the effects. (8 refs.)

67609 Influence of impurities on the electrical properties of $Se_{65}Te_{35}$ glasses. P.Nagels, M.Ali, M.Rotti (Materials Sci. Dept., CEN, Mol, Belgium).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.989-91 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

A study of the influence of iodine in the electrical transport properties of $Se_{65}Te_{35}$ glasses is presented. The role played by iodine addition on some structure-sensitive properties as glass transition, crystallization and melting is also investigated by DSC measurements. The addition of iodine leads to an increase of the electrical conductivity and a decrease in the thermopower. In contrast to earlier work, in which n-type conduction in chlorine-doped Se was reported, the authors observe a positive thermopower in the pure and doped glasses. The results are discussed taking into account the possible interactions between the halogen and the chalcogen atoms. (3 refs.)

67610 Amorphous barium vanadates doped with transition metals. L.D.Bogomolova, S.N.Spasibkina (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.998-1000 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The EPR and Mossbauer spectra, static magnetic susceptibility and DC conductivity were measured in amorphous BaV_4O_{11} doped with Cr, Mn, Fe, Co, Ni and Cu impurities. The results are discussed in terms of the formation of associates between vanadium and the impurities. (5 refs.)

67611 The electrical conductivity of amorphous antimony and its dependence on film thickness. A.J.Mackintosh, R.T.Phillips, A.D.Yoffe (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1001-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Thin films of amorphous antimony have been prepared by thermal evaporation in high vacuum ($<10^{-7}$ mbar) onto sapphire substrates held at 77K. The electrical resistance of the films has been measured between 10K and 77K and shows $T^{-1/3}$ behaviour for 2-D ($<$200 Å) films, and $T^{-1/4}$ behaviour for 3-D films. Values of the localisation length (17 Å) and density of states at the Fermi level (1×10^{18} states/eV/cm^3) have been obtained from the thickness-dependence of the resistivity. These are found to be in good agreement with those obtained from high-field measurements on the same 3-D films (14-24 Å and 2.0-0.4$\times10^{18}$ states/eV/cm^3). (13 refs.)

67612 The DC conductivity of chalcogenide films due to the correlated barrier hopping mechanism. M.H.A.Pramanik, P.N.Butcher, I.D.Cox (Dept. of Phys., Univ. of Warwick, Coventry, England).

Philos. Mag. B (GB), vol.47, no.4, p.437-43 (April 1983).

Within the pair approximation, the correlated barrier hopping (CBH) mechanism apparently correlates the observed trends in the AC conductivities of chalcogenide films. Invoking an extended pair approximation, it is found that this mechanism is consistent in the case of wide band-gap materials in that it gives rise to an insignificant contribution to the observed DC conductivity which may then be correctly accounted for by invoking other processes. In the case of small band gap materials, however, this mechanism yields DC conductivities orders of magnitude larger than are observed. (15 refs.)

67613 Pressure and composition dependence of the electrical conductivity of iron-rich synthetic olivines to 200 kbar. A.Lacam (Inst. de Phys. du Globe, Univ. Paris, Paris, France).

Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.127-32 (1983).

The objectives of this study of olivines are to calibrate the variation of electrical conductivity with pressure up to 200 kbar in a diamond-anvil cell, and to determine how this is influenced by chemical composition. Experimentally, the author has found that the variation of the electrical conductivity of three synthetic olivines containing 50, 75 and 100 mole percent of fayalite, is an exponential function of pressure *P*, closely represented at room temperature by: $\sigma_{xP}=\sigma_x.\exp.(B_x.P)$ where x is the iron content of the olivine, σ_x the extrapolated value of conductivity at normal pressure and B_x the slope of the regression line in semi-logarithmic coordinates. It is thus possible to express the temperature dependence of conductivity through a Boltzmann relationship. On the other hand, σ_{xT} is an exponential function of x and thus, B_x and of course $V_x{}^*$ are linear functions. The experimental procedure is described and the results discussed. (23 refs.)

67614 Small-polaron hopping in magnetic semiconductors. D.Emin (Sandia Nat. Labs., Albuquerque, NM, USA), Nai Li Huang Liu.

Phys. Rev. B (USA), vol.27, no.8, p.4788-98 (15 April 1983).

The theory of small-polaron hopping transport in magnetic semiconductors and insulators is formulated via a many-electron generalization of the one-electron tight-binding approach utilized in standard small-polaron theory. Here the magnetic effects are taken into account from first principles by constructing the electronic wave function from linear combinations of antisymmetrized products of Wannier states involving both the itinerant electron and the valence electrons. This enables the authors to determine the effect of the indistinguishability of an itinerant electron from valence electrons on the transfer of an electron between two magnetic ions. To treat hopping within a magnetic lattice the magnetic environment surrounding the two sites directly involved in a hop is approximated by an effective internal magnetic field. It is found that in the paramagnetic and ferromagnetic regimes the magnetic nature of the solid only reduces the small-polaron mobility by a weakly temperatures-dependent factor of the order of unity. However, below the Neel temperature in an antiferromagnet it is found that electronic transitions only occur between nondegenerate states. This results in an additional activated factor in the small-polaron mobility. (18 refs.)

67615 Pressure effect on the resistance of InS. K.Takarabe, K.Wakamura, E.Ito (Dept. of Natural Sci., Okayama Univ. of Sci., Okayama, Japan).

Solid State Commun. (USA), vol.46, no.2, p.215-16 (April 1983).

The effect of pressure on the resistance of InS was studied to pressure higher than to 150 kbar for single crystal and to *ca.* 300 kbar for powdered samples. The resistance exhibits a sharp maximum at 47 kbar, which is explainable by the change of band structure due to pressure increase. Under higher pressure, the resistance decreased gradually with increasing pressure. A marked change in slope, however, was observed at 108 kbar, suggesting a phase transition possibly to a metallic phase. (9 refs.)

67616 Activated hopping mobility of carriers in magnetic semiconductors. E.L.Nagaev, A.I.Podel'shchikov.

Sov. Phys.-Solid State (USA), vol.24, no.10, p.1717-20 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3033-9 (Oct. 1982). [received: April 1983]

The state of a donor electron in a polarizable magnetic semiconductor was studied, together with the kinetics of hopping conduction via an impurity. Such a state combines the features of a localized Pekar polaron and a localized ferron. Because of the competition of various interactions, the electron radius in a paramagnetic crystal has a minimum as a function of temperature. In a partly compensated semiconductor, electron jumps from one donor atom to another become possible. As with small polarons, the movement of the lattice polarization together with the electron gives rise to a mobility activation energy. The mobility is very greatly reduced by the ferron effects, in comparison with a nonmagnetic semiconductor. Since these effects in paramagnetic and antiferromagnetic semiconductors decrease with increasing temperature, the effective activation energy of the mobility decreases also. (16 refs.)

67617 Aysmmetry of the electrical condictivity in pyroelectrics. B.I.Sturman (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.10, p.1742-5 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3079-84 (Oct. 1982). [received: April 1983]

It is shown that asymmetry of the periodic potential in pyroelectric crystals and also the presence of macroscopic asymmetric barriers to the charge carriers lead to a sharp asymmetry of the electrical conductivity, $j(E)\neq-j(-E)$. (10 refs.)

67618 Surface mobilities in laser-processed polysilicon films. R.C.Frye, K.K.Ng (Bell Labs., Murray Hill, NJ, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.275-86

Surface mobilities in laser-processed polysilicon films were measured using silicon-gate n-channel thin-film transistors of varying dimensions. The apparent surface mobility inferred from transconductance measurements was found to be a decreasing function of channel length. For very short ($\sim$0.3 μm) channels, this mobility approaches the surface mobility of identical devices fabricated on bulk silicon. Furthermore, the temperature dependence of the surface mobilities in polycrystalline and bulk films was found to be identical. A novel EBIC technique was employed to examine the surface potential of transistors in operation. These measurements indicate a high degree of spatial nonuniformity in the inversion layer of polycrystalline films arising from the grain boundary region. A simple model of the transistors is presented which explains the geometry dependent surface mobility and its temperature dependence. (30 refs.)

67619 Grain boundaries in crystallized silicon thin films. N.M.Johnson, D.K.Biegelsen, M.D.Moyer (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.287-96

The presence of residual grain boundaries in laser-crystallized thin films of silicon necessitates an understanding of their properties and effects on device operation. In CW laser crystallized silicon islands, lateral p-n junction diodes have been used to evaluate the following: (1) enhanced arsenic diffusion along grain boundaries, (2) current-voltage characteristics, and (3) effects of hydrogenation on diode operation. To study the process of hydrogen passivation, deuterium has been used as a readily identifiable isotope which duplicates hydrogen chemistry. From secondary-ion mass spectrometry, diffusion of deuterium in single-crystal and polycrystalline silicon at low temperatures (e.g. 350°C) clearly demonstrates that grain-boundary diffusion dominates bulk diffusion. 72.20H High-field and nonlinear effects

67620 Measurement of high electron drift velocity in a submicron, heavily doped graded gap $Al_xGa_{1-x}As$ layer. B.F.Levine, C.G.Bethea, W.T.Tsang, F.Capasso, K.K.Thornber, R.C.Fulton, D.A.Kleinman (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.769-71 (1 May 1983).
The authors have directly determined a high velocity ($\nu=1.8\times10^7$ cm/s) for electrons in a submicron (0.42 μm), strongly graded (quasifield $F=8.8$ keV/cm) highly doped ($p=4\times10^{18}$ cm^{-3}) $Al_xGa_{1-x}As$ layer. A transit time of only 1.7 ps was measured (an order of magnitude shorter than that for $F=1.2$ kV/cm). Such a structure would be ideal for the low resistance base of a high-speed *n-p-n* transistor. (23 refs.)

67621 High energy diffusion equation for polar semiconductors. J.P.Leburton, K.Hess (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.211-13 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors present a novel method to explicitly solve the Boltzmann equation for highly energetic electrons interacting with polar optical phonons and scattering mainly in forward direction. The approach reduces the collision integral of the Boltzmann equation into a differential operator which is much easier to manipulate than the integral form and does not require a relaxation time approximation. The spatial diffusion of highly energetic electrons is calculated and discussed in context with high speed velocity transients ('ballistic transport'). Explicit results compare favorably with sophisticated Monte Carlo simulations and are well suited to treat complex transport problems in submicron III-V devices. As an example they calculate the current voltage characteristic of a 'camel-back diode'. (8 refs.)

67622 Direct evidence for screening of carrier-acoustic phonon interaction at low to medium carrier densities in GaAs. H.Munzel (Inst. fur Halbleitertech., RWTH Aachen, Aachen, Germany), D.Bimberg, A.Steckenborn.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.214-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Direct evidence for screening of the electron (and hole)-piezoelectric acoustic phonon interaction in GaAs even at low to medium carrier densities (10^{13}-10^{16} cm^{-3}) is reported and indications for a partial screening of the carrier-deformation potential interaction are discussed. These conclusions are based on detailed experimental determinations of the dependence of energy dissipation rates of hot carriers on carrier and lattice temperature under steady state conditions and free decay of a hot gas. Diffusion loss mechanisms govern the energy transfer of a hot carrier plasma to the lattice in steady state and in the transient case. Hole-deformation potential scattering and electron-deformation potential scattering, respectively, are the dominant processes in contrast to previous belief. The dissipation rate is more than one order of magnitude larger under continuous excitation. (9 refs.)

67623 Field dependent scattering and hot electron kinetics. D.C.Herbert, S.J.Till (Royal Signals & Radar Establ., Malvern, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.217-19 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A new hot electron kinetic equation based on the use of real space Airy functions is discussed. The electron-phonon scattering vertex in the Airy function basis is localised in real space, and when the resonant width extends to the band tail region, a field dependent suppression of scattering at low kinetic energy results. The kinetic equation is only equivalent to the Boltzmann equation for homogeneous situations, when the field dependence of the scattering is neglected. A variational technique for solving the kinetic equation has been developed which allows very rapid numerical evaluation and consequently should assist in studying more complex phenomena in very small devices, or devices operating at very high electric fields. (7 refs.)

67624 Transport phenomena of hot holes anomalously distributed in a warped energy band of silicon. K.Kajita (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.223-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Hot hole effects of low density heavy holes in silicon are investigated. Anomalous transport phenomena such as negative Hall effects are interpreted in terms of the 'streaming' and the 'accumulation' of heavy holes in the warped energy band. (6 refs.)

67625 An approach to non-stationary hot electron transport by the Langevin equation method. N.Pottier (Ecole Normale Superieure, CNRS, Univ. Paris VII, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.241-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A new method of treating the non-stationary high-field electron transport in semiconductors is presented: the two dynamically coupled systems of electrons and phonons in the presence of a high $\vec{E}$-field are studied in a Heisenberg picture, and a Langevin equation for the relevant electron operators is derived microscopically for the first time in this case. The two-time correlation function of the Langevin force is calculated and a non-stationary electric-field-dependent velocity diffusion coefficient is defined. This coefficient can be related to the collision term of the master equation for the electron density matrix, which constitutes a generalization of the fluctuation-dissipation theorem to this non-stationary and non-linear situation. (9 refs.)

67626 Theory of relaxation of hot electrons and oscillatory photoconductivity in polar semiconductors. R.Evrard, Ph.Lambin, J.Schmit (Inst. de Phys., Univ. de Liege, Liege, Belgium).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.247-50 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The Boltzmann equation is solved for the relaxation of out-of-equilibrium electrons due to optical and acoustical phonons. The first stage of the relaxation, governed by the optical phonons, is quite fast and leads to a non Maxwellian distribution. The acoustical phonons are responsible for the second stage of the relaxation, much slower and leading to a Maxwellian distribution. Comparison is made with the experimental results for GaAs. The stationary situation encountered in the study of the oscillatory photoconductivity and photoluminescence is also studied. It is shown that the electron population has an oscillatory behaviour versus the energy at which they are photo-injected. (8 refs.)

67627 Impact ionization probability and photo quantum efficiency in InSb. J.T.Devreese (Eindhoven Univ. of Technol, Eindhoven, Netherlands), R.G.van Welzenis, R.P.Evrard.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.435-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A method to calculate the photo-quantum efficiency in polar semiconductors by solving the Boltzmann equation is used to estimate the probability per unit time for impact ionization in InSb at 90K. Several simplifying assumptions (e.g. regarding the bandstructure of InSb) are made but they do not limit the generality of the method. (5 refs.)

67628 Spin-hot electrons in photoexcited p-type InSb. K.Fujii, T.Ohyama, E.Otsuka (Dept. of Phys., Osaka Univ., Osaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.502-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Electron cyclotron resonance has been distinctly observed for the first time in p-type InSb by pulsed intrinsic photoexcitation. Investigation by means of time resolution leads to the confirmation of an 'optical hot electron' system. Temperature of this system rises up to 60K for strong excitation and its time constant of cooling is as long as several microseconds at the lattice temperature of 4.2K. A crude calculation for spin flipping between 0^- and 0^+ Landau subbands is in good agreement with the apparent cooling process, showing the slow energy relaxation to be interpreted in terms of spin relaxation. (9 refs.)

67629 Phase transition and chaos in electrical avalanche breakdown caused by weak photoexcitation at 4.2K in n-GaAs. K.Aoki, K.Miyamae, T.Kobayashi, K.Yamamoto (Dept. of Electrical & Electronic Engng., Kobe Univ., Kobe, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.570-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Periodic oscillations and turbulence in connection with electrical avalanche breakdown have been observed in high-purity n-GaAs at 4.2K, using a pulse voltage of ~4 V/cm and with weak photoexcitation around the band-gap energy. The oscillatory behavior follows the chaotic regime in the fluid flow system, and gives a first example of the onset of chaos which originates in a new type of phase transition in semiconductors. (5 refs.)

67630 Non-linear conductivity of monoclinic TaS_3. K.Hasegawa, A.Maeda, S.Uchida, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.599-601 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Strongly non-ohmic conduction is observed in the semiconducting charge-density-wave (CDW) state of monoclinic TaS_3 above a very sharp threshold field. These features could be interpreted in terms of depinning or tunneling of pinned CDW under an applied electric field. Large noise appears with the onset of the non-linear conductivity and fades away as the current through the samples is increased, which because as a decreasing function of frequency. (12 refs.)

67631 Transition rate for impact ionization in the approximation of a parabolic band structure. J.Geist, W.K.Gladden (Radiometric Phys. Div., NRS, Washington, DC, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4833-40 (15 April 1983).
Recently, Alig, Bloom, and Struck (1980) have reported a simple model of ionization scattering in semiconductors and insulators. Their model is based upon the random-k approximation to the transition rate for impact ionization, and upon a generic band structure with only two free parameters to describe all materials. The present paper describes the first step in an attempt to understand in detail why such a simple model works so well. The random-k approximation to the transition rate for impact ionization is tested on a highly symmetric band-structure model for which most of the dimensions of the twelve-dimensional transition-rate integral can be treated analytically. The difference near threshold between the random-k approximation and the rigorous result can be much larger than indicated by Kane's (1976) Monte Carlo integration for the silicon band structure, but this difference seems to be unimportant in practical problems where impact ionization competes with phonon emission. (4 refs.)

67632 Combined breakdown in bismuth-antimony semiconductor alloys. E.V.Bogdanov, V.V.Vladimirov, V.N.Gorshkov (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Solid State Commun. (USA), vol.46, no.2, p.193-6 (April 1983).
S-shaped current-voltage characteristics for $Bi_{1-x}Sb_x$ alloys are studied theoretically and experimentally. The phenomenon is shown to occur due to the combined interband breakdown, the impact ionization being caused both by the external electric field and the Hall field. The latter is governed by the proper magnetic field of the plasma current. The negative differential resistance (NDR) occurs for the range of currents where the impact ionization is growing intensively but the pinch effect is not yet developed to full extent. The phenomenon is enhanced if the impact ionization rate in the Hall field is greater than in the applied one. (11 refs.)

67633 Relaxation currents in amorphous tantalum oxide in intense electric fields. V.V.Bryksin, M.N.D'yakonov, V.M.Muzhdaba, S.D.Khanin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1520-2 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2682-5 (Sept. 1982). [received: April 1983]
The time dependence of the conductivity of amorphous tantalum oxide in intense electric fields is investigated. The hopping mechanisms of charge transfer is confirmed and an increase in the characteristic dimension of the cluster of states is observed experimentally. The critical hopping probability is determined. (11 refs.)

67634 Thermal phonon bottleneck and nonlinear current-voltage characteristics of conducting media. A.I.Vasker, Yu.G.Gurevich (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1698-700 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3000-3 (Oct. 1982). [received: April 1983]
The self-consistent process of heat transfer from a nonequilibrium (due to an applied heating electric field) conducting medium to an external thermostat (cryogenic liquid) is considered. Conditions are obtained for which ineffective cooling of a sample (phonon bottleneck in the heat transfer) is a mechanism for the formation of negative differential conductivity in solids. 72.20J Charge carriers: generation, recombination, lifetime, and trapping

67635 Polaron nature of charge carriers in silver azide. V.C.Kriger (Kemerovo State Univ., Kemerovo, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.805-8 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.960-3 (June 1982). [received: Feb. 1983]
It was found that if polaron effects are taken into account in silver azide it is possible to explain the regularities of electron-hole transfer and estimate the effective masses of carriers, their mobilities, and the energetic positions of defect levels in the forbidden band. It was shown that the holes may be localised in pairs on point and macrodefects. This must be taken into account when working out a mechanism of decomposition of azides. (18 refs.)

67636 Effects of interface-potential nonuniformities on carrier transport across silicon grain boundaries. D.J.Thomson, H.C.Card (Dept. of Electrical Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
J. Appl. Phys. (USA), vol.54, no.4, p.1976-80 (April 1983).
In an experimental investigation of electronic transport across individual grain boundaries in cast silicon, the authors have recently arrived at the conclusion that the diffusion potential at the grain boundary may in many cases exhibit appreciable variation over the boundary plane. The present paper describes an interpretation of the experimental observations in terms of a Gaussian distribution of interface potential over the grain-boundary surface, and a majority carrier transport to the boundary which is diffusion limited. In the grain boundaries studied the mean value of the diffusion potential was found to vary from $\langle V_d \rangle \simeq 0.70$ to $\langle V_d \rangle \simeq 0.32$ eV and the standard deviation from $\sigma \simeq 0$ to $\sigma \simeq 0.11$ eV. These values were derived from the change in activation energy with temperature. For the particular grain boundaries with spatial uniformity ($\sigma \simeq 0$) excellent agreement of the characteristics with an emission/diffusion model of majority-carrier transport is obtained. It is concluded (i) that it is not generally proper to assume that grain boundaries in cast silicon are spatially uniform and (ii) that the Gaussian distribution model provides a satisfactory first approximation to the spatial variation in grain boundaries. (10 refs.)

67637 Mechanism for relaxation of the phase of the electron wave function in *n*-type GaAs. O.V.Emel'yanenko, T.S.Lagunova, T.A.Polyanskaya (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.246-9 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.199-201 (20 Sept. 1982). [received: April 1983]
The phase relaxation time is estimated from the magnetic field dependences of the conductivity at liquid helium temperatures. It is shown that the phase relaxation time is determined by the electron-phonon collisions and the lifetime of single-particle excitations under conditions with short mean free paths. (9 refs.)

67638 TSC study of morphological modifications of rhodamine coloured PMMA. A.Chafai, D.Chatain, J.Dugas, C.Lacabanne (Lab. de Phys. des Solides, Univ. Paul Sabatier, Toulouse, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.335-8 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Rhodamine colored PMMA samples that may be used for solar collectors, have been studied by the thermostimulated currents technique. The comparison with pure PMMA data shows that the presence of rhodamine produces a thermostimulated peak at about 125°C. The analysis of its fine structure reveals the existence of relaxation modes characterized by relaxation times obeying a compensation law with a compensation temperature independent on the dye concentration. This phenomenon might be attributed to a morphological change of PMMA assigned to the rhodamine thermal degradation. (6 refs.)

67639 Harmonic generation due to ballistic electron transport in GaAs. D.Raychaudhuri, D.Chattopadhyay (Inst. of Radio Phys. & Electronics, Univ. of Calcutta, Calcutta, India).
Proc. IEEE (USA), vol.71, no.3, p.440-1 (March 1983).
Harmonics produced by the nonlinearity in the current-voltage characteristics of a ballistic diode are studied for a GaAs sample of thickness 1 μm at 77K under collision-free condition. Harmonic generation is found to be maximum at zero bias, the value for the second-harmonic current being 50 percent for a signal amplitude of 0.2 V. (2 refs.)

67640 Ultrafast relaxations of photogenerated carriers in amorphous semiconductors. J.Tauc (Dept. of Phys., Brown Univ., Providence, RI, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.889-93 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Electron relaxation effects in the range from 0.5 to 200 ps were studied in amorphous silicon and chalcogenide glasses using the pump and probe technique. Information about hot carrier thermalization and carrier trapping in shallow and deep states in the gap was obtained. (12 refs.)

67641 Carrier dynamics in optically illuminated a-Si:H. Y.Aoygi (Inst. of Phys. & Chem. Res., Saitama, Japan), S.Kumuro, Y.Segawa, S.Namba, H.Okamoto, Y.Hamakawa.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.894-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
It is found that in glow discharge a-Si:H the diffusion coefficient and the lifetime of the photo-excited carriers at the surface largely differ from those in the bulk, and the lifetime at the surface decreases drastically after the optical illumination. It is also found that a picosecond time relaxation of photo-excited carriers at the surface appears after an optical illumination in a-Si:H. The experimental results were explained by a multiple trapping mechanism taking account of the shallow and deep localized states increased after the optical illumination. (7 refs.)

67642 Distribution of recombination lifetimes in doped a-Si:H. D.K.Biegelsen, R.A.Street, W.B.Jackson (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.899-901 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Transient decay measurements of light-induced ESR are used to probe the distribution of recombination lifetimes in a-Si:H. The lifetimes are related to the densities of defect and band tail states at the quasi Fermi levels. (8 refs.)

67643 Kinetics of distant-pair recombination: application to amorphous silicon. D.J.Dunstan (Angewandte Phys., Johannes Kepler Univ., Linz, Austria).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.902-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The author presents an exact solution for the decay of randomly distributed excited carriers, and find that a monomolecular, distant-pair approximation is valid over a wide range of excitation powers. Under repetitively pulsed or continuous excitation, an accumulated pair population is present, the result of which is that the decay curve varies at high excitation power but is independent of excitation power at low power. In consequence, time-resolved experiments cannot distinguish between distant-pair and germinate recombination, and frequency-resolved methods must be used. He finds that distant-pair recombination provides a quantitative explanation of the experimental results in a-Si:H. (16 refs.)

67644 Electron-hole-pair generation and hysteresis in semiconductors. A.Elci, M.O.Schully (Max-Planck-Inst. fur Quantenoptik, Garching, Munchen, Germany), J.M.O'Hare.
Phys. Rev. B (USA), vol.27, no.8, p.4779-87 (15 April 1983).
The authors consider the electron-hole-pair generation and the resulting free-carrier-density buildup in a semiconductor irradiated with laser beams whose frequencies are below the band gap. Using a simple model, they show that the free-carrier density may exhibit hysteresis and that when placed in a cavity, the semiconductor causes optical multistability at relatively low input CW intensities. For InSb the model predicts hysteresis at or above ~ 100 W/cm^2. (9 refs.)

67645 Energy dependence of the carrier mobility-lifetime product in hydrogenated amorphous silicon. W.B.Jackson, R.J.Nemanich (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), N.M.Amer.
Phys. Rev. B (USA), vol.27, no.8, p.4861-71 (15 April 1983).
The results of optical-absorption measurements determined by photothermal deflection spectroscopy, primary photoconductivity, and secondary photoconductivity on undoped and phosphorus-doped hydrogenated amorphous silicon films (*a*-Si:H) are reported. A normalization procedure for obtaining photocurrent spectra at constant generation rate is demonstrated. From these measurements, the efficiency-mobility-lifetime product ($\eta\mu\tau$) for electrons is found to be constant from 2.0 to ~ 0.9 eV for both undoped and phosphorus-doped *a*-Si:H. For excitations less than ~ 0.9 eV, there is evidence that the product $\eta\mu\tau$ for electrons drops rapidly; similarly, the $\eta\mu\tau$ for holes exhibits a rapid decrease in undoped material for photon energies less than ~ 1.5 eV. A model is proposed to explain the results, resolving a discrepancy between secondary- and primary-photoconductivity measurements of the optical absorption. (27 refs.)

67646 Electron beam induced conductivity in 'PET' and 'FEP'. S.J.Walzade, J.P.Jog, S.B.Dake, S.V.Bhoraskar (Dept. of Phys., Univ. of Poona, Pune, India).
Solid State Commun. (USA), vol.46, no.5, p.393-6 (May 1983).
Electron Beam Induced Conductivity (EBIC), classified into EBIC (bulk) and EBIC (surface) have been measured in PET and FEP respectively. The peculiar oscillatory nature of the induced gain versus beam energy variations is explained in terms of spatial distributions of the trapping centres near the surface of the polymers. (11 refs.)

67647 Distribution of the intensity of recombination waves in a bounded semiconductor under transient conditions. I.V.Karpova, V.A.Sablikov, S.M.Syrovegin (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1267-71 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1963-8 (Nov. 1982). [received: April 1983]
An active region in the form of a sharp maximum of the time-average value of the electric field forms in a semiconductor under conditions favoring excitation of recombination waves. Theoretical and experimental investigations are reported of the process of formation of such an active region during the transient stage following the application of a voltage pulse which excites low-amplitude recombination waves. It is shown that even during this initial stage of the development of an instability the intensity of recombination waves has a maximum at that point in a sample where an active region forms subsequently. Other arguments are adduced to show that the active region is due to recombination waves themselves and represents one of the nonlinear effects that accompany the growth of such waves. (10 refs.)

67648 Validity of the effective lifetime concept in polycrystalline silicon. S.C.Jain (Solidstate Phys. Lab., Delhi, India), R.Janssens, G.Cheek, P.DePauw, R.Mertens, R.van Overstraeten.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.432-6
Polycrystalline silicon currently has much technological importance for potential photovoltaic applications. In the paper the effective lifetime concept of minority carriers, often used for solar cell calculations, is examined. The effective grain boundary surface recombination velocity, S_{eff}^{GB}, is not linear in n, the minority carrier concentration. The problem can be made linear if S_{eff}^{GB} is very large such that the diffusion current to the grain boundary is limited by the diffusion velocity. However, in general a large S_{eff}^{GB} makes the series $n(x,y,z)=\Sigma\ \Sigma\ n_{i,j}(x,y,z)$ slowly convergent and the cell cannot be described by one τ_{eff}. It is found that for calculating Isc, the concept of τ_{eff} works as a special case. The error in the calculation of the dark saturation current becomes larger, the principle of superposition becomes invalid and Voc cannot be calculated using the concept of τ_{eff}. (6 refs.)

72.20M Galvanomagnetic and other magnetotransport effects

67649 Quantized Hall conductance: effect of random potentials. W.Brenig (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Z. Phys. B (Germany), vol.50, no.4, p.305-9 (1983).
The effect of random potentials on the Hall current is expressed in terms of a sum of level shift functions $\eta(\epsilon)$. These functions obey a generalized Levinson theorem: $\eta(\bar{\epsilon})$-$\eta(\underline{\epsilon})=\pi N_b=$number of localized states where $\bar{\epsilon}$ and $\underline{\epsilon}$ are the upper and lower mobility edge respectively of a band of extended states. As a consequence of that the total Hall current carried by a band of extended states originating from a Landau level remains unaffected by a random potential independent of the number of bound states split off from the continuum. (10 refs.)

67650 Low-field galvanomagnetic tensor components for electrons in bismuth. M.M.Krishna (Cryogenics Section, Nat. Phys. Lab., New Delhi, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.930-7 (Dec. 1982). [received: April 1983]
Azbel-Kaner cyclotron resonance and magnetic field induced surface state resonance show that the law of dispersion for electrons in bismuth follows the Cohen's model $(E-p_2{}^2/2m_2)(1+E/E_g+p_2{}^2/2m'_2E_g)=p_1{}^2/2m_1+p_3{}^2/2m_3$ with ellipticity parameter $p=m_2/m_2' \neq 1$. The results for twelve weak field galvanomagnetic tensors are presented for electrons in bismuth using Cohen's multivalley model and anisotropic scattering time. The three valleys are situated at the L-point of the Brillouin zone and separated from each other by ±120° rotation about the trigonal axis. Special cases of the author's results show that earlier calculations of galvanomagnetic tensors for a parabolic model ($E_g \rightarrow \infty$ in Cohen's model) by Freedman and Jurestschke [Phys. Rev. (USA), vol.124, p.1379, 1961] contain an error in tensor component σ_{2323} and Cohen's model with $p=1$ by V.S. Voloshin [Sov. Phys.-Solid State (USA), vol.13, p.899, 1971] contains error in L_4 and σ_{2323}. (11 refs.)

67651 Saturation of Si activation at high doping levels in GaAs. T.C.Banwell, M.Maenpaa, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA), J.L.Tandon.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.507-14 (1983).
Ion implantation of Si is extensively employed in the fabrication of GaAs integrated circuits as an *n*-type dopant. The authors have investigated the electrical activation of Si in GaAs with high dose (10^{17}-10^{19} cm^{-3}) room temperature Si implantations in semi-insulating GaAs. A co-implantation of As with Si was used to study the influence of local stoichiometry and substrate morphology on the electrical activation of Si. A van der Pauw method was employed for electrical characterisation. The results show that the previously reported saturation in the free electron concentration at 2×10^{18} cm^{-3} is not altered by coimplanted As. The authors compile their results with those of several publications to obtain the electrical activation after $\sim 850°$C annealing for implanted Si in the concentration range 10^{16}-10^{20} Si cm^{-3}. A quantitative description of the saturation effect is presented and discussed in terms of a simple saturation mechanism. (24 refs.)

67652 On the conduction band anisotropy in semimagnetic semiconducting $(Cd_{1-x}Mn_x)_3As_2$ alloys. F.A.P.Blom, J.J.Neve, P.A.M.Nouwens (Dept. of Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.470-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Shubnikov-de Haas (SdH) measurements have been carried out on $(Cd_{1-x}Mn_x)_3As_2$ alloys with low Mn contents. The anisotropy in the SdH oscillation periods can be explained by a warped Bodnar type Fermi surface. The angular dependence of the electronic effective g-factor is not as strong as has been predicted by theory. (9 refs.)

67653 Magnetoresistance of the 2-D impurity band in silicon inversion layers. A.Hartstein, A.B.Fowler (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), K.C.Woo.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.655-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The effect of a magnetic field perpendicular to the surface on the conductance of the two-dimensional (2-D) Na^+ induced impurity band in silicon inversion layers has been studied. The temperature dependence of the conductance at low fields (H<5 T) is $\sigma=\sigma_0\exp\text{-}(T_0/T)^{1/3}$, which is expected for variable range hopping in 2-D when the impurity wave functions are hydrogenic. At higher fields (H>10 T), $\sigma=\sigma_0'\exp\text{-}(T_0'/T)^{1/2}$, which should result for Landau (Gaussian) impurity wave functions. In this high field regime the authors observe $T_0'=aH$, where a depends only on the density of states at the Fermi level and fundamental constants. (9 refs.)

67654 High electric field effect on negative magnetoresistance in Si (001) n-inversion layers. Y.Kawaguchi (Gakushuin Women's Junior Coll., Tokyo, Japan), S.Kawaji.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.658-60 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Electric field (E_{SD}) dependence of negative magnetoresistance in silicon (001) MOS inversion layers has been measured at the field from 0.4 V/m to 1000 V/m at 1.1K and 4.2K. The E_{SD} dependence of the negative magnetoresistance is explained by E_{SD} dependence of inelastic scattering time of electrons due to the change in electron temperature by the field. Energy transfer of electrons to the lattice is well explained by the surface scattering theory with the bulk value of deformation potential constant for the $Si\text{-}SiO_2$ interface. (6 refs.)

67655 Magnetoresistance in weakly localized regime. H.Fukuyama (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.676-81 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A review is given on the recent microscopic investigation of the magnetoresistance in the weakly localized regime of semiconductors both in two and three dimensions. Agreement between theory and experiment on Si-MOS and doped semiconductors is seen to be satisfactory. (49 refs.)

67656 The quantum Hall effect. K.V.Klitzing, G.Ebert (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.682-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Hall effect measurements on a two-dimensional electron gas, realized with different types of semiconductor devices, show that the Hall conductivity at low temperatures and high magnetic fields becomes quantized in units of e^2/h. This quantity has been measured with an uncertainty of less than 10^{-6} and agrees with the officially recommended value. This result has initiated a large number of publications which discuss the question of why the measured value for the Hall conductivity is not significantly influenced by microscopic details of the semiconductor. (25 refs.)

67657 Observation of quantized Hall effect and vanishing resistance at fractional Landau level occupation. H.L.Stormer (Bell Labs., Murray Hill, NJ, USA), D.C.Tsui, A.C.Gossard, J.C.M.Hwang.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.688-90 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Quantization of the Hall resistance ρ_{xy} and the approach of a zero-resistance state in ρ_{xx} are observed at fractional filling of Landau levels in the magnetotransport of the two-dimensional electrons in GaAs-(AlGa)As heterostructures. At the lowest temperatures (T~0.5K), the Hall resistance is quantized to values $\rho_{xy}=h/(1/3\ e^2)$ and $\rho_{xy}=h/(2/3\ e^2)$. This observation, unexpected from current theoretical models for the quantized Hall effect, suggests the formation of a new electronic state at fractional level occupation. (13 refs.)

67658 Electron localization and the quantized Hall resistance in silicon inversion layers. J.Wakabayashi (Cavendish Lab., Univ. of Cambridge, Cambridge, England), H.W.Myron, M.Pepper.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.691-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Investigates the formation of the plateau of quantized Hall resistance in the spin split minimum and the lowest valley split minimum of the ground Landau level of (100) Si inversion layers. The results in the spin gap are explained by a model based on Anderson localization in strong magnetic fields and on the existence of long range potential fluctuations. The behaviour of ρ_{xy} in the second, spin up, higher valley, level is discussed in relation to the compensation effect suggested in recent theories. Application of a field of 25 Tesla resulted in the delocalization of electrons in the lowest valley level and the appearance of the plateau of quantized Hall resistance in the lowest valley gap. (18 refs.)

67659 Threshold scattering of conduction electrons by magnetic impurities in semimagnetic semiconductors subjected to a strong magnetic field. I.I.Lyapilin (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1253-6 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1942-6 (Nov. 1982). [received: April 1983]
It is shown that the overlap of the conduction and valence bands which appears in semimagnetic semiconductors with suitable values of the parameters N, H, and T (N is the concentration of a transition element, H is a magnetic field, and T is the absolute temperature) gives rise to a new channel for the scattering of conduction electrons which involves electron transitions from the conduction to the valence band. This scattering mechanism has threshold and it gives rise to a nonmonotonic dependence of the resistance on the magnetic field at a fixed temperature. (11 refs.)

67660 Investigation of the Hall effect in liquid gallium antimonide near the melting point. V.M.Glazov, V.B.Kol'tsov, S.Gaforov (Inst. of Electronic Technol., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1265-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1959-62 (Nov. 1982). [received: April 1983]
The Hall effect in liquid gallium antimonide near the melting point was investigated for the first time. Beginning from the melting point it was found that the temperature dependence of the Hall coefficient could be explained by the concept of aftermelting on the basis of a cluster model used to estimate quantitatively the magnitude of the effect. Estimates were obtained of an abrupt change in the carrier density at the melting point of gallium antimonide, which confirmed completely the metallic nature of the melt of this compound. The results obtained were used to calculate the electron component of the entropy of fusion of gallium antimonide, which agreed well with earlier model calculations. (17 refs.)

67661 Localized magnetic moments in $Bi_{1-x}Sb_x$ semiconductor alloys. A.A.Zhukov, V.G.Karavaev, A.A.Kudryashov, L.Skrberk, S.M.Chudinov (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1678-82 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2963-71 (Oct. 1982). [received: April 1983]
Galvanomagnetic effects in single crystals of $Bi_{1-x}Sb_x$ $(0.075\leq x\leq 0.18)$ *n*-type semiconductor alloys with carrier impurity densities $n=(2.10^{13}-3.10^{15})$ cm^{-3} (the doping impurities are not magnetic) are investigated. The investigation were carried out in magnetic fields up to 65 kOe in the temperature range $0.02K\leq T\leq 200K$. The temperature dependence of the resistance in the temperature range (1.5-8)K has a logarithmic form. When $T<1K$, after a quite wide maximum, a reduction in the resistance as the temperature falls is observed. The dependence of ρ on T in the range (0.2-0.6)K is linear, and when $T\sim(0.1\text{-}0.2)K$ it becomes quadratic. A negative magnetoresistance and an anomalous Hall effect was observed in the alloys investigated. These anomalies in the temperature dependence of the galvanomagnetic coefficients can be understood by assuming that localized magnetic moments exist in these alloys. Possible mechanisms by which these magnetic moments are formed are discussed. (18 refs.)

72.20N Thermomagnetic effects

67662 **Two thermomagnetic effects and the electronic thermal conductivity in *p*-GaSb.** S.K.Patapis (Dept. of Phys., Univ. of Athens, Athens, Greece).
Solid State Commun. (USA), vol.46, no.7, p.527-9 (May 1983).
Two thermomagnetic effects are studied in single crystal p-GaSb. The influence of a weak magnetic field, up to 20 kG, upon the thermoelectric effect and the thermal conductivity of the semiconductor for different temperatures is investigated. From the measurement of the change of the above transport properties in a magnetic field, conclusions concerning their field and temperature dependence, the *r* (exponent in scattering law) and the electron components of the thermal conductivity and their dependence on temperature have been derived. (13 refs.)

72.20P Thermoelectric effects

67663 **Nonlinear *I-V* behaviour and thermo-EMF in amorphous semiconducting selenium-tellurium alloys.** J.K.Zope (Dept. of Phys., Shivaji Univ., Kolhapur, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.774-6 (Oct. 1982). [received: April 1983]
Amorphous semiconducting compounds of the composition $Se_{20}Te_{80}$, $Se_{15}Sb_5Te_{80}$ and $Se_{10}Sb_{10}Te_{80}$ are studied for their *I-V* characteristics and thermoelectric power. It has been observed that the nonlinear *I-V* behaviour for the on-state is a function of the presence of antimony in the sample. The On-state voltage shifts to lower voltage value as antimony increases in the sample. The material becomes conducting due to the presence of antimony. All the samples are of *p*-type in nature. The thermoelectric power decreases when the quantity of antimony increases in the samples. The nonlinear *I-V* behaviour, the *p*-type nature and the decrease of *Q* when antimony is present in the sample, are discussed on the basis of the charged defect states existing in the material. Higher content of antimony in the samples shows a metallic nature and the *I-V* curve is linear. (15 refs.)

67664 **The thermoelectric power of TaS_3.** B.Fisher (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Solid State Commun. (USA), vol.46, no.3, p.227-8 (April 1983).
The thermoelectric power of TaS_3 filaments was measured as a function of temperature between 90-400K. Its positive sign in the whole temperature range and its linear dependence on reciprocal temperature between 120-200K are discussed in connection with the temperature dependence of the resistance. (6 refs.)

67665 **Thermoelectric characteristics of anisotropic thermoelements made of elastically deformed *n*-type silicon crystals.** P.I.Baranskii, E.N.Vidalko, V.V.Savyak (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1300-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2015-17 (Nov. 1982). [received: April 1983]
An investigation was made of the thermoelectric power, piezothermoelectric power, and thermoelectric figure of merit of undeformed and uniaxially deformed *n*-type Si crystals at $T=85$K with electron densities in the range $1.9\times10^{13}\le n_e\le 2.6\times10^{16}$ cm^{-3}. It was found that, in spite of the high thermal conductivity which increased in the case of *n*-type Si as a result of cooling, these crystals could exhibit (in an elastically deformed state) a thermoelectric figure of merit comparable with that of the most widely used thermoelectric materials. The anisotropy of the thermoelectric power (governing the sensitivity of an anisotropic thermoelement) of uniaxially deformed *n*-type Si exceeded the anisotropy of commonly used thermoelectric materials by two orders of magnitude. (11 refs.)

67666 **Magnetophonon oscillation of thermoelectric power—anomalous behaviour in p-type-to-intrinsic transition region of InSb.** K.Takita.
Solid State Phys. (Japan), vol.17, no.12, p.717-23 (Dec. 1982). In Japanese. [received: April 1983]
Amplitude enhancement and abrupt phase-shift of magnetophonon oscillation of thermoelectric power are interpreted as arising from enhanced electron diffusion, which is induced by rapidly increasing the electron concentration in the p-type-to-intrinsic transition region. (11 refs.)

67667 **Thermo-EMF of cells with a $ZrO_2+Y_2O_3$ electrolyte in atmospheres of different compositions.** G.I.Fadeev, M.V.Perfil'ev (Inst. of Electrochem., Acad. of Sci., Sverdlovsk, USSR).
Sov. Electrochem. (USA), vol.18, no.7, p.894-7 (July 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.7, p.1004-6 (July 1982). [received: March 1983]
The theoretical question of the thermo-EMF of cells with a solid oxide electrolyte based on zirconium dioxide has been considered previously. The experimental results available at the present time relate to the electrolytes ZrO_2+CaO, $ZrO_2+Sc_2O_3$, and $ZrO_2+Y_2O_3$. The thermo-emf measurements were carried out in an atmosphere of inert gas$+O_2$ at temperatures of 800-1200°C. The results of the measurements agree well with theory. In the paper the authors give the results of measurements of the coefficient of the thermo-emf in mixtures of gases: in inert gas$+O_2$, $CO+CO_2$, and H_2+H_2O in the temperature range of 400-900°C, and these results are compared with the theoretical calculations. (8 refs.)

67668 **The preparation of fine grained thermoelectric alloys by vacuum hot pressing.** D.M.Rowe (Dept. of Phys., Electronics & Electrical Engng., Univ. of Wales Inst. of Sci. & Technol., Cardiff, Wales).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.487-95
N-type silicon germanium alloy compacts of the composition $Si_{63.5}$ $Ge_{36.5}$ and with a grain size (L) in the range $10<L<25$ μm, $5<L<10$ μm and <5 μm have been prepared by vacuum hot press sintering at temperatures close to the alloy solidus temperature (1200°C) and at pressures of $\sim$200 MPa. The compacts were better than 98% dense compared to equivalent single crystal material and little if any grain growth has occurred. Initial measurements of the thermoelectric transport properties confirm the theoretical prediction that the lattice thermal conductivity decreases with a reduction in grain size. At room temperature the lattice thermal conductivity of the 'single crystal' starting material is equal to 4.31 W m^{-1} K^{-1} and falls to 3.10 W m^{-1} K^{-1} in the compact with a grain size <5 μm, a reduction of $\sim$28%. Within experimental error the Seebeck coefficient and electrical resistivity do not change with a reduction in grain size. It is concluded that the thermoelectric conversion efficiency of the alloy would be significantly improved through the use of fine-grained material. (18 refs.)

72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

67669 **Giant quantum oscillations of the non-local damping of coupled helicon-phonon modes.** R.Idiculla, K.S.Viswanathan (Dept. of Phys., Univ. of Kerala, Trivandrum, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.808-11 (Oct. 1982). [received: April 1983]
A numerical study has been made of the nonlocal damping of coupled helicon-phonon modes for the case when quantum effects are significant. It is found that the phonon damping also undergoes giant quantum oscillations in the interaction region. The results confirm the mode conversions that take place due to interaction and the hybrid nature of the coupled modes. (4 refs.)

67670 **Relaxation kinetics in polar semiconductors.** A.J.C.Sampaio (Dept. de Fisica, Univ. Federal do Ceara, Ceara, Brazil), R.Luzzi.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.479-88 (1983).
The nonequilibrium thermodynamics and relaxation kinetics of a photoexcited plasma in polar semiconductors are discussed using a nonequilibrium statistical mechanics method that allows for the derivation of the nonlinear transport equations which describe the evolution of the irreversible phenomena that take place in the system. The theoretical results are compared with data obtained from ultra-fast time-resolved optical spectroscopy of GaAs and show good agreement. The role of the relevant relaxation channels is discussed, and it is shown that a theoretical and numerical study provides a description of the mechanisms for energy losses which accounts for the behaviour observed in this kind of system in several experiments reported so far. (24 refs.)

67671 **Oscillation of the transparency of metals in a weak magnetic field.** M.A.Lur'e, V.G.Peschanskii, K.Yasemidis (A.M. Gorki State Univ., Sverdlovsk, USSR).
JETP Lett. (USA), vol.36, no.6, p.238-41 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.193-5 (20 Sept. 1982). [received: April 1983]
It is shown that under the conditions of the anomalous skin effect in a weak magnetic field H, parallel to the surface of a conductor, effective electrons form not only the skin layer but also a weakly damped component of the electromagnetic field. As a result, the transparency of thin metallic plates in the microwave range oscillates as a function of the magnetic field, while the period of these oscillations with respect to $H^{-1/2}$ is determined by the location characteristics of the Fermi surface. (3 refs.)

67672 **Stimulated Brillouin scattering of transversely polarized electromagnetic waves in magnetoactive moderately piezoelectric semiconductor plasmas.** S.Ghosh, S.Khan (School of Studies in Phys., Vikram Univ., Ujjain, India).
Phys. Status Solidi b (Germany), vol.116, no.1, p.323-34 (1 March 1983).
An analytical investigation is made of the stimulated Brillouin scattering of a large amplitude, transversely polarized, electromagnetic pump wave produced by both, an electron-plasma wave and acoustical phonon vibrations in a magnetoactive n-type moderately piezoelectric semiconductor. Using the hydrodynamical model of plasma, the general dispersion relation is obtained in the presence of a large magnetostatic field applied at an arbitrary angle θ to the direction of propagation of the pump wave. The analysis is applied to both the cases of isotropic ($B_0=0$) and magnetoactive ($B_0\neq0$) plasmas. The threshold electric field necessary for the onset of Brillouin instability and the growth rate of the unstable Brillouin mode well above the threshold are studied. It is concluded that the threshold pump amplitude as well as the growth rate are strongly dependent on the orientation of the magnetostatic field with respect to the directions and magnitudes of the wave vectors $\mathbf{k}$ and $\mathbf{k}_1$ of the acoustic and scattered electromagnetic waves, respectively. (23 refs.)

67673 **Excitation of magnetoacoustic waves by two microwave beams in InSb.** K.P.Maheshwari, G.Tarey (Dept. of Phys., Government Coll., Kota, India).
Phys. Status Solidi b (Germany), vol.116, no.1, p.339-46 (1 March 1983).
An investigation is made of the resonant excitation of magnetoacoustic wave at the difference frequency of two microwave beams propagating in a magnetoactive solid state plasma, namely n-InSb. Due to the interaction of the two waves in the semiconductor the ponderomotive force at the difference frequency becomes finite and generates a magnetoacoustic wave if the dispersion relation corresponding to magnetoacoustic wave is satisfied. The analysis shows that there is a finite probability of excitation of an acoustic wave alongwith the magnetoacoustic wave. The excited acoustic and magnetoacoustic waves couple at magnetic fields when the thermal pressure is equivalent to the magnetic pressure. The propagation characteristics of the coupled wave are also studied. The results show that microwave beams of power densities 1 MW cm^{-2} excite magnetoacoustic wave of power density 0.04 kW cm^{-2} when $\omega_c/\omega=0.1$. The increase in magnetic field increases the power density of the excited magnetoacoustic wave whereas it tends to reduce the refractive index and attenuation constant of the coupled wave. (12 refs.)

67674 Cooling rates of highly photoexcited electron-hole plasmas in semiconductors. P.Kocevar (Univ. Graz, Graz, Austria), W.Potz, W.Porod.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.220-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reduction of the cooling rates of highly photoexcited electron-hole plasmas in semiconductors by more than one order of magnitude with respect to standard theoretical predictions are explained by the detailed time dependence of the disturbed optical phonon distributions. (11 refs.)

67675 Instability of the electron-hole plasma in covalent semiconductors. M.Combescot, J.Bok (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1014-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors show that the electron-phonon interaction in covalent semiconductors drives an instability in the electron-hole plasma at high temperature. This instability might be the reason for melting of tetrahedrally bound semiconductors. Numerical values are given for germanium and silicon. This model predicts a very high concentration of e-h pairs near melting. (11 refs.)

67676 Electromagnetic waves in a polar semiconductor subjected to an external magnetic field. L.E.Gurevich, D.A.Filippov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1274-5 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1974-6 (Nov. 1982). [received: April 1983]
A theoretical analysis is made of the propagation of electromagnetic waves in an isotropic polar semiconductor subjected to a homogeneous magnetic field. It is shown that the influence of this magnetic field and the interaction with optical lattice vibrations change significantly the properties of such waves. New oscillation (vibration) branches appear, there are new resonances and new limited ranges of frequencies in which these branches exist. (2 refs.)

67677 A germanium oscillator in a pulsed magnetic field. V.I.Gaman, G.F.Karavaev, G.F.Karlova (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.613-17 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.38-41 (July 1982). [received: May 1983]
Experimental data which confirms the presence of hysteresis of the magnetic threshold field of the helical instability of the plasma in a germanium oscillator are presented. It is shown that hysteresis of the threshold magnetic field is due to the inertia of the change in the effective lifetime of the charge carriers in the specimen when the magnetic field is increased and reduced. The dependence of the hysteresis of the theshold magnetic field on the electric field strength, the magnetic field, and the temperature is discussed. (14 refs.)

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

67678 Study of optically induced degradation of conductivity in hydrogenated amorphous silicon by transient grating method. S.Komuro, Y.Aoyagi, Y.Segawa, S.Namba (Inst. of Phys. & Chem. Res., Saitama, Japan), A.Masuyama, H.Okamoto, Y.Hamakawa.
Appl. Phys. Lett. (USA), vol.42, no.9, p.807-9 (1 May 1983).
Optically induced degradation of the conductivity (the Staebler-Wronski effect) in glow discharge hydrogenated amorphous Si was examined by a transient grating method. It was clarified that the Staebler-Wronski effect was a bulk and not a surface effect, and the origin of the decrease of the photoconductivity was mainly attributed to the decrease of the lifetime instead of the mobility. (13 refs.)

67679 Dark and photoconduction in azo dyes. J.P.S.Chauhan, R.C.Rai, A.K.Tripathi, S.C.Mathur (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.149-52 (April 1983).
The authors report dark and photoconductivities studies on two important azo dyes, Eriochrome Black T (EBT) and Eriochrome Blue Black B (EBBB). It is found that the activation energies for photoconduction for these dyes are much smaller than the activation energies for dark conduction suggesting that the photogenerated charge carriers are getting trapped. These trapped charge carriers are released on heating the sample and give rise to electrical conduction. (11 refs.)

67680 Mechanism of hole injection on ferric oxide photoelectrodes. T.Pajkossy (Central Res. Inst. for Phys., Acad. of Sci., Budapest, Hungary).
J. Electrochem. Soc. (USA), vol.130, no.3, p.632-5 (March 1983).
It seems that ferric oxide is advantageous as a semiconductor photoelectrode for utilizing solar energy. Ferric oxide is an n-type semiconductor, its bandgap is reasonable for such purposes, it can be manufactured easily and cheaply, and it is reasonably stable. It does, however, suffer from the disadvantage of low quantum efficiency. The efficiency can be increased if the surface processes are understood, and it is known how to suppress surface recombination. The author determines whether hole injection at the interface proceeds directly from the valence band or via surface states. The photocurrent was measured on ferric oxide electrodes at constant electrode potential and slightly modulated illumination as a function of reducing agent concentration. The average value of the photocurrent was measured directly, and the current transients due to light modulation were recorded, using the signal averaging technique. (17 refs.)

67681 The internal photoelectric effect in InSb with L-band participation. A.R.Beattie (Dept. of Appl. Math., Univ. Coll., Cardiff, Wales).
J. Phys. C (GB), vol.16, no.12, p.2265-80 (30 April 1983).
A theoretical calculation of the quantum efficiency of the internal photoelectric effect in InSb is made. In addition to electron and light-hole impact ionisation and intraband thermalising processes (deformation potential, optical polar mode phonons and particle-particle collisions) there are also included the near-horizontal transitions between the Γ and L conduction bands and between the light-hole and heavy-hole bands. There is good agreement with experiment, with the suggestion that either the L band is lower in energy than previously thought or that there is also the participation of a localised level associated with the L band. (13 refs.)

67682 Effect of light intensity on photoconduction in amorphous selenium films. D.Carles, G.Lefrancois, C.Vautier (LECAP, Faculte des Sci., Monte-Saint-Aignan, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.327-30 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Photoconductivity measurements of amorphous selenium are made on thin films prepared in ultra high vacuum conditions. The variations of the photocurrent I_{ph} versus light intensity F are given by $I_{ph} \sim F^x$ $(0.5 < x \leq 1)$. The experimental data show that x is a decreasing function of the sample thickness. The variations of x are interpreted in terms of diffusion of photoinduced defects. (8 refs.)

67683 A model for photovoltaic centres in ferroelectrics. V.V.Obukhovskii, A.V.Stoyanov.
Kvantovaya Elektron., Kiev (USSR), no.23, p.90-8 (1982). In Russian.
A model of an impurity complex responsible for a bulk photovoltaic effect in ferroelectrics is established. It is proposed that the complex comprises a deep attracting centre and, at some distance from it along the optic axis, a repelling Coulomb centre. Absorption and photovoltaic currents associated with the complexes are discussed. The maximum magnitude of the current is two orders higher than for the case of insulated impurity centres possessing dipole moments. (26 refs.)

67684 Absorption and photoconductivity of In_2Se_3 and Ga_2Te_3. P.Becla, Z.Gumienny, J.Misiewicz, J.M.Pawlikowski (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.143-9 (1982).
Absorption measurements of two III-VI compounds In_2Se_3 and Ga_2Te_3 have been made in the temperature range of 5-300K in the vicinity of their fundamental absorption edges. The energy positions of the absorption edge have been estimated; $E_g(300K) = 1.36$ eV, $E_g(80K) = 1.52$ eV and $E_g(5K) = 1.56$ eV for In_2Se_3, and $E_g(300K) = 1.2$ eV for Ga_2Te_3. Spectral characteristics of photoresponses in the photoconductivity mode have been investigated in the temperature range 80-300K, and near and above the fundamental absorption edges of both semiconductors. The shape of photoresponse characteristics, the detection parameters and possible applications of these materials in the range of infrared and visible radiation are discussed. (6 refs.)

67685 Photomagnetoresistance $Cd_{1-x}Mn_xTe$. M.Lindstrom, P.Kuivalainen, J.Heleskivi (Electron Phys. Lab., Helsinki Univ. of Technol., Helsinki, Finland), R.R.Galazka.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.479-81 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Photoconductivity and photomagnetoresistance (PMR) measurements on $Cd_{1-x}Mn_xTe$ single crystals for x=0.05, 0.30 and 0.50 have been carried out in the temperature range 4.2-200K in magnetic fields up to 10 T. PMR is very large and changes from positive to negative with increasing x. Various mechanisms which could account for the observed PMR are considered. It is concluded that the magnetic field dependent recombination of photocarriers causes a significant contribution especially at low Mn-concentrations. (13 refs.)

67686 The effects of band bending on the photoconductivity in a-SiL:H. W.B.Jackson, M.J.Thompson (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.883-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The effects of band bending on photoconductivity in hydrogenated amorphous silicon were systematically investigated by measuring the photoconductivity on field effect transistors as a function of the applied gate voltage. The intensity and the spectral dependence of the photoconductivity showed large changes due to band bending. The results suggest that much of the conflicting photoconductivity results are due to band bending. There is some evidence for depleting interface gap states by band bending. (7 refs.)

67687 Recombination effects on transient photocurrent in a-Si:H. N.Matsumoto, T.Kagawa, S.Furukawa (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.929-31 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Temperature and illumination pulse width effects on transient photocurrent in nondoped and nitrogen doped a-Si:H were measured. The photocurrent exhibits a power law decay in the form of $t^{-\beta}$ and log i-log t plot shifts towards the short time region as illumination pulse width decreases. β depends not only on gap state density profile but also on recombination rate. They are interpreted using a new multiple trapping model considering the recombination process and the illumination pulse width. (11 refs.)

67688 New calculations of the quantum yield of silicon in the near ultraviolet. J.Geist (NBS, Washington, DC, USA), C.S.Wang.
Phys. Rev. B (USA), vol.27, no.8, p.4841-7 (15 April 1983).
The rigorous expression for the quantum yield for electron-hole pair production was simplified using assumptions inspired by Kane's (1967) random-*k* approximation and by recent results of Alig, Bloom, and Struck (1980). The resulting approximation was intuitively satisfying. It required integration with respect to kinetic energy of the product of the joint distribution of the photongenerated electrons and holes and the average number of electron-hole pairs created by the cascade of impact ionizations initiated by a carrier with a given kinetic energy. The first quantity in the integrand was calculated from a self-consistent, first-principles band structure for silicon; the second was obtained from results of Alig, Bloom, and Struck. The results agreed reasonably well with recent experimental measurements of the quantum yield of silicon in the ultraviolet. (14 refs.)

67689 Amorphous silicon-carbon-fluorine alloy films. R.Dutta, P.K.Banerjee, S.S.Mitra (Dept. of Electrical Engng., Univ. of Rhode Island, Kingston, RI, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5032-8 (15 April 1983).
A new amorphous semiconductor alloy system $Si_xC_xF_y$ has been prepared by RF sputtering of polycrystalline SiC in an $Ar+SiF_4$ atmosphere. Dark conductivity and optical absorption of thin films are measured as functions of F concentration. Infrared spectra indicate a preferential attachment of fluorine to carbon over silicon. The bonded fluorine concentration is estimated to be as high as 40 at.%. The principal reststrahlen band shifts to higher frequencies and appears to sharpen with the increase of fluorine concentration. Fluorinated films are observed to be resistant to high-temperature annealing. (18 refs.)

67690 Transport parameters of partially illuminated semiconductors. G.J.Papaioannou, P.C.Euthymiou, M.J.Papastamatiou (Univ. of Athens, Athens, Greece).
Solid State Commun. (USA), vol.46, no.2, p.165-7 (April 1983).
The use of experimental data for the definition of transport parameters of semiconductors is directly possible when the excess carriers are much less numerous than the thermal equilibrium ones. When this assumption is not fulfilled the data from photo-Hall effect and photoconductivity are average values with relative errors, which in some cases are larger than 30%. By considering the specimen as consisting of two regions—with and without excess carriers—a more accurate definition of these effects is possible; it leads to a better approximation of the real photoelectronic data and, hence, an improved disruption of the semiconductor material. (7 refs.)

67691 Residual conductivity in $GdIn_3S_6$ crystals. G.M.Guseinov, G.M.Niftiyev, M.G.Shakhtakhtinsky (Inst. of Phys., Acad. of Sci., Baku, Azerbaijan SSR).
Solid State Commun. (USA), vol.46, no.2, p.171-5 (April 1983).
Deals with a study of the RC effect in single $GdIn_3S_6$, depending on temperature the electric field and the wavelength of the light. It was found that the multiplicity of the RC at 77K amounts 10^6, the multiplicity of the RC at decreases with increasing temperature at a temperature above 250K the RC disappears and only lasting relaxations (LR) of photocurrent are observed. It was shown that at electric fields from 3.5×10^2 to 2×10^3 V cm^{-1} the value of the current RC state is almost the same as that of the photocurrent. Starting with 2×10^3 V cm^{-1} and above the value of the RC decreases, even though the photocurrent increases. Current voltage characteristics (CVC) in the RC state and the field quenching of RC have been studied. It is noted that the levels with location depths from 0.01 to 0.16 eV in the temperature range from 77 to 90K are responsible for the manifestation of the RC state. It was shown that the low values of trapping cross-sections of the traps with location depths from 0.01 to 0.16 eV, the existence of RC, the quenching of RC by an electric field and the *N*-like CVC, observed in the crystals, are explained within the framework of a heterogeneous-semiconductor model. (11 refs.)

67692 Intraband photoconductivity in coloured amorphous WO_3 films and intervalence transfer model. V.Dallacasa, M.Manfredi, G.Schianchi (Istituto di Fisica, Univ. di Parma, Parma, Italy).
Solid State Commun. (USA), vol.46, no.7, p.561-3 (May 1983).
No photoconductivity has been found in the hopping levels in recent optical end electrical measurements in coloured amorphous WO_3 films. A simple theoretical analysis of the process in the framework of an intervalence-transfer model leads to the conclusion that this photoconductivity is, in fact, not to be expected at low and moderately high electric field values. (11 refs.)

67693 Kinetics of charging of copper impurity centers in Ge during strong laser excitation. Yu.Vaitkus, V.Grivitskas, L.Ionikas, S.K.Novoselov (V. Kapsukas State Univ., Vilnius, Lithuanian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1282-5 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR),* vol.16, no.11, p.1987-91 (Nov. 1982). [received: April 1983]
Investigations were made of the photoconductivity and of the pulse photo-Hall effect in Ge:Sb crystals compensated with Cu. Excitation with neodymium laser pulses caused complete charging of the Cu impurity levels as a result of unipolar capture of holes. An analysis of the relaxation kinetics of the mobility and photoconductivity was used to consider the processes of carrier scattering and recombination. It was found that the Hall mobility in the Δn, $\Delta p\geq3N_{Cu}$ case was due to the electron-hole scattering and hole drag. In the Δn, $\Delta p<3N_{Cu}$ case it was possible to determine separately the electron-capture coefficients of impurity centers characterized by different charge states. (21 refs.)

67694 Photoconduction in heavily doped compensated semiconductors. V.V.Osipov, M.G.Foigel' (Sci.-Res. Inst. of Phys., I.I. Mechnikov State Univ., Odessa, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1305-8 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR),* vol.16, no.11, p.2022-8 (Nov. 1982). [received: April 1983]
A theory is developed for intrinsic steady-state photoconduction in heavily doped compensated semiconductors having deep recombination levels. A consistent analysis is given of the effects of tunneling through random potential barriers by carriers near the mobility thresholds. It is shown that, at sufficiently low temperatures, tunneling plays the decisive part in recombination processes. This makes the recombination barriers much less than the drift barriers, and therefore the recombination time almost independent of the temperature, and the photoconductivity an exponentially increasing function of temperature. The expression obtained, taking account of tunneling, for the recombination rate via deep levels becomes at high temperatures the known expression for this quantity, an activation-type function of the temperature. In the latter case, the photoconductivity in the presence of deep compensating recombination centers or with a correlated impurity distribution depends linearly on the light intensity and decreases exponentially with rising temperature. (11 refs.)

67695 Transient photocurrent behavior in amorphous semiconductors. V.I.Arkhipov, A.I.Rudenko (Engng. Phys. Inst., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1336-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR),* vol.16, no.11, p.2068-70 (Nov. 1982). [received: April 1983]
There has recently been much study of transient photoconduction in amorphous semiconductors. An important feature of these processes is the decisive effect of carrier capture by localized states whose energies are distributed over a fairly wide range in the gap. The authors deal with the case of an exponential energy distribution of localised states, i.e. assume that the number of such states per unit volume in the energy range from $\mathcal{E}$ to $\mathcal{E}+d\mathcal{E}$ is $(N_t/\mathcal{E}_0)$ exp $(-\mathcal{E}/\mathcal{E}_0)d\mathcal{E}$. Such a distribution is known to be common in various amorphous materials. They assume that the bimolecular mechanism of recombination predominates. It is supposed that the carriers of one sign (electrons) are rapidly localized and therefore remain practically at rest, and that recombination occurs as a result of the motion of delocalized carriers of the other sign (holes). (5 refs.)

67696 Gaussian nature of the dispersion in the transport of carriers in glassy As_2Se_3. L.P.Kazakova, E.A.Lebedev, E.A.Smorgonskaya (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1342-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR),* vol.16, no.11, p.2077-80 (Nov. 1982). [received: April 1983]
A detailed investigation was carried out on the nature of carrier dispersion in glassy As_2Se_3 by undertaking investigations of the transport processes in bulk samples prepared directly from a glass ingot by mechanical treatment. the experiments were carried out by measuring the transit time of carriers across a sample. The electric field in the samples was $(0.5\text{-}3)\times10^5$ V/cm and the thickness of the samples was within the range 30-70 μm. A semitransparent gold film was used as the upper electrode. An excess carrier density was created near this electrode by laser radiation. A transient photocurrent pulse was recorded on an oscillograph screen and the shape of this pulse corresponded to a continuous fall of the photocurrent with time. (11 refs.)

67697 Photovoltaic effect due to scattering by charged point defects in ferroelectrics. A.S.Sidorkin, A.P.Lazarev, T.N.Krasova (Lenin Komsomol State Univ., Voronezh, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1617-18 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR),* vol.24, no.9, p.2851-3 (Sept. 1982). [received: April 1983]
The authors determine the coordinate dependence of the potential of charged point defects in the polar phase of a ferroelectric and evaluate the photovoltaic current due to scattering of the carriers by defects of this type. It is assumed that the photoexcitation of electrons into the conduction band is a result of impurity-band transitions. (4 refs.)

67698 Photoconductivity instability in thin polycrystalline CdS layers with high surface-charge density. S.A.Korepanov, P.A.Viktor, V.V.Serdyuk (I.I. Mechnikov Odessa State Univ., Odessa, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.594-7 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR),* vol.25, no.7, p.18-22 (July 1982). [received: May 1983]
The instability of the photocurrent in thin CdS films prepared by the electrohydrodynamic sputtering method is investigated. The degradation of photosensitivity of the films during the prolonged illumination and the restoration of their photosensitivity in dark are explained by assuming the drift of ionized lattice defects in the field set up by negatively charged oxygen adsorbed on the surface of the crystallites. The spatial distribution of the potential in a crystallite is calculated, demonstrating a substantial change in the height and profile of the intercrystallite barriers as a result of the drift of defects. (12 refs.)

67699 Grain boundaries and intragrain defects dependence of local and global electronic and photovoltaic properties of CGE polysilicon. J.Oualid, M.Zehaf, H.Amzil, J.P.Crest, G.Mathian, J.Dugas, J.Gervais, F.Minari, B.Pichaud, S.Martinuzzi (Faculte des Sci. et Tech. de Saint-Jerome, Univ. d'Aix-Marseille III, Marseille, France), J.Fally.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.421-6
Minority carrier properties (L_n, τ_n, μ_n) and photovoltaic parameters (I_{sc}, V_{oc}) have been measured in small MESA diodes revealed in N^+P photocells cut out from different regions of polysilicon ingots (top, middle, bottom or periphery, centre). Their dependence on the physical properties (number of grains N_G per diode, dislocations, impurities) has been analysed. It has been shown that the electronic and photovoltaic properties decrease strongly when the number of grains per diode N_G increases. This influence of the grain size is often screened by intragrain defects. The dispersion of the results can be partially resolved by taking into account the dislocation distribution. Local measurements of photocurrents I_{ph} and diffusion lengths L_n performed with a 5 μm light spot confirm the influence of dislocations on the grain respose. (13 refs.)

72.50 ACOUSTOELECTRIC EFFECTS

67700 Phonon echoes in piezoceramic lead-zirconate titanate. R.M.Holt, J.O.Fossum (Electronics Res. Lab., Norwegian Inst. of Technol., Trondheim, Norway).
Appl. Phys. Lett. (USA), vol.42, no.9, p.787-9 (1 May 1983).
Two-pulses phonon echoes have been generated in piezoceramic lead-zirconate-titanate, using an electric field at twice the frequency of the ultrasonic waves. The echo properties with respect to pulse width, electric field, frequency, and temperature dependences have been studied. It is demonstrated how the phonon echo can be utilized in sorting the pure sound absorption from the grain scattering losses in a ceramic material. (12 refs.)

67701 Evolution of the spectrum of a signal during multitransit generation of acoustic waves in piezoelectric semiconductors. G.D.Mansfel'd, A.A.Rubtsov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1295-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2007-10 (Nov. 1982). [received: April 1983]
A study was made of the process of formation of the spectrum of acoustic waves by multitransit generation in an alternating electric field applied to *n*-type InSb crystals at liquid nitrogen temperature. During the initial stage the spectrum was due to a nonlinear non-Peierls interaction of amplified fluctuations and narrowing of the spectrum occurred at a constant integrated intensity of these fluctuations. After a large number of transits the spectrum of the generated waves consisted of narrow lines and its subsequent evolution was governed by the self-interaction of acoustic waves. (10 refs.)

72.55 MAGNETOACOUSTIC EFFECTS

67702 The theory of the tilt-effect in metals with a complicated Fermi surface. A.V.Eremenko, E.A.Kaner.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.403-11 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
A theoretical study of the dependence of the high-frequency longitudinal sound absorption and velocity on the angle between the magnetic field and the propagation vector is presented in the collisionless limit. It is shown that the phase volume increases and the singularity in electron-phonon interaction intensifies in the case of the quadratic dependence of the longitudinal electron velocity on p_z. That leads to the nonanalytic dependence (the discontinuities) in the sound absorption and velocity. An analysis is presented for the strong and weak connection of electrons with the sound. (2 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

67703 Semiconductor-metal transition in $Bi_{0.8}Sb_{0.2}$ alloys under tension. N.B.Brandt, M.Yu.Lavrenyuk, N.Ya.Minina.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.392-7 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The semiconductor-metal transition in $Bi_{1-x}Sb_x(0.2 \leq x \leq 0.22)$ alloys under tension along the binary axis is observed. The transition is caused by overlapping of energy bands at *L* and *H* points of the Brillouin zone which is responsible for genesis of the energy spectrum of Sb. The arising Fermi surface and its variation with stress are investigated. (9 refs.)

67704 Metal-dielectric type transition in needle crystals of iodine and oxygen doped niobium-sulphur compounds. M.A.Obolenskii, V.I.Beletskii, D.D.Balla, Kh.B.Chashka.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.437-9 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
Needle crystals of iodine and oxygen doped niobium-sulphur compounds were grown. Electrical resistance in temperature range 4.2-300K and current-voltage characteristic of crystals in the temperature range 4.2-5K were studied. Metal-dielectric type transition is found. In temperature range above R_{min} metallic conductivity $1nR \ll T$ is found. At temperatures below R_{min} semiconductor-type conductivity and nonlinear current-voltage characteristics are observed. (3 refs.)

67705 Effect of composition on the structure and electrical properties of As-Se-Cu glasses. M.M.Haifz, M.M.Ibrahim, M.Dongol (Phys. Dept., Assiut Univ., Assiut, Egypt).
J. Appl. Phys. (USA), vol.54, no.4, p.1950-4 (April 1983).
As-Se-Cu glasses, with Cu content varying between 5 and 25 at.%, were produced by quenching from the melt. The values of resistivity and activation energy for conduction decreased continuously with increasing the copper content. Memory switching phenomena was observed in glasses containing Cu less than 20 at.%. Glasses containing higher Cu concentration showed a reverse switching cycle. Thermally induced changes in the structural properties have been examined using X-ray diffraction, differential thermal analysis, and scanning electron microscopy. The results were discussed on the basis of thermally induced transformations. (15 refs.)

67706 Effect of Al electrodes on DC and AC current-voltage characteristics of chalcogenide glass films. T.Takeda (Dept. of Electronics, Tokai Univ., Fukuoka, Japan), G.Nogami.
J. Appl. Phys. (USA), vol.54, no.4, p.2119-20 (April 1983).
DC current-voltage (*I-V*) characteristics and AC switching phenomena have been investigated in amorphous semiconductor films of $Si_{12}Te_{48}As_{30}Ge_{10}$ (STAG) sandwiched between evaporated electrodes of Al and Au on an insulating glass substrate. The results show that Al and Au do not form rectifying contacts to STAG. When oxidized Al is used as an electrode an anomaly is observed in both DC and AC characteristics. (8 refs.)

67707 Electronic transition under pressure in the two-dimensional purple bronze $K_{0.9}Mo_6O_{17}$. J.Dumas, C.Escribe-Filippini, J.Marcus, J.Mercier, D.Salomon, C.Schlenker (Groupe des Transitions de Phases, CNRS, Grenoble, France), F.Razavi.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.602-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The electrical resistivity of $K_{0.9}Mo_6O_{17}$ has been measured between 2K and 300K under pressures up to 1.2 GPa. At low pressures, the temperature of the onset of the CDW is decreased by the pressure. Below 20K, the resistivity rises with decreasing temperature, indicating a semiconducting type behaviour. (13 refs.)

67708 Transport and structural properties of the silver intercalation complexes of $2H\text{-}TaS_2$. G.S.Boebinger, N.I.F.Wakefield, E.A.Marseglia, R.H.Friend (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.608-10 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reports the transport and structural properties of the intercalation complex of $2H\text{-}TaS_2$ formed by electrochemical intercalation of Ag^+ from aqueous solution, of stoichiometry $Ag_{0.65}TaS_2$. The temperature dependent resistivity shows three anomalies, at 190K, 140K and 96K. X-ray measurements of the unit cell parameters indicate that there are structural changes at the upper and lower transitions. Electron diffraction shows the appearance of a superlattice with a doubled in-plane cell constant below the 190K transition. These results are discussed in terms of possible ordering of the Ag ions. (11 refs.)

67709 Metal-nonmetal transition and superconductivity in amorphous $Si_{1-x}Au_x$ system. M.Yamaguchi, N.Nishida, T.Furubayashi, K.Morigaki, H.Ishimoto, K.Ono (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.694-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The metal-nonmetal transition in the amorphous $Si_{1-x}Au_x$ system has been investigated as a function of Au content, x, at temperatures down to 10 mK. The log T and $\sqrt{T}$ dependences of electrical conductivity have been observed in a certain temperature range, depending on x. The results are discussed in terms of localization and electron interactions. Superconductivity has been found for samples with a certain range of x whose superconducting transition temperature depends on x, i.e. 0.1K for x=18.5 at.% and 0.7K for x=35 at.%. (17 refs.)

67710 Loss of dimensionality, localisation and conductance oscillations in n-type GaAs FETs. D.A.Poole (Cavendish Lab., Univ. of Cambridge, Cambridge, England), M.Pepper, H.W.Myron.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.697-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Presents new results for the transition from 3 dimensional (3D) conduction to 2D conduction in a GaAs FET. By applying a magnetic field, B, it is possible to observe 2 metal-insulator transitions at low temperatures by (a) suppression of weak localisation at low B returning the system to metallic conduction and (b) shrinking of the donor wavefunctions at high B localising states at the Fermi energy. Magnetoresistance has been measured over 4 decades of B and for temperatures between 4.2 and 1.2K, the results being in satisfactory agreement with current theories of localisation in 2D and 3D. The authors also present new conclusions for the anomalous oscillations in conductance with applied gate bias observed in most GaAs FETs at low temperatures. The strength of the oscillations is related to the quality of the FET, being predominant in commercial microwave GaAs FETs. (10 refs.)

67711 A thermophonic investigation of switching and memory phenomena in thick amorphous chalcogenide films. J.Kotz, M.P.Shaw (Dept. of Electrical & Computer Engng., Wayne State Univ., Detroit, MI, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.986-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reports the results of thermophonic experiments and numerical analyses of bias-induced threshold switching and memory effects in amorphous films of $Ge_{15}Te_{81}S_2Sb_2$. The results show that the initiation and maintenance of a threshold switching event are fundamentally electronic processes. (24 refs.)

67712 Model of a low-resistivity state formed as a result of nanosecond electric switching in amorphous semiconductor films. S.Balyavichyus, V.Gruzhinskis, A.Poshkus (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1248-51 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1934-7 (Nov. 1982). [received: April 1983]
An investigation was made of the current-voltage characteristics of a low-resistivity state formed a few nanoseconds after monostable electric switching in amorphous films of the $In_{0.25}Te_{0.75}$ composition. It was found that a typical current-voltage characteristic had a linear section which passed through the coordinate origin when extrapolated. The resistance of the low-resistivity state deduced from the slope of this section decreased on increase in the switching voltage and on increase of the thickness of the active material. A model was developed to explain the experimental results and this allowed for the complex topology of the low-resistivity region. The theory agreed with the experimental results on the assumption that the high-conductivity part of the semicon-

ductor was a structure of the Bethe-lattice type with a coordination number of 3. (12 refs.)

72.90 OTHER TOPICS IN ELECTRONIC TRANSPORT IN CONDENSED MATTER

67713 **Effect of the particle sizes of the components on the leakage threshold of the electrical conductivity of a dispersed mixture.** L.A.Bel'kova, E.A.Zamotrinskaya, V.V.Zagoskin, T.G.Mikhailova, V.M.Nesterov (V.D. Kuznetsov Physicotech. Inst., Tomsk Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.585-9 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.10-14 (July 1982). [received: May 1983]
The electrical conductivity of a dispersed mixture of sand and graphite of various granulometric compositions (filling factor k=0.74) was investigated. It is shown that for mixtures which have pore sizes in a structure of dense packing of one component do not exceed the particle sizes of the other component and the threshold volume concentration of the conducting phase is completely determined by the ratio of the particle sizes of both phases. An analytic expression relating the volume threshold concentration of the con-

ducting component and the particle sizes of the components is obtained by solving the bond problem. (6 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

67714 The atomic structure and electronic states of $GaAs_{1-x}P_x$ (110). Xu Yong-Nian, Zhang Kai-Ming (Dept. of Phys., Fudan Univ., China).
Acta Phys. Sin. (China), vol.32, no.2, p.24-50 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The clean surface $GaAs_{1-x}P_x(110)$ has been studied by the EHT method using a cluster model. The authors obtained the following results: (1) the value of the rotated relaxation angle is about 26°. (2) For $x \geq 0.25$ the empty intrinsic cation states are found in the gap near the conduction band edge. (9 refs.)

67715 Study of metal-semiconductor interface states using Schottky capacitance spectroscopy. C.Barret, F.Chekir, A.Vapaille (Inst. d'Electronique Fondamentale, Univ. Paris-XI, Orsay, France).
J. Phys. C (GB), vol.16, no.12, p.2421-38 (30 April 1983).
In a forward-biased Schottky diode, the charge of the interface states can be electrically modulated. This results in the appearance of additional capacitance whose variations with frequency, bias and temperature can be used to determine the characteristic parameters of the states (energy position, density, capture cross sections). A simple model is described, taking into account any possible charge exchanges between the interface states and the three 'reservoirs' surrounding them (conduction and valence bands of the semiconductor and conduction band of the metal). Limit cases where one or two of these exchange paths are dominant are detailed and a few typical experimental examples are given. (18 refs.)

67716 Electronic structure and magnetism of surfaces and interfaces. A.J.Freeman (Dept. of Phys., Northwestern Univ., Evanston, IL, USA).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.31-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Spurred by recent experimental advances, theoretical/computational methods for accurately determining the electronic structure and properties of surfaces and interfaces have been developed. This paper reviews the advanced state of local spin density determinations of the magnetic properties of free surfaces (e.g. Ni and Fe) and interfaces (e.g. Ni on Cu), using self-consistent spin-polarized energy band calculations of the energy dispersion and spatial character of surface and interface states. (32 refs.)

67717 Plasmons, intersubband resonance and localization in inversion layers with periodically structured gate electrodes. E.Batke, D.Heitmann, E.G.Mohr (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.643-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Excitation of plasmons and intersubband resonance has been investigated in electron inversion layers of p-Si(100) and (111) with periodically structured gates. For high electron densities $N_s \gtrsim 6\times10^{12}$ cm^{-2}, a significant increase of the plasmon mass m_p has been found for Si(100), whereas m_p remains constant for the same densities on Si(111). Experiments with floating periodical gates indicate an anisotropic two-dimensional conductivity and localization effects. (13 refs.)

67718 Theory of semiconductor surface reconstruction: Si(111)-7×7, Si(111)-2×1, and GaAs(110). K.C.Pandey (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.761-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The author shows that minimization of the number of broken bonds present at the surface and a π-like bonding between the broken bonds are apparently the two keys to understanding several long-standing puzzles concerning Si surfaces. To fully exploit the above mechanisms, for both the π-bonding and elimination of broken bonds, the surface atoms must rearrange themselves rather thoroughly—namely, the surface topology and the ring structure must be altered. Based only on topological considerations and simple counting of broken bonds, the minimization of the number of broken bonds shows: why the 7×7 surface is terraced, i.e. consists of intersecting steps; why these steps (as well as steps on the cleaved surface) form only in certain crystallographic directions; why the terraces are triangular and not hexagonal; why the surface structure is symmetric 7×7 (as opposed to, e.g. 5×9); and what is the origin of the spatial scale of the 7×7 reconstruction. Of the reconstruction models proposed for the cleaved 2×1 surface, the π-bonding model leads to thelargest total-energy benefit, and only the π-bonding model provides a natural interpretation of the various spectroscopic data on this surface. The author shows that one of the most widely used ideas in the context of semiconductor reconstruction, that of buckling, is inappropriate for homopolar semiconductors. Buckling, however, provides a valid reconstruction mechanism for heteropolar surfaces such as the GaAs(110). These conclusions are based on total-energy and surface-band calculations using the self-consistent pseudopotential method. (16 refs.)

67719 Electronic structure and geometry of group IV semiconductor surfaces. F.J.Himpsel (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.767-70 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Photoemission results for the electronic structure of group IV semiconductor surfaces (C, Si, Ge) are critically reviewed and implications on the surface geometry are discussed. Data are presented for surface states and for core level shifts of surface atoms. (20 refs.)

67720 On the electronic structure of the Si(100)-2×1 surface. J.Pollmann, A.Mazur (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany), M.Schmeits.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.771-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have investigated the electronic structure of the asymmetric dimer model for the Si(100)-2×1 surface using our tight binding scattering theoretical method for semiinfinite crystals on the basis of a realistic bulk Si description. Their results are in good agreement with all available UPS and ARUPS data resolving outstanding discrepancies between previous theoretical results and experiment and they lend strong further support to the asymmetric dimer model proposed by Chadi (1980). (15 refs.)

67721 Pseudopotential total energy calculations for Si(111)-(1×1) and Si(111)-(2×1). J.E.Northrup, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.774-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The total energies of several models of the Si(111) surface have been calculated with the pseudopotential method and the local spin density functional formalism. The 2×1 chain model has the lowest calculated total energy of those structures considered. The energy of the relaxed 1×1 geometry is minimized when the electrons in the surface states have their spins ordered with a 2×1 antiferromagnetic symmetry. Such a surface may exist on laser annealed Si(111)-(1×1). (19 refs.)

67722 Charge- and spin-density wave instabilities on ideal semiconductor surfaces. A.Muramatsu, W.Hanke (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.781-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A microscopic theory of surface elementary excitations is presented, with particular emphasis on semiconductors. Within the framework of this formalism the authors study the conditions for the appearance of electronic (charge- and spin-density wave) instabilities at surfaces. Quantitative calculations for a Si(111) slab, based on a self-consistent pseudopotential band structure, display a pronounced effect of the excitonic (electron-hole) and RPA local-field many-body interactions. Their results show that the ideal paramagnetic surface is unstable with respect to SDWs with wave vectors nearly corresponding to (2×1) and (7×7) superstructures. This is in accordance with recent total energy calculations based on local spin-density pseudopotentials. (7 refs.)

67723 The diamond (111) surface: a dilemma resolved. B.B.Pate (Stanford Electronics Labs., Stanford, CA, USA), B.J.Waclawski, P.M.Stefan, C.Binns, T.Ohta, M.H.Hecht, P.J.Jupiter, M.L.Shek, D.T.Pierce, N.Swanson, R.J.Celotta, G.Rossi, I.Lindau, W.E.Spicer.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.783-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A dilemma due to the experimental observation of a 'clean' unreconstructed elemental semiconductor surface without band gap states is resolved. Results from photon stimulated ion desorption, high resolution low energy electron loss spectroscopy and photoemission spectroscopy find that the conventionally polished (in olive oil) diamond (111)1×1 surface is atomically terminated and electronically stabilized by hydrogen. Thermal desorption of hydrogen upon heating (~1000°C) results in a reconstructed 2×2/2×1 surface with filled electronic surface states in and near the fundamental gap. Exposure of the reconstructed surface to atomic hydrogen (or deuterium) is found to again terminate the surface and remove the near band gap surface states. Apparent inconsistencies (with respect to the experimental literature) in the understanding of the diamond:hydrogen interaction are resolved in terms of our work. (15 refs.)

67724 Intensity anomalies of Auger electron signals observed by incident beam rocking method for Si(111)7×7 and Si(111)$\sqrt{3}\times\sqrt{3}$Ag surfaces. Y.Horio, A.Ichimiya (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.792-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Auger electron signal intensities of Si(LVV) from clean surface and Si(LVV) and Ag(MNN) from $\sqrt{3}\times\sqrt{3}$ Ag surface are measured for various incident angles in [112] orientation of 10 kV electron incidence. RHEED pattern is simultaneously observed during the measurement of the Auger electron signal intensities. Enhancements of Si(LVV) from the clean surface are observed in the surface wave resonance (SWR) conditions due to the 7×7 surface structure. The enhancements are reduced by deposition of silver on clean surface and by constructing the $\sqrt{3}\times\sqrt{3}$ structure. Enhancements of Ag(MNN) from $\sqrt{3}\times\sqrt{3}$Ag surface are observed at the SWR condition due to $\sqrt{3}\times\sqrt{3}$ structure. At the angles of the SWR condition due to $\sqrt{3}$ structure, Si(LVV) signal intensity is not enhanced. (2 refs.)

67725 Theoretical study of the As(100) surface reconstruction of GaAs. D.J.Chadi, J.Ihm, C.Tanner (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), J.D.Joannopoulos.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.798-800 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The reconstruction of the As-terminated GaAs(100) surface was examined using both the tight-binding and the self-consistent pseudopotential methods. Dimer models with unit cells as large as the c-4×4 one seen in electron-diffraction experiments were tested. Unlike the Si(100) surface, symmetric as well as asymmetric dimers are predicted to occur in equal densities at the surface. (20 refs.)

67726 Electronic and vibronic excitations of semiconductor surfaces studied by electron energy loss spectroscopy. H.Luth (Phys. Inst., Rheinisch-Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.810-15 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Different types of excitations which can be studied by high resolution electron energy loss spectroscopy (HRELS) on semiconductor surfaces are discussed: surface phonons, surface plasmons, electronic interband transitions and vibrations of adsorbed molecules. As examples for the main classes of semiconductors results on Si, GaAs, InSb and ZnO surfaces are reported. (25 refs.)

67727 Electron states at abrupt metal-GaAs(110) interfaces. D.Bolmont, P.Chen, V.Mercier, C.A.Sebenne (Lab. de Univ. Phys. des Solides, Pierre et Marie Curie, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.816-18 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The electronic properties of forming metal/GaAs(110) interfaces (M=Ag, Cu, Ga, In), determined from photoemission yield spectroscopy are compared and discussed. They are governed by electron interface states associated with (i) the restructured semiconductor surface unbonded atoms (ii) the formation of bonds between the metal atoms and the atoms of the first GaAs layer. Although the systems form with different atomic arrangements at the interface, the Schottky barrier depends only slightly on the metal. (7 refs.)

67728 Core-level photoemission studies of MBE-grown semiconductor surfaces. R.Ludeke (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), T.-C.Chiang, D.E.Eastman.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.819-21 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The photoemission spectra of Ga-3d, As-3d and Sb-4d core levels reveal a rich surface-derived substructure which is due to changes in the surface bonding environment and indicates one or more surface bonding sites per surface atom. Bulk and surface contributions have been separated and used to determine the stoichiometry of several GaAs(100) surfaces. (7 refs.)

67729 Core level binding energy shifts for reconstructed GaAs(001) surfaces. J.F.van der Veen, L.Smit (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands), P.K.Larsen, J.H.Neave.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.822-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
With the use of surface-sensitive photoemission spectroscopy 3d-core level binding energy shifts have been determined for surface atoms in reconstructed MBE-grown GaAs (001) surfaces. An analysis of As(3d) shifts suggests that the C(4×4) structure is produced by chemisorption of arsenic on the As-rich 2×4 reconstructed surface. (11 refs.)

67730 Surface effects on core electron binding energies of semiconductors. F.Bechstedt, R.Enderlein, D.Reichardt (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.825-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A method is developed for the calculation of surface-induced binding energy changes of core electrons and applied to silicon surfaces. Shifts of solid state potentials due to covalent and ionic charge transfer and of relaxation energies are regarded. Recent experimental results on Si2p core levels at 2×1 reconstructed (111) and (100) surfaces can be partially reproduced. (8 refs.)

67731 Theory of amplification and instabilities of surface polaritons in semiconductors. R.F.Wallis (Phys. Dept., Univ. of California, Irvine, CA, USA), B.G.Martin, J.J.Quinn.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.828-30 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Under suitable conditions, surface polaritons may propagate along the surface of a semiconductor containing free carriers. If a DC electric field is applied so that a drift current flows parallel to the surface, instabilities of the surface polaritons may arise. A theoretical investigation has been made of such instabilities for the case of a planar surface of n-silicon with the current parallel or antiparallel to the propagation direction of the surface polariton. Surface polariton modes having a growing wave character were found for both a silicon-vacuum interface and a silicon-dissipative medium interface. (4 refs.)

67732 The interaction of hydrogen with surface states on GaAs(100). R.D.Bringans (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), R.Z.Bachrach.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.854-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The results of a photoemission study of hydrogen chemisorption on the GaAs(100) surface are presented. Clean (100) surfaces with a range of reconstructions were prepared by molecular beam epitaxy and in all cases the same surface structure resulted from exposure to atomic hydrogen. Angle resolved photoemission measurements revealed a hydrogen induced state at between 4.3 and 5.2 eV below the top of the valence band. The dispersion of this state in the surface Brillouin zone is discussed. (8 refs.)

67733 Observation of nonuniform energy band shifts for Ge on GaAs(100). P.Zurcher, J.Anderson, D.Frankel, G.J.Lapeyre (Dept. of Phys., Montana State Univ., Bozeman, MT, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.857-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Fractional monolayer studies of Ge on GaAs(110) were performed with angle-resolved photoemission at the Wisconsin Synchrotron Radiation Center. Normal emission data for $14<h\nu<27$ eV were analyzed. The most significant effects of the Ge adatoms are shifts in photoemission peaks known to be due to GaAs interband transitions. The shifts, which are nonuniform, are due to specific nonuniform shifts in interband transitions. Valence band (VB) shifts relative to the VB maximum can be determined from some of the transitions. The top VB shifts downward and the next deeper VB shifts upward in the neighborhood of one-third the distance from Γ to X on the Σ line (0.57 $Å^{-1}$). The authors suggest the shifts are the result of chemisorption-induced charge transfers whose resonance-like states decay over several atomic layers below the surface. (9 refs.)

67734 Two-dimensional Wigner lattice in a magnetic field and in the presence of a random array of pinning centers. A.G.Eguiluz, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA), R.J.Elliott.
Phys. Rev. B (USA), vol.27, no.8, p.4933-45 (15 April 1983).
The authors consider a two-dimensional Wigner lattice in the presence of a static external magnetic field perpendicular to the lattice and a random array of pinning centers. The phonons of the electron lattice are treated in the harmonic approximation, and the random distribution of pinning centers is dealt with in the single-site coherent-potential approximation. They obtain the average phonon Green's function and from it the spectral density for the phonons of the electron lattice. The presence of the random array of pinning centers gives rise to a low-frequency gap in the phonon spectral density. Thus the (two-dimensional) mean-square displacement of an electron about its equilibrium lattice site is finite at finite temperatures. The magnitude of the low-frequency gap decreases as the strength of the magnetic field is increased. For sufficiently high fields the gap disappears, but the phonon spectral density vanishes sufficiently fast as $\omega \rightarrow O$ that the mean-square displacement remains finite at finite temperatures. The authors present detailed numerical results for the phonon spectral density and electron mean-square displacement, both at $T=0$K and at finite temperatures. Their results are analyzed from the point of view of the stability of the lattice to thermal fluctuations. They find that at low temperatures ($T\sim1$K) both the pinning centers and the magnetic field considerably enhance the localization of the electrons about their lattice sites, thus enhancing the stability of the lattice. At higher temperatures, the electron mean-square displacement depends very weakly on the strength of the magnetic field, and its value is then determined by the concentration and strength of the pinning centers. (26 refs.)

67735 Scattering-theoretical method for relaxed and reconstructed surfaces with applications to GaAs(110) and Si(100)-(2×1). M.Schmeits (Inst. de Phys., Univ. de Liege, Liege, Belgium), A.Mazur, J.Pollmann.
Phys. Rev. B (USA), vol.27, no.8, p.5012-31 (15 April 1983).
The tight-binding scattering-theoretical method for the calculation of electronic properties of relaxed and reconstructed surfaces is described in detail and applied to the relaxed GaAs(110) surface and the reconstructed Si(100)-(2×1) surface. For the underlying bulk electronic structure, the authors employ realistic empirical tight-binding Hamiltonians retaining first- and second-nearest-neighbor interactions. In their calculations they have used surface-structural models, proposed in the literature on the basis of total energy minimization calculations. These models are in good agreement with low-energy electron-diffraction data. Relaxation- and reconstruction-induced changes in the interaction matrix elements with interatomic distance d are taken into account by the d^{-2} scaling law, as proposed by Harrison. They discuss their results in terms of surface band structures and wave-vector—integrated as well as wave-vector—resolved layer densities of states. These theoretical data allow for a detailed discussion of the origin and physical nature of the surface-induced features. In particular, the effects of relaxation or reconstruction on the ideal surface electronic properties can transparently be analyzed in the framework of the current method. Comparison of their results with both angle-integrated and angle-resolved photoemission data shows very good agreement confirming the charge-transfer bond-angle relaxation model for GaAs(110) and the asymmetric dimer model for Si(100)-(2×1). (49 refs.)

67736 Study of the reconstructed GaAs(100) surface. J.Ihm, D.J.Chadi (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), J.D.Joannopoulos.
Phys. Rev. B (USA), vol.27, no.8, p.5119-21 (15 April 1983).
The reconstruction of an As-terminated GaAs(100) surface has been studied using the self-consistent pseudopotential method. Total energies for the (1×1) ideal surface and the $c(2\times2)$ and $p(2\times2)$ reconstructed surfaces within the dimer model are compared. Unlike the WSi(100) surface, at least two inequivalent dimers are required to produce the semiconducting surface and stabilize the system. Important features in the density of states and the valence-charge distribution are presented. (21 refs.)

67737 Temperature dependence of surface electronic structure of Si(111) surface. T.Yokotsuka, S.Kono, S.Suzuki, T.Sagawa (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Solid State Commun. (USA), vol.46, no.5, p.401-4 (May 1983).
Temperature dependence of angle-resolved ultraviolet photoelectron spectra has been obtained for Si(111) surface starting with a thermally quenched '1×1' surface and ending with a high temperatue '1×1' surface. It has been found that the surface state at 0.8 eV below the Fermi level exhibits degradation with the increase in temperature, which explains the difference of surface electronic structures between a quenched '1×1' surface and a high temperature '1×1' surface. Electron correlation effect in adangling-bond derived surface state is postulated as a cause for the phenomenon. (8 refs.)

67738 Electronic structure evolution of Pd overlayers on Cu. M.Pessa, O.Jylha (Dept. of Phys., Tampere Univ. of Technol., Tampere, Finland).
Solid State Commun. (USA), vol.46, no.5, p.419-22 (May 1983).
Initial formation and subsequent development of the electronic structure in band-by-band detail are studied for epitaxial palladium overlayers deposited onto a copper (111) single crystal substrate. Two-dimensional Bloch states are found to be established at the first full monolayer. The three-dimensional Bloch states characteristics of the Pd bulk crystal begin to be observed upon completion of the second layer. A surface sensitive Pd-derived feature is found to be formed at coverages of two monolayers. (17 refs.)

67739 Electronic structure of the HCP phase of silver-aluminum alloys. U.O.Karlsson, G.V.Hansson, S.A.Flodstrom (Dept. of Phys. & Measurement Technol., Linkoping Inst. of Technol., Linkoping, Sweden).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.58-65 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The close-packed (0001) surface of the ζ-phase of the Ag-Al alloy has been studied with angle-resolved photoelectron spectroscopy. The ζ-phase was obtained by evaporating Ag onto an Al(111) crystal face and was verified by LEED. The polar angle dependence of the photoelectron emission was recorded along the two symmetry lines ΓM and ΓK of the surface Brillouin zone. The creation of the HCP lattice gives two new structures in the spectra. These structures are found around Γ and M in the surface Brillouin zone and are assigned to be emission from surface states located in band gaps induced by the HCP structure. The 4d band emission observed from the ζ-phase Ag-Al alloy is structureless and shows no similarity with the 4d band emission from Ag 4d in crystalline phase. (19 refs.)

67740 Surface core-level shifts at the end and beginning of the transition metal series. M.Erbudak, P.Kalt, L.Schlapbach, K.Bennemann (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.101-4 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Surface core level shifts Δ_c^s of Au, Pd, Rh, Sc, and Ca have been measured by photoemission. (4 refs.)

67741 Core level shifts and valence change at the surface of intermetallic rare-earth systems. G.Kaindl, W.D.Schneider, C.Laubschat (Inst. fur Atom- und Festkorperphys., Freie, Univ. Berlin, Berlin, Germany), B.Reihl, N.Martensson.
Surf. Sci. (Netherlands), vol.126, no.1-3, p.105-11 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Surface effects on valence and 4f as well as 5p binding energies of the dialuminides of the heavy rare earths (RE) including Lu were investigated by high-resolution photoemission using synchrotron radiation. For comparison, Eu, Yb, and Lu metal and $YbZn_2$ were also studied. A divalent surface layer was found for trivalent $SmAl_2$. A pronounced difference between trivalent and divalent (including mixed-valent) RE systems in the sensitivity of core-level binding energies to alloying was found and is discussed in terms of the valence-band structure of these solids. (18 refs.)

67742 Thermodynamic interpretation of core-level binding energies in adsorbates. D.Tomanek (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany), P.A.Dowben, M.Grunze.
Surf. Sci. (Netherlands), vol.126, no.1-3, p.112-19 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Using the 'equivalent cores' approximation in combination with a Born-Haber cycle the authors calculate core-level binding energies for adsorbates on metal surfaces. Since accurate thermodynamic data are required for the molecule both in the initial and in the final state, they restrict the discussion to adsorbed carbon monoxide, surface species that contain nitrogen and the halogens bromine and iodine. Reasonable agreement between theoretical and experimental values is achieved for adsorbates for which the adsorption energies are accurately known and complete final state screening for the adsorbate is expected. (32 refs.)

67743 Electronic excitations in K monolayer adsorbed on Si(100) 2×1. H.Tochihara (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.523-8 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
K adsorption on Si(100) 2×1 has been studied by using angle-integrated electron energy loss spectroscopy, LEED, AES, $\Delta\phi$ and core-level excitations as a function of K coverage. At coverages of 0.25 the insulator-to-metal transition in the K overlayer is observed and the intensity of the overlayer plasmon starts to increase. The plasmon has a one-dimensional character from the standpoint of the structural model of adsorbed K. The energy loss of the plasmon decreases slowly to 1.8 eV. In the case where alkali atoms are adsorbed on metal surface, the energy loss of the plasmon increases with increasing coverage. The different behaviour is discussed based on the structure of adsorbed alkali atoms. (11 refs.)

67744 Electronic structure of bulk and surface vanadyl oxygen vacancies in the layer compound V_2O_5. W.Lambrecht, B.Djafari-Rouhani, J.Vennik (Lab. voor Kristallografie, Rijksuniv. Gent, Gent, Belgium).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.558-64 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The electronic structure of the vanadyl oxygen vacancy in V_2O_5 is studied by means of tight binding methods. The localized states and changes in density of states in the conduction band are calculated by means of a Green function method based on the band structure of a single layer. Atomic relaxation effects are studied by means of cluster models. An inward shift of vanadium into the oxygen layer is found to be energetically favourable. The effect of the relaxation on the localized states is small. Due to the layer structure of V_2O_5, bulk and surface vacancies are similar. (16 refs.)

67745 Surface recombination waves in semiconductors. A.I.Klimovskaya (Inst. of Semiconductors Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1329-31 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2058-61 (Nov. 1982). [received: April 1983]
Recombination waves can exist in a space charge layer, and in this case the surface states act as deep centers and the space charge field controls the fluxes of carriers reaching the surface states. The author considers the behavior of a small fluctuation in a surface space charge layer in a semiconductor. (5 refs.)

73.25 SURFACE CONDUCTIVITY

67746 Surface impedance of thin plates during bilateral electromagnetic field excitation. O.V.Kirichenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.385-91 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
A theoretical study is presented of the surface impedance of metal plates in a surface-perpendicular magnetic field during symmetrical and antisymmetrical bilateral excitation of an electromagnetic field. The effect has been studied of surface scattering of charge carriers on the surface impedance behaviour in strong magnetic fields ($r \ll \delta$, r is the curvature radius of the electron path in a magnetic field, δ is the attenuation depth of the electromagnetic field), where the diffusive character of the reflection may result in concentration of the electric current near the sample boundaries within a depth of about r. The surface dissipation of conduction electrons is described by an integral boundary condition with an arbitrary dissipation indicatrix; possibilities to determine the functionals of the scattering indicatrix by considering the dependence of the surface impedance on the external magnetic field value are shown. (12 refs.)

67747 Surface photo-EMF in mercury-doped germanium at high optical excitation rates. E.A.Gorin.
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1344-5 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2080 (Nov. 1982). [received: April 1983]
An analysis of the magnitude and kinetics of the surface photo-EMF at high excess carrier densities made it possible to estimate the contributions of various mechanisms of the formation of the surface photo-EMF and of the influence of external factors on it. (10 refs.)

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

67748 A reevaluation of the meaning of capacitance plots for Schottky-barrier-type diodes. S.J.Fonash (Pennsylvania State Univ., University Park, PA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1966-75 (April 1983).
Capacitance-voltage (*C-V*) data, in the form of $1/C^2$ versus voltage plots, have long been used to extract information on the space charge region doping and barrier height in Schottky-barrier-type diodes. The meaning of the slope and voltage intercept of these $1/C^2$ versus voltage plots for reverse-biased diodes is reexamined in this analysis for the case when there is an inadvertent or purposeful interface layer present. The possibility of having interface states, one type of which communicates with the metal and another type of which communicates with the semiconductor, is considered, as is the fact that these two classes of states may, or may not, be able to follow an AC signal. The analysis first assumes that the densities of these states do not vary across the gap; this restriction is later relaxed and the possibility of variable densities of interface states is considered. The results of the analysis differ from those of previous studies. In general, it is found that most sets of interface state characteristics lead to nonlinear $1/C^2$ plots when an interfacial layer is present. Constant $1/C^2$ slopes (true straight line plots for all values of reverse bias) are found only if there are no interface states present or only if the states present have a constant density across the gap and follow the metal for all frequencies. (9 refs.)

67749 Formation of the Schottky barrier at the Pd/Si interface. R.J.Purtell, P.S.Ho, G.W.Rubloff, P.E.Schmid (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.834-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The formation of the Schottky barrier (SB) at the Pd-Si interface and its correlation to electronic and structural properties has been investigated. Experiments have been carried out using interfaces with thick and thin metal coverages. The thick contact experiment show that the SBH ϕ_b is independent of the bulk silicide structure and that it can be established upon Pd deposition at room temperature. In the thin contact experiment, the use of a synchrotron radiation source and high-resolution photoemission spectroscopy makes possible simultaneous observations of variations in SBH and valence band spectra from a clean Si surface up to several monolayers of metal coverage. The SBH values from thin and thick-contacts establish the true interface character of ϕ_b. Valence spectra show that SBH can be established without a full development of the metallic character of the reacted overlayer. Combining these results, the authors conclude that the SBH for the Pd-Si interface is determined by the basic interaction between Pd and Si atoms at the interface prior to the development of a metallic band structure and a well-defined silicide phase in the overlayer. (12 refs.)

67750 Stoichiometry effects on Schottky barrier and interface states in GaAs {001}/Al system. C.Barret, F.Chekir, T.Nefatti, A.Vapaille (Inst. d'Electronique Fondamentale, Univ. Paris-XI, Orsay, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.851-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Al growth by MBE has been achieved onto {001} GaAs surfaces with different reconstructions and stoichiometries. No correlation is observed between the initial surface characteristics and the barrier height of the obtained Schottky diodes. A study of interface states distribution by Schottky capacitance spectroscopy shows three kinds of states in the upper half of the gap. These states are not markedly affected by surface stoichiometry variations. (7 refs.)

67751 GaAs Schottky diode barrier heights related to surface and interface states. J.M.Palau, A.Ismail, E.Testemale, L.Lassabatere (Centre d'Etudes d'Electronique des Solides, Univ. Sci. Tech. du Languedoc, Montpellier, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.860-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
GaAs surface and diode results are reported. Surface Fermi level pinning is studied using the topographic Kelvin method. Pinning is caused by submonolayer metal deposition and by ion bombardment. Surface results are compared to diode barrier heights. (20 refs.)

67752 An iterated three-layer model of the double layer with permanent dipoles. J.R.MacDonald (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA), S.H.Liu.
Surf. Sci. (Netherlands), vol.125, no.3, p.653-78 (March 1983).
The problem is attached in a semi-discrete way by first partitioning the space charge region into layers parallel to the planar blocking electrode. Each layer is part of a cubic lattice with lattice-site spacing determined by the pure solvent concentration. Lattice sites may be occupied by ions of either sign or by solvent molecules, taken as spheres having a permanent dipole moment. The solvent molecule finite-length dipoles are then approximated by slabs of constant point-dipole polarization. Thus each of the planes parallel to the electrode is a locus of ion centers, and the polarization is accounted for by equal and opposite charge layers equidistant on either side of an ionic charge layer. The mean polarization and ionic concentration in each three-layer region are determined self-consistently by free energy minimization, and electrostatic equations are employed to couple the electrical conditions in one layer to those adjacent. This ion-dipole model (IDM) is solved self-consistently for arbitrary molarity in two regimes: the weak-field situation where the electrode charge approaches zero, and the arbitrary field-strength regime. (30 refs.)

67753 Surface properties of tin dioxide single crystals. E.de Fresart, J.Darville, J.M.Gilles (Dept. de Phys., Facultes Univ. Notre-Dame de la Paix, Namur, Belgium).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.518-22 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Measurements by low energy electron diffraction (LEED), by Auger electron spectroscopy (AES), of work function (CPD) and of surface conductance ($g_\square$) were performed at room temperature on faces (101) and (100) of SnO_2 submitted beforehand to ionic cleaning and annealing. The authors could identify four ranges of annealing temperatures similar to those observed for the (110) face. A reduced, amorphous and moderately conductive surface was produced below 130 ± 20°C. Then CPD decreased by 200 meV, $g_\square$ increased dramatically and below 310 ± 40°C recrystallization and reoxidation occurred giving, up to 400 ± 30°C, a diffuse p(1×1) structure. The latter became sharp at higher temperatures while CPD was steadily increasing. The evolution of surface stoichiometry is interpreted by a preferential sputtering of oxygen supplemented by tin segregation followed by oxygen diffusion from the bulk. Space charge theory indicates the existence of a degenerate accumulation layer at the surface. (14 refs.)

67754 Charge carrier escape rate from electrode-liquid interface. A.Prock, K.N.Das (Dept. of Chem., Boston Univ., Boston, MA, USA), P.Melman.
J. Chem. Phys. (USA), vol.78, no.7, p.4662-8 (1 April 1983).
Carrier photoinjection after excitation of low dielectric constant medium has been described in terms of forced diffusion of ions away from image forces at the electrode. The rate of this detachment process is expected to have a characteristic dependence on the strength of applied electric field at the electrode. The authors describe an extrinsic photoconductivity experiment using a thin layer cell where space charge modification by dark current of the local field due to injection or blocking effects can be made negligible. At high applied fields the authors find quantitative agreement of photocharge yield with the predicted characteristic behavior. This agreement strongly supports the correctness of the ion detachment model in such systems. (19 refs.)

73.40G Tunnelling: general

(see also 74.50 in superconductors)

67755 Tunnelling through combined potential structures. II. Some examples. S.Takacs (CEFV SAV, Bratislava, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.2, p.73-92 (1983).
The general results for the tunnelling of particles through the system barrier-well-barrier (BWB), evaluated in a recent work of the author, are used for calculating some problems which can be important in the theory of electric and thermal conductivity of crystalline solids with impurities or in disordered structures. The temperature and electric-field dependence of the total transmission coefficient and the total amount of energy conducted by electrons with the Maxwell-Boltzmann distribution are calculated. They determine the electric conductivity and the electron component of the thermal conductivity of solids, respectively. The transmission time τ of electrons through the system BWB is shown to have analogous maxima as the transmission coefficient D. By comparing this time with the transmission time $\bar{\tau}$ between free states of the incoming electrons and the bound states of the well not occupied at this time (e.g. near ionized impurities)-which is also calculated in this paper the trapping probability of electrons by ionized impurities $\approx\tau/\bar{\tau}$ is given. It is shown further that the resonance tunnelling leads to negative-resistance regions in the current-voltage characteristics. The eigen-energies of the system BWB, which were needed for determining the time $\bar{\tau}$ are shown to be always larger than the eigen-energies of the corresponding single well. (13 refs.)

73.40J Metal-to-metal contacts

67756 Thermal- and mass transfer in liquid metal electrocontact bridges. S.N.Kharin.
Elektron. Obrab. Mater. (USSR), no.1, p.20-1 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
Within the framework of the thermal theory of bridge erosion of electrodes, a mathematical model is devised for representing bridge phenomena occurring when electrodes are disconnected. A description is given of the influence of a combination of various factors on processes in a bridge: the value of the current, surface tension, the 'pinch effect', the Joule-Lenz and Thomson effects, heat transfer between the bridge and a solid electrode, and the thermophysical and electrical characteristics. The result of a numerical solution of the dependency of growth of bridge diameter on the current is compared with experimental data. (3 refs.) *A.J.B.*

67757 Properties of Pd/Au thin film layered structures. P.F.Carcia, A.Suna (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2000-5 (April 1983).
The authors have synthesized, by RF sputtering, Pd/Au layered structures with periodicities (Pd+Au layers) that vary from 15-95 Å. The films have been characterized by X-ray diffraction. The individual metal layers have (111) orientation perpendicular to the plane of the film. They accurately model the positions and intensities of X-ray lines by a one-dimensional diffraction grating of Pd and Au layers and relate the observed X-ray line widths to loss of long-range layer coherence induced by dislocations at Pd-Au interfaces. They also find that the in-plane electrical resistivity of the films varies inversely, and the temperature coefficient of resistance directly with the layer period. They account for both of these trends by considering scattering of electrons from the metal interfaces, using a modified Fuchs theory. (25 refs.)

73.40L Semiconductor-to-semiconductor contacts, p-n junctions, and heterojunctions

67758 Modulation doped GaAs-$Ga_{1-x}Al_xAs$ heterostructures grown by atmospheric pressure MOVPE. J.Maluenda, P.M.Frijlink (Labs. d'Electronique et de Phys. Appliquee, Limeil-Brevannes, France).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L127-9 (March 1983).
Single and multiple period modulation doped GaAs-$Ga_{1-x}Al_xAs$ heterostructures have been grown by atmospheric pressure metalorganic vapour phase epitaxy (AP-MOVPE). Single period structures exhibit electron mobilities of 6700, 80000 and 90000 $cm^2.V^{-1}.s^{-1}$ at 300K, 77K, and 4K for a sheet carrier concentration of 7.4×10^{11} cm^{-2}, 8.3×10^{11} cm^{-2} and 3.9×10^{11} cm^{-2} respectively. To the authors' knowledge, these values represent the best mobilities reported in this structure grown by AP-MOVPE. Preliminary results on field effect transistors show a three fold increase of transconductance as temperature decreases from ambient to 77K. Furthermore, the authors report mobility enhancement in 'inverted' structures in which the conducting accumulation layers are located at the interfaces formed by growth of GaAs on top of (Ga, Al)As. (10 refs.)

67759 Theory of silicon superlattices: Electronic structure and enhanced mobility. J.A.Moriarty (Dept. of Electrical & Computer Engng., Univ. of Cincinnati, Cincinnati, OH, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1892-902 (April 1983).
A realistic tight-binding band-structure model of silicon superlattices is formulated and used to study systems of potential applied interest, including periodic layered Si-$Si_{1-x}Ge_x$ heterostructures. The results suggest a possible new mechanism for achieving enhanced transverse carrier mobility in such structures: reduced transverse conductivity effective masses associated with the superlattice band structure. For electrons in [100]-oriented superlattices, a reduced conductivity mass arises intrinsically from the lower symmetry of the superlattice and its unique effect on the indirect bulk silicon band gap. An order of magnitude estimate of the range of mobility enhancement expected from this mechanism appears to be consistent with preliminary experimental results on Si-$Si_{1-x}Ge_x$ superlattices. (16 refs.)

67760 Electron density of the two-dimensional electron gas in modulation doped layers. K.Lee, M.Shur (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA), T.Drummond, H.Morkoc.
J. Appl. Phys. (USA), vol.54, no.4, p.2093-6 (April 1983).
The electron density of the two-dimensional electron gas in modulation doped structures is calculated as a function of the doping density in (Al,Ga)As, the thickeness of the undoped (Al,Ga)As layer, the lattice temperature, and other device parameters. The results of the calculation show that the depletion approximation is not accurate enough and that the Fermi-Dirac statistics (rather than the Boltzmann statistics) should be used in the calculation. A simple analytical model which takes these factors into account is shown to be in good agreement with the authors computer calculations and experimental data. The obtained results may be used to evaluate the maximum intrinsic transconductance and the maximum gate voltage swing for the modulation doped field effect transistors. (13 refs.)

67761 Spectral responses of the n-PbTe/p-$Pb_{1-x}Sn_xTe$ heterojunctions. W.Larkowski, A.Rogalski (Inst. of Tech. Phys., Military Acad. of Technol., Warsaw, Poland).
Opt. Appl. (Poland), vol.12, no.2, p.205-17 (1982).
The influence of the Burstein-Moss effect on the spectral dependence of the absorption coefficient for $Pb_{1-x}Sn_xTe$ and on the spectral characteristics of the n-PbTe/p-$Pb_{1-x}Sn_xTe$ heterojunctions have been analysed. It has been pointed out that for carrier concentration in $Pb_{1-x}Sn_xTe$ above 10^{25} m^{-3} the spectral cutoff of the heterojunction is determined by the PbTe material used. It has been also attempted to fit the characteristics calculated theoretically

for this kind of heterojunctions with those measured experimentally. (27 refs.)

67762 Effect of boundary conditions on hot electron transport in short semiconductors. C.Hamaguchi, K.Terashima, A.Shibatomi, O.Ryuzan (Dept. of Electronics, Osaka Univ., Osaka, Japan).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.238-40 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Importance of the boundary conditions in short semiconductors is demonstrated by solving current continuity and Poisson's equations iteratively. A new method to obtain drift velocity overshoot experimentally in short $n^+n\ n^+$ GaAs samples is described, which is based on the measurements and analysis of the current-voltage characteristics by taking into account of the boundary conditions. The observed overshoot velocity is about 7×10^7 cm/s at 3V application to GaAs sample with 1 μm channel length. The excess electrons near the n^+ contacts were found to result in $J\propto V^{3/2}$ relation in very short samples assuming drift motion for electrons. Therefore an observation of $J\propto V^{3/2}$ is not a good measure for the criterion of the ballistic transport. (10 refs.)

67763 Electron mobility and Landau level width modulation-doped GaAs-$Al_xGa_{1-x}As$ heterojunctions. P.Voisin, Y.Guldner, J.P.Vieren, M.Voos (Groupe de Phys. des Solides, Ecole Normale Superiere, Paris, France), J.C.Maan, P.Delescluse, N.T.Linh.

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.634-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Reports far infrared cyclotron resonance experiments in the high mobility two-dimensional electron gas occurring in modulation doped $Al_xGa_{1-x}As$-GaAs heterojunctions. The data extend over a wide range of temperatures and resonance magnetic fields. The width of the cyclotron resonance line depends strongly on the resonance magnetic field, and the data are interpreted in the framework of Ando and Uemura's (1974) theory. The authors have also investigated the temperature dependence of the linewidth, which is found to behave like the reciprocal Hall mobility. (15 refs.)

67764 $In_xGa_{1-x}As$-$In_yGa_{1-y}As$ strained-layer superlattices: A proposal for useful, new electronic materials. G.C.Osbourn (Sandia Nat. Labs., Albuquerque, NM, USA).

Phys. Rev. B (USA), vol.27, no.8, p.5126-8 (15 April 1983).

Strained-layer superlattices grown from lattice-mismatched layers of InGaAs are proposed as useful electronic materials with tailorable electronic properties. The first study of the electronic properties of these structures has been carried out. Band-gap energies are calculated as a function of layer thicknesses and compositions. The results demonstrate for the first time that the lattice constant, band gap, and transport properties of ternary strained-layer superlattices can be independently varied. This new capability could permit InGaAs strained-layer superlattices to significantly broaden the range of applications associated with the InGaAs ternary compound. (13 refs.)

67765 Intersubband plasmons of a semiconductor superlattice. W.L.Bloss (GTE Labs., Waltham, MA, USA).

Solid State Commun. (USA), vol.46, no.2, p.143-6 (April 1983).

Collective intersubband plasmon-like excitations are predicted to exist for a semiconductor superlattice. These modes arise because the single quantum well depolarization shifted intersubband excitation couples via the long-range Coulomb interaction with the corresponding excitations of the other quantum wells of the superlattice. The dispersion relation for these intersubband plasmons is obtained. (7 refs.)

67766 Differential negative resistance caused by inter-subband scattering in a 2-dimensional electron gas. K.Tsubaki, A.Livingstone, M.Kawashima, H.Okamoto, K.Kumabe (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

Solid State Commun. (USA), vol.46, no.7, p.517-20 (May 1983).

Differential negative resistance has been observed in the range 0.5~1.2 kV/cm at 77K in a two-dimensional electron gas formed at a modulation-doped AlGaAs/GaAs heterojunction interface. This differential negative resistance is attributed to the sudden onset of inter-subband scattering when electrons achieve sufficient energy from the electric field. (19 refs.)

67767 Theory of double injection in structures with a variable-gap base. V.M.Arutyunyan, A.T.Darbasyan (State Univ., Erevan, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1251-3 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1938-41 (Nov. 1982). [received: April 1983]

An investigation is made of the current-voltage characteristics of a P^+-N-N^+ structure with a variable-gap base. Expressions are obtained for the electric field intensity in the base and the current-voltage characteristics are derived for a low injection efficiency. It is shown that a reduction in the band gap in the base toward an N^+-type emitter in the presence of sufficiently strong built-in fields may give rise to a negative resistance region in the current-voltage characteristics. (6 refs.)

67768 Investigation of the temperature and carrier-density dependences of the negative resistance of a silicon point-contact n^+-n junction. V.Blonskis, O.Vasilets, K.Repshas (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1257-9 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1947-50 (Nov. 1982). [received: April 1983]

An investigation was made of the dependence of a negative resistance region in the current-voltage characteristics of a silicon point-contact n^+-n junction on the resistivity of the n-type region (ρ=0.1-4 Ω.cm) at temperatures 78-290K. A reduction in the resistivity and cooling reduced the voltage at the beginning of the negative resistance region and the width of this region, which disappeared for $\rho\approx0.1$ Ω.cm. A numerical modeling experiment showed that the negative resistance decreased when the resistivity of the n-type region decreased because of a reduction in the influence of newly formed minority carriers on the electric field distribution. (10 refs.)

67769 Role of impact ionization in a quasineutral region of a reverse-biased p-n junction in the initiation of avalanche multiplication of carriers. I.V.Grekhov, A.F.Kardo-Sysoev, M.E.Levinshtein, S.V.Shenderei (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1276-9 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1977-82 (Nov. 1982). [received: April 1983]

An investigation is made of a new mechanism of initiation of an avalanche breakdown by impact ionization in a quasineutral region of a reverse-biased junction (diode). It is shown that this mechanism may play an important role in the operation of high-power voltage-peaking circuits utilizing semiconductor devices and can contribute significantly to the initiation of an avalanche in the case of some operating modes of avalanche-transit diodes that are of practical importance. Simple analytic expressions are obtained for estimating the effectiveness of the proposed mechanism. (18 refs.)

67770 Electrical properties of 6H-SiC p-n junctions with an epitaxial p^+-type Al-doped layer. R.G.Verenchikova, Yu.A.Vodakov, D.P.Litvin, E.N.Mokhov, M.G.Ramm, V.I.Sankin, A.G.Ostroumov, V.I.Sokolov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1309-11 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2029-32 (Nov. 1982). [received: April 1983]

Epitaxial growth of a p^+-type Al-doped layer on an n-type base made of 6H-SiC at temperatures 2000-2200°C resulted in the formation in the boundary layer of a region with a high concentration of intrinsic donor-type defects; the thickness of this region was less than 0.1 μ. This was deduced from the capacitance-voltage (C-U) characteristics and also from electroluminescence with features characteristic of defects. This boundary region resulted in a considerable deterioration of the parameters of p-n junctions, particularly of the reverse breakdown voltage U_{br}. The appearance of low-voltage microplasmas was attributed to clusters of intrinsic defects. This was confirmed by the effects of high-temperature annealing, which destroyed such clusters and, consequently, increased the value of U_{br} to the avalanche breakdown voltage of an asymmetric p-n junction with a corresponding net impurity concentration N_d-N_a. (14 refs.)

67771 Formation of p-n junctions in n-type InSb by pulsed laser radiation. S.G.Kiyak, G.V.Savitskii, V.V.Vasil'kova, A.N.Popkov, M.N.Kevorkov (Inst. of Appl. Problems of Mech. & Math., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1321-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2046-8 (Nov. 1982). [received: April 1983]

The authors report a study of the characteristics of the interaction of pulsed laser radiation with InSb single crystals and estimate the effectiveness of laser radiation in the process of inversion of conduction of a surface layer of n-type InSb and consequent fabrication of photosensitive p-n junctions. Laser irradiation was applied to undoped n-type InSb single crystals with a carrier density $\sim10^{14}$ cm^{-3} and a mobility $6.5.10^5$ $cm^2.V^{-1}.sec^{-1}$ at 77K. (7 refs.)

67772 Influence of free carriers on the potential of periodic impurity structures in semiconductors. V.A.Ivanchenko, V.S.Karakhtanov, B.N.Klimov (Sci.-Res. Inst. of Mech. & Phys., N.G. Chernyshevski State Univ., Saratov, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1323-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2048-50 (Nov. 1982). [received: April 1983]

In the discussion of periodic structures in semiconductors, the contribution of free carriers to the form of the potential has usually been neglected. There are, however, structures in which this contribution is comparable with the potential which determines the structure. The study of such periodic structures is important because of their possible applications in semiconductor technology. The authors consider a periodic structure of p-n junctions in which the p-type and n-type layers have equal thicknesses d/2. (3 refs.)

67773 Preparation and properties of n-Si-n-ZnO heterostructures. R.A.Rabadanov, I.Sh.Aliev, M.K.Guseikhanov (V.I. Lenin Dagestan State Univ., Makhachkala, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1334-5 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2065-8 (Nov. 1982). [received: April 1983]

Describes the preparation and the reports the results of an investigation of the electrical and photoelectric properties of n-Si-n-ZnO structures. Polycrystalline zinc oxide films were deposited by the method of chemical transport in a hydrogen atmosphere on single-crystal silicon plates 3×10^{-2} cm thick. In contrast to homojunctions in Si, the investigated heterojunctions are characterized by a wider photosensitivity spectrum and a selection of the optimal carrier density in silicon as well as of the conditions during the deposition of ZnO films can ensure fairly high conversion efficiency. The energy band diagram of n-Si-n-ZnO heterojunctions agrees with the Anderson model. (6 refs.)

67774 Pulsed electron beam annealing of ion implanted germanium for photovoltaic devices. B.Sautreuil, A.Laugier, D.Barbier (Inst. Nat. des Sci. Appliquees de Lyon, Villeurbanne, France), A.Cachard.

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.453-8

The paper deals with the application of short (50 ns) high energy, pulsed electron beam for shallow p-n junction formation in implanted germanium. From time-resolved spectroscopy achieved by means of analysis of diode current and voltage, energy deposition profiles are obtained on the basis of a Monte-Carlo simulation. Temperature-depth profiles are computed. Structures of the annealed samples are studied by RBS plus channeling and SEM. A good annealing is obtained for energy densities above 0.45 J/cm^2 for 12-15 keV mean electron energy. The use of the Ge photovoltaic devices achieved by pulsed electron beam annealing is discussed in the case of Ge-GaAs bicolar systems. (8 refs.)

67775 Potential applications of poly-silicon as an electronic-device material. D.J.Bartelink (Stanford Univ., Stanford, CA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.249-60

Poly-crystalline silicon can be regarded as a true electronic material if good p-n junctions can be made in it or if its state of depletion can be altered by reasonable gate voltages. The three main detrimental effects of grain boundaries on electronic-device function are the action of grain boundary traps as extra charge centers, lifetime killers, and mobility-reducing scattering centers. The current trend in reducing or almost eliminating grain boundaries by laser recrystallization or lateral epitaxy has the effect of reducing the average number of traps. In terms of potential applications of the material, the improvement derived from these procedures must be balanced against other constraints placed on the overall structure. For example, the thickness and quality of the lower oxide (and interface) in these processes will determine whether an electronically active lower gate function is practical. Some currently envisioned applications are discussed. (22 refs.)

67776 Photoelectrochemical study of TiNi alloy oxide layer. V.B.Chougule, S.H.Pawar (Phys. Dept., Shivaji Univ., Kolhapur, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.942-4 (Dec. 1982). [received: April 1983]
The photoelectrochemical (PEC) behaviour of alloy oxide semiconductor electrodes prepared by direct oxidation of TiNi alloy has been investigated. The *I-V* characteristics, power and speed of response characteristics of the PEC cell have been studied. An attempt has been made to explain the speed of response characteristics on the basis of a four-electron reaction occurring in the presence of oxygen molecules adsorbed in the electrolyte. (10 refs.)

67777 Charge storage in a discontinuous Au film, deposited on Si. E.Alkabetz, G.Gorodetsky, V.Volterra (Dept. of Phys., Ben Gurion Univ., Beer Sheva, Israel).
J. Appl. Phys. (USA), vol.54, no.4, p.2128-9 (April 1983).
Relatively large Au islands of the order of 1 μm and a density of $\sim 10^7/cm^2$, in coexistence with much smaller Au islands, were deposited on an *n*-type Si. The observed, randomly distributed Au/Si Schottky junctions, exhibited a diode charge storage with a time constant, $RC \approx 1$ ms. (6 refs.)

67778 Nickel and copper on cleaved indium phosphide: structure, metallurgy and electronic properties. G.J.Hughes, A.McKinley, R.H.Williams (School of Phys. Sci., New Univ. of Ulster, Coleraine, Ireland).
J. Phys. C (GB), vol.16, no.12, p.2391-405 (30 April 1983).
Previous studies of Schottky barrier formation between metals and clean cleaved (110) surfaces of n-type InP have shown that chemically reactive metals (Ni, Fe, Al) pin the Fermi level relatively close to the conduction band whereas unreactive metals (Cu, Ag, Au) lead to pinning closer to mid-gap. The authors have selected Ni and Cu, as representative of each group, and studied the detailed interactions between these and the InP surface using a range of experimental techniques. These include LEED, Auger and photoemission using a laboratory source (He I radiation) as well as a synchrotron source. Nickel was found to interact very strongly with the surface resulting in the formation of nickel phosphides at the interface and the metallic indium diffusing out into the Ni contact. Copper interacts much more weakly with the surface, the core level and valence band photoemission spectra contrast markedly to the behaviour observed for Ni. The formation of Schottky barriers has also been probed by monitoring appropriate shifts in the photoemission spectra. The importance of the interactions at the interface on Schottky barrier formation is considered. Interface widths are also discussed. (29 refs.)

67779 An XPS study of silicon/noble metal interfaces: bonding trends and correlations with the Schottky barrier heights. P.J.Grunthaner, F.J.Grunthaner (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.831-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
This X-ray photoemission (XPS) study demonstrates a correlation of intrinsic TM-Si chemical bond formation with Schottky barrier heights for the near-noble transition metals (TM=Ni, Pd, Pt) and their corresponding silicides (TM_2Si and TMSi) on Si(100). The barrier height correlates with the strength of the TM-Si orbital interaction as well as with the charge density around the Si atom. These observations suggest a dominant role for intrinsic chemical interactions in establishing the Schottky barrier heights in these TM-Si systems. (16 refs.)

67780 Electronic states and Schottky barriers at Pd_2Si/Si(111) interfaces. F.Herman (IBM Res. Lab., San Jose, CA, USA), F.Casula, R.V.Kasowski.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.837-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
It is possible to account for measured Pd/Si Schottky barrier heights (0.71-0.73 eV) by assuming that the interface between Si and Pd_2Si includes a hexagonal Si transition region induced by the presence of Pd impurities. With the Fermi level pinned slightly above the Si valence band edge by hydridized Pd-Si states at the interface, as calculations indicate, the Schottky barrier height is determined primarily by the band gap of hexagonal Si, which is about 0.85 eV. Since Pd atoms are larger than Si atoms, isolated substitutional and interstitial Pd atoms are not readily incorporated into the Si lattice. The authors believe that the Pd impurities form triangular clusters at Si vacancies. Since these clusters are more easily accommodated in hexagonal than in cubic Si, the Si stacking sequence changes from cubic to hexagonal, giving rise to the transition region. (15 refs.)

67781 Electronic properties of gold-silicon (111) 7×7 interfaces. F.Houzay, G.M.Guichar, A.Cros, F.Salvan, R.Pinchaux, J.Derrien (LURE, Univ. Paris Sud, Orsay, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.840-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Au films on 7×7 starting Si surfaces have been investigated by ARUPS using synchrotron radiation and related surface techniques (LEED, AES). At room temperature (RT), the authors observe the early stages of the formation of an alloyed zone $Au_{1-x}Si_x$. After annealing of one gold monolayer (mL) an ordered surface structure is obtained ($\sqrt{3}.\sqrt{3}$ R(30°) LEED pattern). It gives rise to new interface states and appears to be insensitive to oxygen, in contrast to the one mL RT gold deposit. (12 refs.)

67782 Systematic study of 3d transition metal-silicon interfaces by photoemission. Y.Shiraki, K.L.I.Kobayashi (Central Res. Lab., Hitachi Ltd., Tokyo, Japan), H.Daimon, A.Ishizuka, S.Sugaki, Y.Murata.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.843-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Photoemission measurements are done on nickel silicide crystals (Ni_xSi; x=3, 2.5, 2, 1.5, 1, and 0.5) and interfacial compounds formed by Cr, Mn, Co, Ni, and Cu deposition onto cleaved Si surfaces with the use of synchrotron radiation as a light source. The electronic structures in the valence-band region near the Fermi level of these compounds are explained by a simple rigid-band model. (5 refs.)

67783 Si-metal interface reaction and bulk electronic structure of silicides. A.Franciosi, J.H.Weaver (Univ. of Wisconsin, Madison, WI, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.846-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Summarizes synchrotron radiation photoemission results for cleaved, bulk 3d transition metal disilicides and for the interfaces of Si(111)-Cr, Si(111)-Ti, Si(111)-Ca, and Si(111)-Sm. (11 refs.)

67784 Measurements of depletion layers in hydrogenated amorphous silicon. R.A.Street (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4924-32 (15 April 1983).
The use of transient photoconductivity for measuring and profiling the depletion-layer electric field in amorphous silicon is described. Charge-collection measurements yield the depletion-layer width, and this technique is used to study various sample structures. The internal-field profile is obtained from the transient photocurrent response. The author reports measurements on Cr, Pd, and Pt contacts and obtain the built-in potentials and density-of-states data. (15 refs.)

67785 Measurement of cube-root broadening of charge packets in metal-oxide-semiconductor structures. D.F.Nelson, D.L.Abraham, J.A.Cooper,Jr. (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.815-17 (1 May 1983).
The spatial width of electron packets drifting in a nearly uniform electric field in a metal-oxide-semiconductor structure is determined from flux pulse measurements. The width is found to broaden as the cube root of time, thus verifying an earlier prediction. Furthermore, the broadening rate constant is found to agree with that predicted to within 7%. (7 refs.)

67786 Determination of the generation lifetime and surface generation velocity by voltage step method. Zhang Xiu-Miao (Dept. of Phys., Hangzhou Univ., China), Bao Zong-Ming, Su Jiu-Ling.
Acta Phys. Sin. (China), vol.32, no.2, p.239-46 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Simple method for determining both the generation lifetime and surface generation velocity is suggested. By this method, using the data of three points from the MOS capacitance transient response to a step voltage, both the generation lifetime and surface generation velocity can be calculated readily. The experimental results show that this method is reasonable, and indicate that neglecting surface generation velocity would result in reducing of apparent generation lifetime. (9 refs.)

67787 Determination of semiconductor quasi-Fermi level separation under illumination. S.Kar, S.Varma (Dept. of Electrical Engng., Indian Inst. of Technol., Kanpur, India).
J. Appl. Phys. (USA), vol.54, no.4, p.1988-90 (April 1983).
Two new experimental techniques are described for the determination of the quasi-Fermi level separation in a semiconductor material, exposed to illumination. In one method, this separation is obtained from the change in the value of the measured high frequency capacitance of a transparent conductor-oxide-silicon structure in strong inversion, with the intensity of optical illumination. In the other method, the quasi-Fermi level separation is obtained from the shift of the experimentally obtained low frequency space-charge capacitance versus the surface potential curve in strong inversion. Results obtained from the two techniques agreed well. (9 refs.)

67788 Modification of the transient capacitance analysis of GaAs MIS structures for minority carrier lifetime determination. A.B.Bhattacharyya (Centre for Appl. Res. in Electronics, Indian Inst. of Technol., New Delhi, India), E.Lakshmi.
J. Appl. Phys. (USA), vol.54, no.4, p.2116-18 (April 1983).
The insulators of GaAs MIS structures, because of their low temperature deposition, have relatively low resistivities compared to SiO_2. This is respons-

ible for finite leakage through the insulator when a voltage is applied across the MIS structure. The present work reports on the implications of leakage on the transient capacitance plot which is widely used for the determination of minority carrier lifetime in semiconductors. (13 refs.)

67789 Electron-electron scattering in silicon inversion layers. R.A.Davies, M.Pepper (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
J. Phys. C (GB), vol.16, no.12, p.L353-60 (30 April 1983).
The authors present the results of an investigation of the rate of electron-electron scattering in the two-dimensional electron gas of the Si inversion layer. The electron-electron scattering rate was extracted by analysis of the negative magnetoresistance in the regime of weak localisation when $k_F l > 1$, where k_F is the Fermi wavevector and l is the mean free path for elastic scattering. The results showed that over a wide range of $k_F l$, carrier concentration and electron mobility the scattering rate was given by two processes which were additive. The first was the normal T^2 (Landau-Baber) law and the second was the T law expected when the effects of disorder are considered. There was no evidence for the recently proposed $T \ln T$ law. (25 refs.)

67790 Non-metallic transport in silicon inversion layers and the Hall effect. R.A.Davies, M.Pepper (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
J. Phys. C (GB), vol.16, no.12, p.L361-7 (30 April 1983).
The authors present results on the Hall effect in the Si inversion layer in the regime where the temperature dependence of the conductivity is due to corrections arising from the electron-electron interaction. They find that the temperature dependence of the Hall coefficient is independent of the magnitude of the magnetic field which does, however, have a pronounced effect on the temperature dependence of the conductivity. This is not explained by present theories, and suggests that whereas the effects of screening on the conductivity are well understood this is not the case with the Hall effect. (23 refs.)

67791 Thermomagnetic coefficients of inversion layer in high magnetic field. P.Streda (Inst. of Phys., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
J. Phys. C (GB), vol.16, no.12, p.L369-74 (30 April 1983).
The resistivity, thermopower and thermal conductivity of a two-dimensional electron gas (inversion layer) in high magnetic field has been calculated using the Kubo formula. It has been found that all transport coefficients are universal functions of the reduced temperature $k_B T/\hbar\omega_c$ and the reduced chemical potential $\mu/\hbar\omega_c$, provided that the thermal broadening $k_B T$ is substantially greater than the width of the Landau levels. (6 refs.)

67792 Valley splitting and valley degeneracy in n-type silicon (110) inversion layers. H.Kohler, M.Roos (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.579-87 (1983).
The magneto-quantum transport phenomena of silicon (110) *n*-type inversion layers directly reveal the presence of two types of electrons in i=O and O′ electric subband states from their respective quantum oscillations. While the higher i=O′ states are occupied by only about 6% of the total electron concentration in the authors' samples, the i=O electrons populate two valley pairs each, the level ladders of which are shifted in energy by less than the Landau splitting in the range where quantum oscillations are observed. They propose this effect to originate from a slight misorientation ($\Delta\theta < 0.5°$) of the surfaces investigated with respect to the (110) axis. Hence, increasing the gate voltage in a quantizing magnetic field all four i=O valleys are alternatingly occupied in pairs with increasing Landau quantum number in the (110) surfaces contrary to former conclusions on samples with comparable properties. The effect of the magnitude of $\Delta\theta$ on the resulting magneto-quantum oscillations is unimportant for $0 < \Delta\theta \lesssim 0.5°$ as a result of energy minimization for the total electron system. (30 refs.)

67793 Transition from 1-dimensional to 2-dimensional hopping conductivity in silicon accumulation layers. A.B.Fowler, A.Hartstein, R.A.Webb (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.661-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Uses p^+ diffusions to confine electrons in an accumulation layer of n−silicon. This allowed for electrical control of the channel width. When the channel was narrowest the conductance followed $\ln\sigma = -(T_o/T)^{1/2}$; when it was wider it followed $\ln\sigma = -(T_o'/T)^{1/3}$. These results are consistent with a transition from 1 D to 2 D variable range hopping. Strong structure in the conductance as a function of carrier concentration occurred which may be the result of fluctuations in the density of states in the band tail. In the 1 D range, the effect of high magnetic field is to increase the power law; in the 2 D range, magneto-oscilations were observed above 7 T. (14 refs.)

67794 Nonmetallic localization and interaction in one-dimensional (0.1 μm) Si MOSFETs. W.J.Skocpol, L.D.Jackel, R.E.Howard, E.L.Hu, L.A.Fetter (Bell Labs., Holmdel, NJ, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.667-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have fabricated Si MOSFETs having parallel arrays of narrow (0.1 μm) conducting channels. They observe a divergent, nonmetallic decrease of conductance below 30K that is in excellent quantitative agreement with the one-dimensional version of the combined theories for weak localization and interaction effects. They also observe structure in the conductance as a function of gate voltage that they attribute to random variations of the density of states, rather than the regular variations expected for simple one-dimensional quantization. (9 refs.)

67795 1-D minigaps in the subband structure of inversion layers on p-InSb. T.Evelbauer, U.Merkt, J.P.Kotthaus (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.670-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Polarization dependent microwave transmission measurements have been performed on electron inversion layers on high-index surfaces of the single-valley semiconductor InSb. Minigaps are detected in the quasistatic field-effect mobility vs. gate voltage curves as structures, that appear in addition to the mobility peak and the onset of the occupation of higher subbands. The interpretation of these structures as caused by 1-D minigaps in the 2-D subband structure is supported by their energetical position which coincides with theoretical predictions as well as by their polarization dependent influence on the microwave absorption. (7 refs.)

67796 SiH and SiOH electromodulation at Si-SiO$_2$ interfaces in a multiple internal reflectance configuration. A.Stella (Istituto di Fisica Generale, Pavia, Italy), L.Miglio, E.D.Palik, R.T.Holm, H.L.Hughes.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.777-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Electromodulation of SiH and SiOH vibrational bands at a hydrogen-implanted Si-SiO$_2$ interface in a multiple-internal-reflectance configuration is reported. Dipole strengthening and Stark shifts are calculated and theoretical lineshapes derived from their combinations are compared with the experimental electromodulation curves. (7 refs.)

67797 Time-of-flight measurements in a-Si alloy films predominance of displacement current effects. M.Silver, E.Snow, B.Wright, M.Aiga, L.Moore (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA), V.Cannella, R.Ross, S.Payson, M.P.Shaw, D.Adler.
Philos. Mag. B (GB), vol.47, no.4, p.L39-44 (April 1983).
The photoresponse through a p-i-n a-Si:F:H structure from 200 ps laser excitation has been studied by reversing the internal electric field during the current pulse. The initial photocurrent does not change sign. This proves that the photoresponse resulting from the laser excitation is due to displacement currents originating in the junction space-charge region rather than the drifting carriers. Pulsed high-level injection results for the same samples yield a value of approximately 800 cm^{2}V^{-1} s^{-1} for the majority-carrier band mobility. (6 refs.)

67798 Observation of the second subband occupation in the *p*-type (111) Si inversion layer. G.M.Gusev, Z.D.Kvon, I.G.Neizvestnyi, V.N.Ovsyuk (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Solid State Commun. (USA), vol.46, no.2, p.169-70 (April 1983).
Reports observations of the features in the conductivity and the anomalous magnetoresistance of a two-dimensional hole gas near (111) silicon surface, which gives evidence for the onset of second subband occupation at a hole density $p_s \approx 5.3 \times 10^{12}$ cm^{-2}. (7 refs.)

67799 Frequency dependent Shubnikov-de Haas oscillations in Si-MOS-FET under high magnetic fields. Y.Iwasa, G.Kido, N.Miura (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Solid State Commun. (USA), vol.46, no.3, p.239-42 (April 1983).
The quantum oscillations in the AC magnetoconductance was studied for inversion layers in Si-MOS-FETs under high magnetic fields at 1.5K. Each peak in the Shubnikov-de Haas oscillation was found to be remarkably sharpened with increasing frequency up to 50 MHz. It was also found that the width of the gate voltage for non-conductive region (σ_{xx}=0) increases with increasing frequency. (24 refs.)

67800 Quantum Hall studies in Si MOSFETs for $\nu \leq 1$. D.A.Syphers (Dept. of Phys., Brown Univ., Providence, RI, USA), J.S.Brooks, P.J.Stiles.
Solid State Commun. (USA), vol.46, no.3, p.243-5 (April 1983).
The authors have observed inhibition of the Hall effect for densities within the lowest Landau level and demonstrate that a system of non-interacting electrons cannot account for this behavior. They also show that the usual method for determining conductivity parameters could cause errors at low densities and suggest a new method for determining these parameters. (12 refs.)

67801 Theory of the quantized Hall conductivity plateaus of two-dimensional electron systems. A.Isihara (Dept. of Phys., State Univ. of New York, Buffalo, NY, USA).
Solid State Commun. (USA), vol.46, no.3, p.265-7 (April 1983).
The width of the plateaus of the quantized Hall conductivity of two-dimensional electron systems is expected to drop sharply as a function of $\mu_B H/kT$ from the zero point value of $2m\mu_B H/\pi\hbar^2$, when it is expressed in terms of electron density. (4 refs.)

67802 Generating properties of Al-Tb$_2$GeS$_5$-Ge MIS structures. V.F.Agafonnikov, V.I.Gaman, S.F.Glushchuk, L.I.Terekhina.
Sov. Phys. J. (USA), vol.25, no.7, p.603-6 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.28-31 (July 1982). [received: May 1983]
The nature of AC generation in an aluminum-amorphous terbium thiogermanate-monocrystalline germanium structure is discussed. An expression obtained for the frequency (f) of the generated current satisfactorily describes the experimentally observed dependences of f on the load resistance R_L, temperature, thickness of the Tb$_2$GeS$_5$ film, and the area of contact with it (S). The specific rate of carrier generation in the germanium space-charge region is calculated from plots of f^{-1} against R_L and S. (5 refs.)

67803 Theory of MOSFET operation in small-grain polysilicon. S.W.Depp, B.G.Huth, A.Juliana, R.W.Koepcke (IBM Res. Lab., San Jose, CA, USA).
Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.297-309
The operation of a MOSFET transistor fabricated in undoped, small-grain polysilicon is considered, and a model is developed which can predict threshold and drain current as a function of gate voltage. A two-dimensional calculation is described for the band-bending under the influence of a gate potential with the assumption that the grain boundaries are repetitive and oriented at right angles to the gate-oxide/polysilicon interface. Both hole and electron traps are assumed present at the grain boundaries and are coincident in energy with the intrinsic Fermi level at room temperature. An energy barrier to the flow of carriers is present in the undoped polysilicon, and the magnitude of this energy barrier is dependent on the gate voltage. The band-bending occurs over much shorter distances than the intrinsic Debye length, and the trapped charge at the grain boundaries behaves very similarly to the charged impurities in a depletion model. The two-dimensional model can be approximated by a one-dimensional calculation for the band-bending by making the assumption that the trapped charge is uniformly distributed throughout the grain. The results of this calculation can be used to calculate the magnitude of the free carriers in the channel region. Using this information, the dependence of the potential barrier on gate voltage, and the gradual channel approximation for an FET, one can compute the drain current vs. gate voltage, and the results of these calculations are given for parameters used in fabricating actual devices. Finally, experimental results are compared with the model for typical transistors fabricated in undoped, small-grain polysilicon. (7 refs.)

67804 Annealing behavior of the Kondo-type zero-bias conductance peak in Ta-Ta$_2$O$_5$-Ag tunneling junctions. M.Brunner, H.Ekrut, A.Hahn (Inst. fur Werkstoffe der Elektrotech., Ruhr-Univ. Bochum, Bochum, Germany).
Solid State Commun. (USA), vol.46, no.3, p.259-61 (April 1983).
In annealing Ta-Ta$_2$O$_5$-Ag tunneling junctions the oxide barrier of which has been prepared by short-time room temperature oxidation, the authors observe a systematic decrease of the well-known Kondo-Appelbaum zero-bias anomaly. This decrease is due to electron transfer from low oxidation state magnetic Ta ions in the barrier near the Ta electrode to oxygen near the Ag electrode. (11 refs.)

67805 Formation of high asymmetric oxide tunnelling barriers on niobium and tantalum. A.Hahn, M.Brunner, H.Ekrut (Inst. fur Werkstoffe der Elektrotech., Ruhr-Univ., Bochum, Germany).
Thin Solid Films (Switzerland), vol.102, no.3, p.221-30 (22 April 1983).
A background tunnelling conductance that is only slightly voltage dependent and is asymmetric with respect to bias polarity has been observed for Nb/(niobium oxide)/Ag and Ta/(tantalum oxide)/Ag tunnelling junctions, indicating unusually high asymmetric barriers. These barriers result from chemisorption of anions on the oxide surface after countercontacting. The anions (representing less than one-tenth of a monolayer) must be supplied by grain boundary or bulk diffusion from the dirty silver surface. For tantalum, all stages of barrier formation are observable during thermal annealing or voltage annealing. For niobium, formation proceeds in the unmeasurably small resistance regime and only the final state is observable. The process is restricted to an oxide thickness below 20 Å corresponding to room temperature oxidation times shorter than 1 hour. (16 refs.)

67806 Thermionic emission current in the MSM system. J.Stepniewski, M.J.Malachowski (Inst. of Tech. Phys., Military Acad. of Technol., Warszawa, Poland).
Electron Technol. (Poland), vol.13, no.1-2, p.67-77 (1980).
The authors are concerned with the numerical analysis of carrier transport through a system of metal-semiconductor-metal (MSM). It has been assumed that over-barrier thermionic emission is the main mechanism of carrier transport. Both two barrier system (where the semiconductor is not completely depleted) and single barrier system (the semiconductor is completely depleted) are considered. Distributed of an external voltage applied to the system on two barriers has been found. Numerical analysis of the influence of semiconductor parameters (doping concentration, thickness, temperature, barrier height) on current density, as a function of voltage, clearly shows that minority current predominates over majority current in the single-barrier system, as opposed to MS contact or two-barrier MSM contact. (10 refs.)

73.60F Semiconductor films

67809 Electrical properties of AgGaSe$_2$ epitaxial layers. H.Neumann, E.Nowak, B.Schumann, G.Kuhn (Sektion Phys. und Sektion Chem., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.477-81 (1983).
Epitaxial layers of AgGaSe$_2$ with thicknesses in the range from 50 to 70 nm were deposited onto (111)A-oriented semi-insulating GaAs substrates by flash-evaporation in the substrate temperature range T_s=825...900K. Films grown at $T_s \leq 850$K are n-type conducting whereas p-type conductivity was observed at $T_s \geq 875$K. In the p-type samples two acceptor states with ionization energies of 60 and 410 meV were found from an analysis of the electrical measurements. (27 refs.)

67810 The effect of the structure of polycrystalline Cd$_x$Hg$_{1-x}$Te (x=0.1) thin films on their admittance. E.Z.Pawlak (Inst. of Electron Technol., Warsaw Tech. Univ., Warszawa, Poland).
Electron Technol. (Poland), vol.13, no.1-2, p.43-53 (1980).
The author presents the results of the investigation of the admittance of Cd$_x$Hg$_{1-x}$Te (x=0.1) thin films of various grain size and number of boundary regions. The obtained results reveal a relation between the crystalline structure of the films and the admittance measured by a contactless HF method in the range 1 to 250 MHz. (9 refs.)

67811 Determination of deep trap density in *n*-type epitaxial GaAs. A.K.Saxena (Dept. of Electronics & Communication Engng., Univ. of Roorkee, Roorkee, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.923-5 (Dec. 1982). [received: April 1983]
A new analysis of the capacitance-voltage relationships for a Schottky barrier diode is presented, which determines the density of deep trap levels lying in the forbidden energy gap of epitaxial GaAs crystals. A novel feature of the technique is that it avoids the prior determination of the trap activation energy to determine the trap density. The method has been successfully applied to *n*-type vapour phase and liquid phase epitaxial GaAs crystals; the results are found to be in good agreement with those obtained with other well-established techniques. (5 refs.)

67812 Energy band-gap shift with elastic strain in Ga$_x$In$_{1-x}$P epitaxial layers on (001) GaAs substrates. H.Asai, K.Oe (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
J. Appl. Phys. (USA), vol.54, no.4, p.2052-6 (April 1983).
It is demonstrated that the energy band gap in epitaxial layers is changed by biaxial elastic strains which are produced by lattice mismatches in heterostructures. The epitaxial layers used in this work were Ga$_x$In$_{1-x}$P layers grown on (001) GaAs substrates by liquid phase epitaxy. The energy band-gap shifts were determined by comparing the photoluminescence peak energies of the as-grown Ga$_x$In$_{1-x}$P layers with those from free-standing layers removed from the GaAs substrates. It was experimentally found that the energy band gap shifts linearly with the elastic strain in the layer. Assuming that the lattice mismatch was accommodated only by the elastic distortion, the energy band-gap shifts in Ga$_{0.5}$In$_{0.5}$P alloys were also calculated. The calculated results are 6.0 eV or 4.9×10^{-12} eV/dyn cm^{-2} per unit strain or stress, respectively, for the [100] and [010] biaxial elastic stress. These values are in quite good agreement with the experimental results. (20 refs.)

67813 A study of impurities and traps in liquid phase epitaxial InP in relation to melt prebaking. J.K.Rhee, P.K.Bhattacharya (Dept. of Electrical & Computer Engng., Oregon State Univ., Corvallis, OR, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.700-3 (March 1983).
Deep- and shallow-level defects in liquid phase epitaxial InP have been detected and characterized by transient capacitance, Hall transport and photoluminescence measurements. The background impurity levels in the undoped crystals were varied by varying the period of prebaking of the In melt. A single deep electron trap with activation energy $\Delta E_T = 0.38 \pm 0.02$ eV is present dominantly with a concentration almost three orders lower than the background carrier concentration in the layers. From electron capture measurements, the electron capture cross section is found to obey the law $\sigma_n(T) = 4.78 \pm 10^{-15} \exp(-0.13/kT)$. The consistency of its concentration, irrespective of the purity of the crystal, and its removal after short-term heat-treatment leads the authors to believe that the trap is related to native defects. A hole trap with an activation energy of 0.22 eV was detected in some samples at low temperatures. (19 refs.)

67814 Evaluation and control of resistivity in N$^-$/N$^+$ epitaxial depositions. J.L.Sachitano, V.C.Kannan (Tektronix Labs., Tektronix Inc., Beaverton, OR, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.704-8 (March 1983).
Autodoping from 0.001 Ω-cm arsenic-doped silicon wafers interferes with the use of 10 Ω-cm P-type wafers for evaluating epi resistivities. A diffused layer is formed in the test wafers by arsenic atoms that evaporate from the N$^+$ wafers during the post-HCl bake prior to deposition. This layer leads to an erroneous four-point probe measurement of the epi-layer sheet resistance on the test wafer. A model is given that describes the formation of the diffused layer and its dependence upon the number of N$^+$ wafers. The model accounts for the epi resistivity as determined from the test wafer. A two-step epi procedure is described that allows the use of this type of test wafer for evaluating resistivities up to ≈30 Ω-cm. (19 refs.)

67815 Electronic properties of microcrystalline silicon prepared in the glow discharge plasma. W.E.Spear, G.Willeke, P.G.LeComber (Carnegie Lab. of Phys., Univ. Dundee, Dundee, Scotland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.908-13 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Reviews the preparation and structure of glow discharge microcrystalline Si and then deals in some detail with recent work on electronic properties. Conductivity, Hall effect and thermoelectric power measurements are discussed and it is concluded that crystalline semiconductor theory provides a consistent interpretation of the data. Field effect results confirm that in the microcrystalline phase the electron tail states of a-Si become de-localised. (26 refs.)

67816 Dependences of ESR and electrical properties on P doping ratio for microcrystalline Si. S.Hasegawa, S.Narikawa, Y.Kurata (Dept. of Electronics, Kanazawa Univ., Kanazawa, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.914-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The dependences of ESR, conductivity and X-ray diffraction profiles on P doping ratio are investigated for microcrystalline Si films. It is concluded that the tail state width in the amorphous phase portion is narrower than amorphous Si films, and the conductivity in the amorphous phase for the doped film largely increases over that in amorphous Si films as a result of a shift of the Fermi level to around 0.1 eV below conduction band. The crystalline size is about 200 Å and the mobility in the crystallite is consistent with that in crystalline Si. (10 refs.)

67817 Electronic transport in hydrogenated amorphous silicon. H.Overhof (Fachbereich Phys., Univ.-Gesamthochschule Paderborn, Paderborn, Germany), W.Beyer.
Philos. Mag. B (GB), vol.47, no.4, p.377-92 (April 1983).
The authors discuss various mechanisms proposed to explain the deviation of DC conductivity $\sigma(T)$ and thermopower $S(T)$ from an activated law. They confirm the result obtained by Emin (1977) that the variation of the band-gap with temperature leads to a modification of the transport parameters in addition to that caused by the statistical shift of the Fermi level. They demonstrate that, independent of doping and of the deposition conditions, all samples prepared by glow-discharge decomposition of SiH$_4$ exhibit a single transport mechanism, except for a possible hopping contribution. (34 refs.)

67818 Size anisotropy of the transverse magnetoresistance of epitaxial *n*-type GaAs films. M.G.Lukashevich, V.F.Stel'makh (V.I. Lenin State Univ., Minsk, Belorussian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1351-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2091-2 (Nov. 1982). [received: April 1983]
Investigates a manifestation of the size effect in the transverse magnetoresistance at 77K. The film thickness was varied using the layer-by-layer etching

method. The magnetoresistance was measured in a weak electric field and in magnetic fields up to 10 kOe in the n$\parallel$H configuration which gave $(\Delta\rho_\perp/\rho_0)_\parallel$, as well as in the n$_\perp$H configuration which yielded $(\Delta\rho_\perp/\rho_0)_\perp$, the angle ψ between normal **n** to the film surface and the magnetic field direction being unrestricted. Epitaxial films homogeneous over the surface area were grown on semiinsulating gallium arsenide substrates. Measurement of the physical magneto-resistance of epitaxial n-GaAs films at 77K is possible if the film thickness is a least 5 μm. Then, the experimental error (a reduction in the transverse magneto-resistance due to the size effect over the cooling length) does not normally exceed 20-30%. (5 refs.)

67819 Change in electrophysical properties of PbTe thin films under the action of oxygen. Yu.A.Boikov, V.A.Kutasov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1813-14 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3192-4 (Oct. 1982). [received: April 1983]
The authors study the kinetics of the variation of the properties of freshly deposited PbTe films when in contact with the atmosphere. A specially developed procedure made it possible to measure the electrical resistivity ρ, the Hall constant R_x, and the thermoelectromotive force α in the thin films at various temperatures (77-700K) in a high vacuum immediately after deposition and at a higher pressure right up to atmospheric. (4 refs.)

67820 The electrical properties of CuInSe$_2$ thin films deposited onto CaF$_2$ substrates. H.Neumann, E.Nowak (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany), G.Kuhn, B.Geise.
Thin Solid Films (Switzerland), vol.102, no.3, p.201-8 (22 April 1983).
CuInSe$_2$ thin films were deposited onto (111)-oriented CaF$_2$ substrates by flash evaporation in the substrate temperature range T_s=650-890K. Epitaxial growth was found at T_s=770-800K; at lower and higher substrate temperatures the films were partly polycrystalline. Films produced at $T_s \leq 675$K showed n-type conductivity due to a donor with an ionization energy of 78±5 meV ascribed to indium interstitials. At $T_s \geq 725$K the films exhibited p-type conductivity due to a shallow acceptor with an ionization energy characteristic of indium vacancies. The important role of the substrate material in establishing the electrical parameters of CuInSe$_2$ thin films is proved by a comparative study of thin films deposited onto GaAs and CaF$_2$ substrates. (26 refs.)

67821 Modulation of the electrical conductance of phthalocyanine films by circularly polarized light. T.W.Barrett (Chem. Div., Naval Res. Lab., Washington, DC, USA).
Thin Solid Films (Switzerland), vol.102, no.3, p.231-44 (22 April 1983).
The modulation of the electrical conductance by circularly polarized light of phthalocyanine films sublimed onto an interdigital electrode surface (metal/semiconductor/metal structure) is reported. The influence of bound oxygen in creating the p-type semiconductor behavior of the phthalocyanines has been investigated. The Fermi level of the phthalocyanine electrode system may be changed by circularly polarized light acting as an effective magnetic field in an inverse Faraday effect. (34 refs.)

67822 Anomalous temperature dependence of CdS film conduction due to oxygen diffusion and chemisorption. V.P.Panov, G.D.Sizova, V.N.Potapov.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.457-9 (March 1983). In Russian.
Investigates the mechanism of anomalous temperature dependence of conductivity in inhomogeneous chemically deposited CdS films in the temperature interval 10-300°C. The conductivity anomaly is observed only in an oxygen atmosphere and disappears during annealing in vacuum at 150-200°C. (10 refs.) *V.G.P.*

67823 Injection-stimulated blackening of As$_2$Se$_3$ films. B.S.Vakarov, L.E.Stys, M.G.Foigel', V.G.Tsukerman, L.V.Tsybeskov.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.463-5 (March 1983). In Russian.
Investigates the influence of injection on the spectral dependence of the photoconductivity of Au-As$_2$Se$_3$-Cr structures at T=0°C. The spectra shift towards the lower photon energy direction (darkening) is explained by the change in the spectral dependence of the absorption coefficient due to the recharging of deep centres in As$_2$Se$_3$. The results show that these centres are characterised by strong electron-phonon interactions. (5 refs.) *V.G.P.*

67824 Influence of light exposure on the transport properties of a-Si:H films. D.Hauschildt, W.Fuhs, H.Mell, K.Weber (Fachbereich Phys., Univ. Marburg, Marburg, Germany).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.448-53
The influence of strong illumination on the conductivity σ, thermopower S and field effect in glow discharge deposited a-Si:H-films is studied. The activation energies E_σ and E_S increase appreciably by exposure to light. Simultaneously the difference, E_σ-E_S, rises from ~0.1 to 0.21 eV. These changes anneal completely at temperatures above 170°C. The field effect data suggest that mainly defect levels near midgap are created, whereas no marked changes occur in the band tail region. The authors' results cannot be explained by models which assume that the samples are homogeneous. It is argued that transport takes place in extended states and that light exposure leads to an enhancement of spatial fluctuations of the mobility edge. These may arise from a strongly inhomogeneous distribution of charged defects. (15 refs.)

67825 Physical and electrical properties of polycrystalline silicon thin films. K.C.Saraswat (Integrated Circuits Lab., Stanford Univ., Stanford, CA, USA).
Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.261-74
Physical and electrical properties of chemically-vapor-deposited polycrystalline silicon films have been investigated. Effects of deposition parameters, doping, and high temperature processing on grain size and orientation, carrier concentration, carrier mobility and electrical resistivity, have been studied. By relating the physical and electrical properties to each other it has been shown that electrical conduction is controlled by dopant segregation, carrier tunneling, and trapping at grain boundaries. Models for these three mechanisms have been developed and by combining them a generalized model for electrical conduction has been developed. Presence of grain boundaries has also been shown to strongly influence the thermal oxidation and dopant diffusion in polycrystalline silicon. (23 refs.)

73.60H Insulating thin films

67826 Effect of anodic growth temperature on native oxides of *n*-(Hg, Cd)Te. E.Bertagnolli, M.Bettini, E.Gornik (Inst. for Experimental Phys., Univ. of Innsbruck, Innsbruck, Austria).
Appl. Phys. Lett. (USA), vol.42, no.9, p.824-6 (1 May 1983).
The insulating behavior of anodically grown native oxides on Cd$_{0.23}$Hg$_{0.77}$Te can be improved considerably by performing the anodic process at increased temperatures. For the first time, anodic oxides were grown at 50°C in the standard ethylene glycol-KOH-electrolyte which show a reduction in the high-frequency (1 MHz) conductivity of the order of one magnitude respective to the room-temperature grown oxides. A high electrical breakdown voltage (1.5 MV/cm) and a decreased hysteresis shift (50 mV) underline these results. Other oxide parameters such as fixed oxide charges and fast surface states and the excellent DC resistivity remain practically unchanged. Subroom-temperature grown oxides, however, are extremely unstable. (14 refs.)

67827 Anomalous strain sensitivity of polycrystalline bismith antimony telluride films. Sh.B.Atakulov, T.Azimov, A.N.Shamsiddinov (M. Ulugbek State Pedagogical Inst., Fergana, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1326-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2053-5 (Nov. 1982). [received: April 1983]
The authors have carried out a detailed investigation of the structure and properties of bismuth antimony telluride films with anomalously high values of the strain sensitivity. These films were prepared by thermal condensation of (Bi, Sb)$_2$Te$_3$ in vacuum on substrates made of PM-1 polyimide. The film structure was studied with a scanning electron microscope. The current-voltage characteristics recorded at various temperatures and the results of structural investigations led to the following conclusion: the current in strain-sensitive (Bi, Sb)$_2$Te$_3$ films was confined to hollow channels present in the films and the transport of charge along them was due to the tunneling across the channels. 73.90 OTHER TOPICS IN ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

67828 Exciton of surface helicons by the method of frustrated total internal reflection. N.N.Beletskii, V.N.Yakovenko (Sci. Res. Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1337-9 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2071-3 (Nov. 1982). [received: April 1983]
Assuming that surface helicons and Alfven waves are excited by the well-known method of frustrated total internal reflection (FTIR), the authors obtain the necessary expressions for the reflection coefficients and find the conditions under which volume electromagnetic waves are converted into surface waves at the boundary of a semiconductor plasma. (11 refs.)

74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

67829 Effects of high pressure-high temperature treatment on the structure composition and superconductivity of $Nb_3(Al,Ge)$. Zhao You-xiang, Liu Zhi-yi (Inst. of Phys., Acad. Sinica, Peking, China), Wang Shou-zheng, Guo Shu-quan.
Acta Phys. Sin. (China), vol.32, no.1, p.108-17 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Alloys of different nominal composition $Nb_3Al_{1-x}Ge_x$ (where $x=0.20$, 0.23, 0.25 containing $A15+\sigma$ phases) have been heat-treated under high pressure up to 67 kbar. With increasing treating pressure, (1) the lattice parameter of A15 phase as well as the I^{211}/I^{210} of relative integral intensity of X-ray diffraction peak (211) and (210) of A15 phase having some concern with structure composition both exhibits a maximum, (2) the structure composition of A15 phase shifts toward the Nb-rich direction, (3) the superconducting transition temperature T_c decreases, while the width of superconducting transition temperature range shows a maximum. (14 refs.)

67830 The superconducting-normal transitions of fast quenched supersaturated solid solution Al- at.% Ge alloy. Chen Xi-Sen, Wang Zu-Lun, Guan Wei-Yan (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.256-8 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The microstructure and superconducting-normal transitions of fast quenched supersaturated solid solution Al-1 at.% Ge alloy have been studied. X-ray structural analysis of the sample indicated that Al-1 at.% Ge alloy consisted of a homogeneous supersaturated *a*-Al(Ge) solid solution. The resistance measurement shows that for solid solution alloy *a*-Al(Ge) $T_c \approx 1.44K$, which is higher than that of pure Al. (7 refs.)

67831 Investigation of the properties of superconducting niobium nitride films. V.M.Pan, V.P.Gorishnyak, E.M.Rudenko, V.E.Shaternik (Inst. of Metal Phys., Kiev, Ukrainian SSR), M.V.Belous, S.A.Koziychuk, F.I.Korzhinsky.
Cryogenics (GB), vol.23, no.5, p.258-62 (May 1983).
Niobium nitride films with a value for T_c of up to 17.3K have been prepared by reactive magnetron and diode sputtering in Ar and N_2 gas mixture. Alteration of T_c and N_2 ion implantation into Nb-N films was studied. It is shown that small doses of implanted ions cause an abrupt decrease of T_c to 12.8K. Annealing at 900°C restores the high T_c. By the tunnel effect, the magnitude of the energy gap is 3.05 MeV at 1.56K for NbN with $T_c=17.1K$ and $2\Delta/kT_c=4.14$. The existence of an undersurface layer has been discovered, whose width is of the order of the coherence length, with a lower T_c of 12.0-12.8K. the superconductivity of this layer above T_c is due to the proximity effect. NbN tunnel junctions are made with a density of the Josephson current $j=(1.7\text{-}2.87)\times10^3 A\ cm^{-2}$. (7 refs.)

67832 T_c measurement of sputter-deposited Nb_3Ge films by a balance-bridge method. M.Suzuki, H.Ouchi, T.Anayama (Dept. of Electrical Engng., Tohoku Univ., Sendai, Japan).
Cryogenics (GB), vol.23, no.5, p.265-6 (May 1983).
T_c values of sputter-deposited Nb_3Ge films were measured using both the balance-bridge method and the four-probe resistance method. (4 refs.)

67833 Niobium: use in super-conducting alloys expands.
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.8 (March 1983).
Discusses the nature of superconductivity and the usefulness of niobium alloys as superconductors. The manufacture of niobium alloys in Japan and elsewhere is described. The use of superconducting alloys in the prototype magnetic levitation train is briefly discussed. (no refs.)

67834 Kobe Steel develops niobium-base superconductor alloys.
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.10 (March 1983).
The development of Nb-Ti-Ta-Zr and Nb_3Sn superconductors is discussed. The manufacturing processes are briefly described. Examples are given of the practical applications of superconducting magnets which use the new alloys. (no refs.)

67835 Effect of anharmonicity and Debye-Waller factor on the superconductivity of PdH_x and PdD_x. R.Griessen, D.G.de Groot (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.699-710 (1982).
On the basis of existing superconducting tunnelling, neutron scattering, electrical resistivity and Raman scattering data and new thermal expansion, elastic moduli and point-contact spectroscopy data it is concluded that the anharmonicity of the proton (deuteron)-palladium potential is such that $M_H\omega_H^2/(M_D\omega_D^2)=1.12\pm0.05$ ($M_{H(D)}$ is the mass and $\omega_{H(D)}$ the frequency of the vibration of hydrogen (deuterium)). This anharmonicity is approximately 2 times too weak to reproduce the observed inverse isotope effect in the superconducting transition temperature of concentrated PdH_x and PdD_x alloys. Within a pseudopotential formalism it is shown that the Debye-Waller factor arising from the large zero-point amplitude of the interstitial hydrogen (deuterium) leads to a contribution to the inverse isotope effect in T_c which is as large as that of anharmonicity alone. (32 refs.)

67836 Superconductivity of hydrides of $Nb_3Au_{0.75}Ir_{0.25}$ and $Nb_3Au_{1-x}Ge_x$. J.Elton, H.Oesterreicher (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.L37-9 (April 1983).
Increases in the superconducting transition temperature T_c as a result of hydriding have been reported previously. In this study, materials are chosen such that under favorable circumstances (a variable hydrogen uptake) a similar increase should become possible. For this purpose $Nb_3Au(T_c\approx11K)$ was partly substituted by $Nb_3IR(T_c\approx2K)$ and $Nb_3Ge(T_c\approx23K)$. (9 refs.)

67837 Enhancement of the superconducting transition temperature T_c in Nb_3Ge by the homoepitaxial technique. Y.Kuwasawa, S.Nakano (Dept. of Phys., Chiba Univ., Chiba, Japan).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.447-9 (4 April 1983).
Nb_3Ge films grown homoepitaxially onto Nb-rich A15 Nb-Ge films have been prepared by the coevaporation method in UHV ($<10^{-6}$ Pa). These homoepitaxial films showed higher T_c and lower lattice parameters in an extended range of composition, 22.8-27.0 at.%Ge, compared with the films deposited directly onto sapphire substrates. (11 refs.)

67838 Semiconductor-superconductor transition in granular Al-Ge. Y.Shapira, G.Deutscher (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).
Phys. Rev. B (USA), vol.27, no.7, p.4463-6 (1 April 1983).
The electrical resistance of granular Al-Ge specimens has been measured for various metal concentrations around the metal-insulator transition. The authors find that, in a narrow range of metal concentrations, the system is semiconducting in the normal state and yet undergoes a superconducting transition. It is shown that the occurrence of the semiconductor-superconductor transition is governed by the interplay between the intergrain tunneling coupling energy, the Josephson coupling energy, and the Coulomb charging energy, and is possible only for granular systems with large enough grains. (11 refs.)

67839 Determination of the critical temperature of the ultrathin metals filaments superconducting transition and its dependence on the filament diameter. V.N.Bogomolov, E.V.Kolla, Yu.A.Kumzerov (A.F. Ioffe Phys.-Tech. Inst., Leningrad, USSR).
Solid State Commun. (USA), vol.46, no.2, p.159-60 (April 1983).
Critical temperature (T_c) of ultrathin filaments (UF) was determined from UF resistance dependence on temperature, using a theoretical description of the fluctuation smeared superconducting transition. T_c vs. diameter (d) was measured for mercury and tin UF with diameters from 20 to 150 Å. The critical temperature of tin filaments increases with diameter decreasing (up to 5.2K) and $T_c(d)$ for mercury UF has a maximum ($T_c^{max}=4.6K$ for $d\simeq40$ Å). (5 refs.)

67840 Anomalous behavior of superconducting transition temperature of amorphous and crystalline Nb_3Ge under pressure. F.S.Razavi, J.S.Schilling (Inst. fur Experimentalphys. IV, Univ. Bochum, Bochum, Germany).
Solid State Commun. (USA), vol.46, no.2, p.197-9 (April 1983).
The superconducting transition temperature (T_c) of amorphous Nb_3Ge was studied under both hydrostatic and quasihydrostatic pressure to 3.5 and 13 GPa, respectively. Whereas hydrostatic pressure causes T_c to initially decrease, T_c is found to increase under higher quasihydrostatic pressures. $T_c(p)$ was also studied on an A-15 crystalline Nb_3Ge sample obtained from the amorphous sample by annealing. (17 refs.)

67841 Effects of a non-separable anisotropic pairing potential on the critical temperature. J.W.Blezius, J.P.Carbotte (Phys. Dept., McMaster Univ., Hamilton, Ontario, Canada).
Solid State Commun. (USA), vol.46, no.2, p.209-13 (April 1983).
Schachinger and Carbotte (1981) have found that a larger concentration of paramagnetic impurities is needed to reduce the critical temperature to zero in an anisotropic superconductor than would be required if the anisotropy was washed out by normal impurity scattering. In the large concentration regime where anisotropy becomes dominant, it is important to know whether the results of Schachinger and Carbotte depend sensitively on their use of a separable model for the anisotropy in the pairing interaction. To settle this question, the authors investigate a simple non-separable model and only minor differences are found. (9 refs.)

67842 The nature of the superconducting state in PbTe doped with thallium. I.A.Chernik, S.N.Lykov, N.I.Grechko (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1661-4 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2931-7 (Oct. 1982). [received: April 1983]
With the aim of explaining the nature of the superconductivity in PbTe(Tl), an experimental investigation is carried out on the linear term in the specific heat, low-temperature Hall coefficient, and critical temperature in PbTe samples containing thallium impurities (0.5 and 1.15 at %) with varying values of the Fermi energy due to doping with additional acceptor impurities (sodium). Analysis of the data indicates that a principal role is played by Tl impurity states in the formation of superconductivity in PbTe(Tl), that these states participate directly in the superconducting transition and that they make a definite contribution to the superconductivity. Also it is found that there is a threshold in the value of the Tl impurity concentration for superconductivity. Possible mechanisms of superconductivity in PbTe(Tl) are briefly discussed. (14 refs.)

74.30 GENERAL PROPERTIES

67843 Size effect of the longitudinal resistivity of multifilamentary superconducting wires. C.Cavalloni, K.Kwasnitza, R.Monnier (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
Appl. Phys. Lett. (USA), vol.42, no.8, p.734-6 (15 April 1983).
Measurements on 22 different conductor samples, and numerical calculations based on Chambers' kinetic formulation show conclusive evidence for the existence of a substantial size effect on the longitudinal resistivity of multifilamentary superconducting wires in the normal state. This may have important consequences for the design of such conductors. (4 refs.)

67844 Influence of the normal phase concentration and morphology on the superconductor flow stress. V.I.Dotsenko, V.A.Sirenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.412-18 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The flow stress as a function of the normal phase concentration in superconductors has been studied. The essential differences in these dependences between types I and II superconductors that were found are associated with the normal phase morphology differences. (24 refs.)

67845 Size effects on electron transport in multifilament superconducting wires. C.Cavalloni, R.Monnier (Lab. fur Festkorperphys. ETH, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.669-74 (1982).
Numerical results are presented for the longitudinal and transverse resistivity of multifilamentary superconducting wires in the normal state, as a function of the bulk mean free path in the matrix material, the radius of the filaments and the distance between them. Size effects are seen to play an important role in the range of parameters characteristic of technical superconductors. (8 refs.)

67846 Structure and magnetic properties of localised superconductive states. B.Ya.Shapiro (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
J. Phys. F (GB), vol.13, no.5, p.L83-7 (May 1983).
The magnetic properties of a space-inhomogeneous superconductor with plane metal inhomogeneities are investigated. The superconductive states are localised by an external magnetic field along the latter. Such localised states form a periodic space lattice with a square or triangular unit cell. (8 refs.)

74.30C Magnetization curves, Meissner effect, penetration depth

67847 Magnetic anisotropy in the organic superconductor $(TMTSF)_2ClO_4$. K.Andres, H.Schwenk (Walther-Meissner-Inst. fur Tieftemperaturforschung, Bayerischen Akad. Wissenschaften, Garching, Germany).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.675-87 (1982).
Electrochemically produced crystals of $(TMTSF)_2ClO_4$ grow with different morphologies, which exhibit different mechanical properties. The thinnest, needle-shaped samples prove to be particularly good single crystals and exhibit typical whisker properties. Measurements of the Meissner effect in the superconducting state of such crystals show high anisotropies both in the critical field and the 'pinning' force. (14 refs.)

67848 Spin density wave and superconductivity in highly anisotropic materials. IV. Electromagnetic properties of the coexistence phase. K.Machida (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1333-40 (April 1983).
The coexistence state of the spin density wave due to the itinerant electrons and superconductivity is further studied focusing on its electromagnetic properties within the same simple electron band model as used previously by the author. Anisotropic penetration depth and static electronic susceptibility are calculated. A brief discussion of recent far-infrared transmission experiments on $(TMTSF)_2ClO_4$ at low temperatures is given.

67849 Films and surfaces of ferromagnetic superconductors. M.Tachiki, T.Koyama, S.Takahashi (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.43-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The ternary compounds such as $(RE)Rh_4B_4$ and $(RE)Mo_6S_8$ contain magnetic rare earth ions RE at the regular lattice sites, nevertheless they show superconductivity. In the superconducting state of films and surfaces of these compounds, the interplay between magnetism and superconductivity causes the following unusual phenomena: the magnetization bound within the London penetration depth from the surface appears below a critical temperature. In the films various types of magnetic order coexisting with superconductivity appear depending on the film thickness. The anomalous behavior of the Josephson effect in ferromagnetic superconductors is briefly discussed. (18 refs.)

67850 Superconducting and magnetic properties of $Y_{0.9}R_{0.1}Rh_4B_4$. H.B.Radousky (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA), A.T.Aldred, G.S.Knapp, J.S.Kouvel.
Phys. Rev. B (USA), vol.27, no.7, p.4236-42 (1 April 1983).
The magnetisation, susceptibility, heat capacity, and upper critical field (H_{c2}) versus temperature (T) curves have been determined for the $Y_{0.9}R_{0.1}Rh_4B_4$ system with R=Gd, Dy, Ho, Er, and Tm. These materials allow the effects of the different magnetic rare earths on the superconducting properties of the host material to be studied at a dilute concentration, where no long-range magnetic order has been observed. The Ginzburg-Landau parameters ξ_{GL} and λ_{GL} have been obtained from the values of the heat-capacity coefficient γ, $(dH_{c2}/dT)(T=T_c)$, and T_c. These parameters, which are derived from the data near T_c and at low fields, are relatively insensitive to the particular rare-earth ion. At higher values of $H/T(\approx 1$ kOe/K) the H_{c2}-vs-T curves show dramatic differences which can be correlated with the type of order (superconducting or ferromagnetic) that occurs in the RRh_4B_4 compounds. For R=Gd, Dy, and Ho, which order ferromagnetically in the concentrated compounds, the curves are seen to bend over sharply with increasing H/T, whereas for R=Er and Tm, which are superconducting in the concentrated compounds, the H_{c2}-vs-T curves are very similar to that of nonmagnetic YRh_4B_4. In addition, the critical-field curves show that the crystal fields strongly affect the response of the rare-earth ions in a magnetic field, which in turn determines the magnetic transition temperatures of the RRh_4B_4 compounds. (23 refs.)

74.30E Thermodynamic properties; thermal conductivity

67851 Kinetic properties of anisotropic superconductors with impurities. O.P.Bezzub, M.E.Palistrant.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.357-67 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The thermoelectric power η_s and the thermal electric conductivity K_s of a superconductor with paramagnetic impurities near the electronic topological transition (when a flattened spot appears on the Fermi surface) are studied theoretically. The equality of the ratio η_s/η_n and K_s/K_n in such systems is proved. The enhancement of the thermoelectric power by several orders at the electronic topological transition and the additional enhancement connected with electron exchange scattering on the impurity in superconductors are received. The possibility of the enhancement by several orders of magnetic flux Φ_T (connected with the temperature gradient) in a bimetallic loop is indicated. The ratio $\eta_s/\eta_n=K_s/K_n$ and the order parameter Δ/Δ_0 are found as functions of the pressure, concentration of impurity and temperature. (11 refs.)

67852 Topological excitations and specific-heat anomalies in 2D superconductors. C.Di Mauro (Centro Siciliano di Fisica Nucleare e di Struttura della Materia, Catania, Italy), G.Giaquinta.
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.16, p.539-43 (16 April 1983).
The authors show that the reconsideration of the specific heat data obtained by Rao et al. (1980) on amorphous Nb_3Ge superconducting thin films below T_c, and as yet uninterpreted in terms of the Kosterlitz-Thouless-Berezinskii transition phenomenon, leads to the recognition of the occurrences of vortex-antivortex pair dissociation in 2D superconductors low normal-state resistance. The authors' approach does not contain adjustable parameters. The differences between the calculated value of the Kosterlitz-Thouless-Berezinskii transition temperature (2.45K) and the value reported by Rao et al.(2.54K) is within the uncertainty limit (~3%). The characterisation of a phase transition through the temperature dependence of a static thermodynamic quantity is a more basic physical criterion than an as yet theoretically controversial nonequilibrium process. (31 refs.)

67853 Low temperature specific heat of ZrN_x [superconducting]. V.A.Lovchinov (Inst. of Solid State Phys., Sofia, Bulgaria), H.Madge, A.N.Christensen.
Phys. Scr. (Sweden), vol.27, no.3, p.207-10 (March 1983).
The low temperature specific heat of a series of ZrN_x samples (x=1.01; 0.93; 0.88; 0.74) has been measured in the temperature intervals 2-10 and 2-15K. For the superconducting samples, measurements in a magnetic field of 20 kOe were perfomed. Using the data, the coefficients of the electron specific heat γ, the Debye temperatures θ_D, the critical temperatures T_c, the density of states $N(0)$ at the Fermi level, the electron-phonon coupling terms λ, and the dependence of these parameters on the nitrogen concentration in the samples were determined. 74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

67854 Subharmonic generation in Josephson junction fluxon oscillators biased on Fiske steps. M.P.Soerensen, P.L.Christiansen, R.D.Parmentier, O.Skovgaard (Lab. of Appl. Math. Phys., Tech. Univ. of Denmark, Lyngby, Denmark).
Appl. Phys. Lett. (USA), vol.42, no.8, p.739-41 (15 April 1983).
Numerical integration of the perturbed sine-Gordon equation describing a long overlap-geometry Josephson junction in a magnetic field indicates a branched structure of the first Fiske step. The major portion of the step corresponds to a simply periodic fluxon oscillation whereas the branches are characterized by subharmonic generation. (9 refs.)

67855 Tunnelling between two superconductors separated by a double Schottky barrier. I.Janetka (CEFV SAV, Bratislava, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.2, p.93-104 (1983).
The tunnelling probability through tunnel junctions between two superconductors or metals separated by a double Schottky barrier is calculated in the WKB approximation. Further, the expression for the tunnel current is derived and its dependence on the applied voltage is numerically calculated for a Pb-CdS-Pb system at various temperatures. It is shown that the energy gap of superconductors (and mainly its changes, e.g. by temperature) can be measured not only from the steep increase of current at V-$2\Delta/e$, but also at larger voltages, determined by the appearance of the resonance tunnelling through the double barrier. (9 refs.)

67856 Frequency-dependent properties of a microbridge-coupled superconductor in a magnetic field of two frequency components. T.Ishida, H.Mazaki (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L141-3 (March 1983).
Applying a mixing magnetic field $h_1 \sin 2\pi f_1 t + h_2 \sin 2\pi f_2 t$ to a microbridge-coupled Tc specimen, the authors have measured the AC susceptibility $\chi_1=\chi_1'-i\chi''_1$ through frequency channels of f_1 and f_2. Observations show the

f_2 dependence of χ''_1, where f_1 is fixed, i.e. the transitions in terms of $\chi''_1(f_1)$ and of $\chi''_1(f_2)$ occur at different temperatures. It has been revealed that the magnetic susceptibility approaches an asymptotic form as f_2 increases. (8 refs.)

67857 Macroscopic quantum tunnelling in Josephson junctions. A.A.Golub, V.P.Iordati.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.350-6 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The dissipation effect upon the macroscopic quantum tunnelling in Josephson junctions has been studied. It is shown that friction can lead to prolonged lifetime of metastable state of the junction. It is found that clear separation of pure quantum mechanical friction-free and dissipation-involving tunnelling probabilities is only possible for small friction. (14 refs.)

67858 Temperature dependence of the excess resistance of a system of S-N boundaries. Yu.G.Bevza, A.V.Lukashenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.368-72 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The authors propose a simple method to produce thin film structures with alternating superconducting and normal layers. The temperature dependence of the excess resistance of a system of *S-N* boundaries is studied. The version of the Artemenko-Volkov theory which allows for the conductivity difference between superconducting and normal metals is shown to be able to account for experimental results sufficiently well. (14 refs.)

67859 Electron-phonon interaction in superconducting contacts. V.A.Khlus, A.N.Omelyanchuk.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.373-84 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The current-voltage characteristic is found for the superconducting point contact whose size a is smaller than all the characteristic lengths $a \ll \xi(0)$, l, ${}^{v\mathrm{F}}/_{\omega \mathrm{D}}$ (l is the impurity-induced scattering length, $\xi(0)$-the superconducting coherence length). In the region of the site a near the contact where a strong electric field exists, quasi-particles emit nonequilibrium phonons. As a result, the current-voltage characteristic displays specific features connected with the position of the maxima of the electron-phonon interaction function $G(\omega)$ (an analogue of the Eliashberg function taking into account the contact geometry). The excess current existing at high voltages $eV \gg \Delta$ decreases with a growth of V, its derivative $dI_{\mathrm{ex}\odot}/dV$ being proportional to the function $G(\omega)$ which is somewhat different from the point contact function of the electron-phonon interaction for a normal contact. (13 refs.)

67860 Superconducting critical fields of copper in proximity with Nb-Ti. A.C.Mota, D.Marek, J.C.Weber (Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.647-54 (1982).
The authors report the first measurements of magnetization curves of superconducting 10-20 μm thick copper in proximity with niobium-titanium. Very sharp first order transitions are observed at the breakdown fields H_b. From the temperature dependence of H_b, it seems that the pair penetration depth in copper is not limited by the electronic mean free path even at $T=5$ mK. (5 refs.)

67861 Frequency dependence of charge imbalance relaxation and boundary resistance at the superconductor-normal metal boundary. B.A.Mattoo, Y.Singh (Dept. of Phys., Univ. of Kashmir, Srinagar, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.938-41 (Dec. 1982). [received: April 1983]
Using the generalized two-fluid picture for the charge of a superconductor, the frequency dependence of the charge imbalance relaxation rate and the boundary resistance at the N-S interface are calculated. The former is in agreement with the result obtained by microscopic techniques. The latter shows a detectable effect in the microwave region. (16 refs.)

67862 Power dwell using vortex flow of long Josephson junctions. S.B.Kaplan (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.10, p.5065-7 (March 1983).
Shows that vortex flow in a long Josephson junction may be used to provide power dwell, needed to minimize the punchthrough problem, without the need for auxiliary circuits. (no refs.)

67863 Phonon spectrum analyzer. T.V.Rajeevakumar (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.10, p.5083-4 (March 1983).
Shows that phonons injected at one end of a superconductor are selectively attenuated under certain conditions related to their energy levels and the conditions of the superconductor, and thus an array of several superconductors with an array of differing related energy gaps may provide a wide-range phonon spectrum analyzer. (no refs.)

67864 Electronics poised for quantum leap. D.Madden.
Infomatics (GB), vol.4, no.4, p.44-5 (April 1983).
Describes the research work of a team of scientists at Sussex university which has produced results that threaten to revolutionalise conventional electronics. The team has built an artificial atom which exhibits the precise behaviour of a single atom implicit in the theories of quantum mechanics. These advances will enable physicists to investigate the behaviour of single atoms in different energy states (how atoms jump from one state to another) and could signal a new type of electronic circuitry within which signals travel faster than the speed of light. (no refs.)

67865 Microscopic quantum tunneling in Josephson junctions. A.A.Golub, V.P.Iordatii (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).
JETP Lett. (USA), vol.36, no.6, p.227-30 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.184-7 (20 Sept. 1982). [received: April 1983]
The effect of dissipation on microscopic quantum tunneling in Josephson junctions is studied. It is shown that dissipation increases the lifetime of the metastable state of the junction. It is found that the tunneling probability can be clearly separated into quantum-mechanical tunneling in the absence of dissipation and dissipation-related tunneling only for small dissipation. (11 refs.)

67866 Measurements of g-factor and exchange integral J in $Hg_{1-x}Mn_xTe$ by means of tunneling. A.Okoniewski (Inst. of Phys., Tech. Univ. of Poznan, Poznan, Poland), J.Rauluszkiewicz.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.14-16 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
In dynamic conductivity dI/dV vs. V of tunnel junctions $HgMnTe/Al_2O_3/Pb$ the peaks at $V=0$ in low magnetic fields and the dips in higher fields are observed. These zero bias anomalies (ZBA) are interpreted in terms of interaction between tunneling electrons and magnetic moments of Mn ions. From the dependence of ZBA on magnetic field the g-factor vs. H and the exchange integral J have been deduced. (7 refs.)

67867 Magnetic properties of voided superconductors in strong magnetic fields ($H \gtrsim H_{c2}$). V.N.Rud'ko, V.I.Sugakov.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.440-3 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The properties of superconducting regions localized near vacancy voids in type-II superconductors are investigated in the case of magnetic fields exceeding the second critical field. The dependence of the third critical field $H_{c3}(R)$ at which such regions appear on the void radius is obtained. This dependence is not monotonous, the amplitude of oscillations decreases when the void radius increases and $H_{c3}(R)$ tends to the plane surface value H_{c3}. Magnetic momentum caused by the appearance of superconducting regions also depends on magnetic field unmonotonously. It is shown that in the magnetic field range under consideration $(H)_{c2} < H < H_{c3}(R)$ the significant diamagnetic effect must be observed in real voided superconductors. (10 refs.)

67868 Superconducting parameters of a strongly anisotropic intercalated TaS_2 compound: $K_{0.33}(H_2O)_{0.66}TaS_2$. S.Gygax, W.Biberacher, A.Lerf (Walther Meissner Inst. fur Tieftemperaturforschung Bayerischen Akad. Wissenschaften, Garching, Germany), M.Denhoff.
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.755-63 (1982).
Electrochemically intercalated $K_{0.33}(H_2O)_{0.66}TaS_2$ crystals show a strong temperature dependent anisotropy of H_{c2} rising from 33 near T_c to well over 60 at lower temperatures. The coherence distances are determined to be $\xi_{\parallel}(0)=2.95 \times 10^{-6}$ cm and $\xi_{\perp}(0)=9.0 \times 10^{-8}$ cm. Penetration depths were estimated from low field measurements to be $\lambda_{\parallel}(0)=3.4 \times 10^{-4}$ cm and $\lambda_{\perp}(0)=7.1 \times 10^{-3}$ cm. An anomaly in the angular dependence of the entrance field H_{en} and trapped flux near parallel applied fields is found, qualitatively similar to what was observed in $NbSe_2$. (6 refs.)

67869 Locked and unlocked phases of a two-dimensional lattice of superconducting vortices. P.Martinoli, M.Nsabimana, G.A.Racine, H.Beck (Inst. de Phys., Univ. de Neuchatel, Neuchatel, Switzerland).
Helv. Phys. Acta (Switzerland), vol.55, no.6, p.655-8 (1982).
The flux lattice in a thin film of a type II superconductor, whose thickness is periodically modulated, allows for an investigation of various phase transitions typical of two-dimensional systems. The authors present a continuum approach in which the mismatch δ between the equilibrium lattice structure and the spacial period of the modulation plays a major role. In the ground state the lattice is locked by the modulation potential when δ is small, whereas for large enough δ the lattice is freely floating, its structure showing periodic discommensurations. A phase diagram in the (δ,T)-plane can be established by taking into account thermal fluctuations. Critical current data at various temperatures show good agreement with the theoretical predictions. (16 refs.)

67870 Ferromagnetic pinning of superconducting fluxoids at the contact between Sn and Gd films. R.Aoki, M.Katashiro (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.17-18 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
To investigate the magnetic interaction of superconducting fluxoids with magnetic substances, coaxial multilayer samples are prepared by alternate deposition of two or three superconducting Sn or Pb (Tl) films of $2\text{-}3 \times 10^3$ Å and magnetic Gd or Y of $(4 \pm 1) \times 10^2$ Å. The measured superconducting critical current with perpendicular magnetic field H was enhanced more than ten times by the magnetic contact, and attained a value of 1.4×10^5 Acm^{-2} at $H=0.5$ kOe, $T=4.2$K for Pb (Tl). However, no significant difference in the effect between Gd and Y was observed. (5 refs.)

74.60J Critical currents

67871 Influence of repeated heat treatment on critical current density of Nb-50 wt.%Ti alloy superconductors. A.Nagata, S.Hanada (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), S.Den, O.Izumi.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.343-50 (April 1983). In Japanese.
The improvement of the critical current density (J_C) of a Nb-50 wt.%Ti alloy in high magnetic fields by means of repeated heat treatment and cold working has been studied from a metallurgical viewpoint. The cycle of heat treatment and working is found to be effective in improving J_C. The final drawing after intermediate heat treatment enhances J_C, especially in high magnetic fields. The fine dislocation network structure introduced by the final drawing

after heat treatment may be responsible for the increment of J_C in higher magnetic fields. (26 refs.)

67872 **Random-field induced interface widths in Ising systems.** K.Binder (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Z. Phys. B (Germany), vol.50, no.4, p.343-52 (1983).
A d-dimensional Ising system with interaction J at zero temperature in random fields $\pm h$ is considered, where due to boundary conditions an interface between states of positive and negative magnetization is maintained over a cross-section L^{d-1}. The root mean square interface width $w(L, h)$ is found to behave as $w(L, h) \propto (h/J)^2 L (d=2)$ and $w(L, h) \leq L \exp [-\text{const}(J/h)^2]$ $(d=3)$. For $d=2$the interface energy is negative for $L \rightarrow \infty$, and hence domains form spontaneously. Nonzero temperatures are discussed qualitatively, and consequences for the interpretation of experiments on random-field systems are outlined. For $d=2$ and nonzero temperatures the author's treatment agrees with recent results of Grinstein and Ma (1982) and Villain (1982). (33 refs.)

67873 **Numerical solution of the mean-field theory of the ANNNI model in an external field: a comparison of two methods.** H.C.Ottinger (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).
J. Phys. A (GB), vol.16, no.7, p.1483-9 (11 May 1983).
It is shown how the solution of the mean-field equations for the ANNNI model can be reduced to the iteration of an area-preserving two-dimensional mapping if an external magnetic field is applied. This method is analysed in detail and compared with the exact numerical solution of the mean-field equations for simple periodic magnetisations. (19 refs.)

67874 **The Yang-Lee edge singularity in one-dimensional Isung and N-vector models.** D.A.Kurtze (Phys. Dept., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Stat. Phys. (USA), vol.30, no.1, p.15-35 (Jan. 1983).
The distribution of zeros of the partition function in the complex magnetic field plane is studied for linear chains of n-vector spins and finite-width strips of Ising spins with nearest-neighbor interactions. By means of transfer matrix/operator techniques, the exponent σ characterizing the behavior of the density of zeros near the Yang-Lee edge is shown to have the exact value $\sigma=-1/2$ (i) analytically for n-vector chains in the high-temperature limit and for Ising strips in the low-temperature limit, and (ii) numerically for intermediate temperatures. The crossover of σ from its n-vector value to its spherical model value, $\sigma=1/2$, as $n \rightarrow \infty$, as well as from $d=1$ to $d=2$ Ising as the width of the strips increases, seems to proceed by an accumulation of branch points in the spectrum of the transfer operator; for the n-vector models the position of the gap edge and the free energy at the edge approach their spherical model values with corrections of order $1/n^{\zeta}$ with $\zeta \simeq 3/4$. (32 refs.)

67875 **The isothermal and frequency-dependent perpendicular susceptibilities of the one-dimensional alternating Ising model.** L.L.Goncalves (Dept. de Fisica, Univ. Federal do Ceara, Ceara, Brazil).
Solid State Commun. (USA), vol.46, no.5, p.375-7 (May 1983).
Exact expressions for the isothermal and frequency-dependent perpendicular susceptibilities are obtained for the alternating Ising model in an external longitudinal field. It is shown that even for vanishing field the isolated perpendicular susceptibility is identical to the isothermal one. It is also obtained the longitudinal wave-vector dependent susceptibility, and the results are compared with the known ones. (8 refs.)

67876 **The constant-coupling approximation: some exact results.** J.Katriel, G.F.Kventzel (Dept. of Chem., Technion-Israel Inst. of Technol., Haifa, Israel).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K51-6 (1 March 1983).
The limiting behaviour of the constant coupling approximation (CCA), as $z \rightarrow \infty$, is examined in full generality, establishing rigorously that it reduces to the Weiss-Heisenberg (WH) theory. Furthermore, the behaviour of the effective field is examined and some of its properties are derived. In particular, the

limiting behaviour as T→0 and as $T \to T_c$ is investigated, and some results are obtained in an analytic form. These results are preceded by a concise statement of the principal equations of the CCA. (16 refs.)

67877 Electron structure and magnetic state of rare-earth compounds with a weak exchange interaction. A.I.Mitsek, K.Yu.Guslienko, S.V.Pavlovskii (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1570-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2773-81 (Sept. 1982). [received: April 1983]
The energy spectrum of electrons in narrow bands of transition elements, in particular, rare-earth metals, are calculated within the framework of many-body theory. The Hubbard intraatomic Coulomb repulsion, an anisotropic crystal field, and the exchange and Zeeman energies are considered. The positions of many-electron energy bands and their widths are evaluated using an effective spin Hamiltonian. The separation between the bands and the dispersion law of electrons are determined by the total angular momentum J of the electron shell of a rare-earth atom and by the projection m of the total angular momentum $\mathbf{J}_f$ on the quantization axis. The width of a band is proportional to m and to an exchange integral I. Interband transitions are associated with excitons, magnons, and multiplet waves. Magnetic phase diagrams are determined for various signs of the coefficient K_1 of an irreducible tensor operator of the lowest order (the magnetic anisotropy constant K_1 of a uniaxial crystal containing rare-earth elements). The magnetization curves in the limit of a weak exchange (compared with the anisotropy) are calculated. It is shown that the magnetization curves are continuous for an arbitrary orientation of the magnetic field. It is predicted that the relative spontaneous magnetization exhibits an oscillatory dependence on the number of magnetic electrons (on J). Saturation orientation phase transitions and order-disorder transitions are also studied in the mean-field approximation. (27 refs.)

75.20 DIAMAGNETISM AND PARAMAGNETISM

67878 Temperature dependence of the magnetic susceptibility of almost-ferromagnetic materials. D.R.Grempel (Dept. of Phys., Univ. of Maryland, College Park, MD, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4281-7 (1 April 1983).
Presents a microscopic calculation of the magnetic susceptibility of exchange-enhanced materials based on the paramagnon model for the interaction of electrons with spin fluctuations. By explicitly calculating the vertex corrections, the author finds that, in a spin-conserving approximation, the low-temperature magnetic susceptibility contains anomalous logarithmic corrections that account for the maximum in $\chi(T)$ observed in many materials. This is the result expected on the basis of phenomenological Landau theory. The results, which are not limited to low temperatures, show that at temperatures above the spin-fluctuation temperature the inverse susceptibility increases almost linearly with T, in agreement with spin-fluctuation theories. (13 refs.)

67879 Field dependences of magnetisation and specific heat coefficient in a nearly magnetic system: Liquid ^{3}He and strong Pauli paramagnets. M.T.Beal-Monod, E.Daniel (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).
Phys. Rev. B (USA), vol.27, no.7, p.4467-70 (1 April 1983).
The authors analytically derive the first-order magnetic field dependences of the magnetisation M and of the coefficient γ of the specific heat, in a nearly magnetic paramagnet, at low temperature. (17 refs.)

67880 Influence of magnetic field on the development of magnetic anisotropy in a magneto-electret of shellac wax. M.L.Maji, S.D.Chatterjee (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.986-7 (Dec. 1982). [received: April 1983]
Fluctuation of magnetic anisotropy as a function of the forming magnetic field has been observed, in a shellac wax magneto-electret. It has been explained by the existence of paramagnetic anisotropy developed by trapped ions in the magneto-electret state together with the diamagnetic anisotropy of the molecules. (10 refs.)

67881 Magnetic properties of solid solutions of the system β-USe_2-UTe_2. A.V.Pechennikov, V.K.Slovyanskikh, V.I.Chechernikov, N.T.Kuznetsov, N.V.Gracheva, V.M.Golubev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.5, p.738-9 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.877-9 (May 1982). [received: Feb. 1983]
Presents the results of a study of the magnetic properties of solid solutions of $USe_{2-x}Te_x$ and the compounds UTe_2 and β-USe_2. The magnetic susceptibility was studied in the temperature interval 77-600K. The variation in the magnetic susceptibility of the solid solution $USe_{2-x}Te_x$ follows the Curie-Weiss law. From graphs of the dependence of $1/\chi$ on T (where χ is the paramagnetic susceptibility and T is the temperature in K), the authors determined the paramagnetic Curie temperature θ_p and the effective magnetic moment μ_{eff} at the uranium atom. (8 refs.)

67882 The γ-α transition in cerium compounds. M.Lavagna, C.Lacroix, M.Cyrot (Lab. Louis Neel, CNRS, Grenoble, France).
J. Phys. F (GB), vol.13, no.5, p.1007-15 (May 1983).
The γ-α transition and the related volume collapse are explained within a compressible Kondo lattice where the variation of $|J|/D$ with volume is taken into account. The authors show that, contrary to the promotion model, the Kondo contribution is sufficient to induce a first-order transition at low temperature from a magnetic to a Kondo phase. The α phase is then characterised by an extremely high Kondo temperature. The calculations are also made at zero and finite temperatures and the existence of a critical point is demonstrated. Finally, they propose a generalisation to the effect of a chemical pressure. Applications are made to Ce, $CeAl_2$ and $Ce_{1-x}Th_x$. (21 refs.)

67883 Magnetic properties of thorium and uranium borides and $U_{1-x}Th_xB_4$ solid solutions. Z.B.Chachkhiani, L.G.Chachkhiani, V.I.Chechernikov, V.K.Slovyanskikh (V.I. Lenin Polytech. Inst., Georgian SSR).
Sov. Phys. J. (USA), vol.25, no.7, p.621-8 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.45-8 (July 1982). [received: May 1983]
The dependence of the magnetic susceptibility on the temperature in the compound UB_4 and system $U_{1-x}Th_xB_4$ has been studied in the temperature range 140-1300K. It has been established that the paramagnetic susceptibility does not obey the Curie-Weiss law. The experimental results are interpreted on the basis of the Stoner model of collectivized electrons which also makes it possible to explain the magnetic properties of other borides of thorium and uranium. 75.20E Metals and alloys

67884 Vector potential induced diamagnetism and flux quantization in normal metals. E.N.Bogachek, I.O.Kulik.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.398-402 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
Diamagnetic susceptibility of a bulk normal metal single crystal with cylindrical cavity is shown to oscillate as a function of magnetic flux penetrating the cavity $\Phi = HS$ (S being the cross section of the cavity) perpendicular to H with the period $\Phi_0 = hc/e$. Similar effects take place if a small solenoid producing vector potential field in the metal is inserted inside the cavity. The magnitude of the oscillating component of the magnetic moment in the metal is of the order of magnitude $(\Phi_0/HR_0{}^2)\ M_{\mathrm{HVA}}{}^{\mathrm{OC\Pi}}$ where $M_{\mathrm{HVA}}{}^{\mathrm{OC\Pi}}$ is the magnitude of the de Haas-van Alphen effect and R_0 the sample diameter. (14 refs.)

67885 High temperature magnetic susceptibility of the Nb-H system. J.-M.Welter (Inst. fur Festkorperforschung, KFA, Julich, Julich, Germany), H.Lilienthal.
J. Less-Common Met. (Switzerland), vol.90, no.2, p.291-7 (April 1983).
The magnetic susceptibility $\chi(T,x)$ of various NbH_x specimens with $0 \le x \le 0.8$ was measured in the temperature range $275K \le T \le 475K$. The susceptibility of the solid solution decreases from 2.84×10^{-5} to 1.25×10^{-5} $cm^3\ g^{-1}$ in this hydrogen concentration range and exhibits a marked break at $x \approx 0.6$. An estimate of the Pauli paramagnetic spin susceptibility χ_P for the two limiting concentrations allowed the evaluation of the orbital paramagnetic susceptibility χ_O. For $x=0$ and $x \approx 0.8$ the values of χ_P are 1.05×10^{-5} $cm^3\ g^{-1}$ and 0.39×10^{-5} $cm^3\ g^{-1}$ respectively and the values of χ_O are 1.73×10^{-5} $cm^3\ g^{-1}$ and 1.08×10^{-5} $cm^3\ g^{-1}$ respectively. The magnetic susceptibility decreases by approximately 10% on going from the concentrated solid solution to the monohydride. (23 refs.)

67886 Disordered local moment state of magnetic transition metals: a self-consistent KKR CPA calculation. A.J.Pindor (Cavendish Lab., Cambridge Univ., Cambridge, England), J.Staunton, G.M.Stocks, H.Winter.
J. Phys. F (GB), vol.13, no.5, p.979-89 (May 1983).
The authors perform self-consistent KKR CPA calculations for the disordered local moment (DLM) state of Fe, Co, Ni and Cr at different temperatures. The DLM state is a model for the metals above their Curie temperatures, in the paramagnetic state. They find the dependence of the local magnetic moment on temperature and determine the Stoner temperature. For Fe, they obtain the magnitude of the local moment above the Curie temperature to be about 85% of the ground-state value, whereas for Co and Ni it is about 50% of the ground-state value. For Cr they find that no self-consistent local magnetic moment exists in this DLM state. With slightly increased lattice spacing the sizes of the local moments are found to increase for both Fe and Ni. (21 refs.)

67887 A real-space method for the calculation of the orbital susceptibility of simple metals and transition metals. J.Benkowitsch, H.Winter (Kernforschungzentrum Karlsruhe, Karlsruhe, Germany).
J. Phys. F (GB), vol.13, no.5, p.991-1005 (May 1983).
A real-space method for the calculation of the orbital susceptibility, χ_0, of electrons in metals is developed. The authors express this quantity in terms of integrals over the spatial arguments of correlation functions and write χ_0 as the sum of the following three contributions: the Langevin diamagnetism, the Van Vleck paramagnetism and a term which yields the Landau diamagnetism in the limit of free electrons. The evaluation of χ_0 for the free-electron gas as a test case for the Al, Nb, V and Mo demonstrates its applicability to both simple and transition metals. In this work the Landau term for transition metals is calculated separately for the first time. They show that it provides an appreciable paramagnetic contribution in the cases of Nb and V. (36 refs.)

67888 Magnetic susceptibilities of liquid binary alloys. M.Iwamatsu, S.K.Lai, R.A.Moore, S.Wang (Univ. of Waterloo, Waterloo, Ontario, Canada).
J. Phys. F (GB), vol.13, no.5, p.1027-40 (May 1983).
A description of the concentration dependence of the magnetic susceptibilities of a number of liquid binary alloys of simple metals is effected in three stages. First, a previous pseudopotential formalism is extended to enable the calculation of the conduction electron diamagnetic susceptibilities in the pure liquid metals, Li, Na, K, Rb, Cs, In and Pb. These results are then combined

with much earlier calculated values of the diamagnetic susceptibilities of the core electrons and with observed values, existing in the literature, of the total magnetic susceptibilities to infer the conduction electron paramagnetic susceptibilities of the above pure liquid metals. Second, the expressions for the two diamagnetic contributions are modified permitting the determination of their concentration dependence in a number of nearly-free-electron (NFE) like liquid binary alloys. The Landau theory of a Fermi liquid is used to infer the concentration dependence of the paramagnetic contribution. Third, Li-Pb, which is not NFE like over the entire concentration range is treated separately as a special but closely related case. The observed results for the concentration dependence of the total magnetic susceptibility are favourably reproduced, both for those alloy systems exhibiting smooth variations and for those with large variations. (34 refs.)

67889 Unusual paramagnetism of FeSi: experiment. H.Miyajima.
Solid State Phys. (Japan), vol.18, no.1, p.1-12 (Jan. 1983). In Japanese.
The magnetic properties of FeSi are reviewed from experimental points of view. It is also shown that most of them can be explained by using spin fluctuation theory developed by Moriya (1978) and others. (50 refs.)

67890 Unusual paramagnetism of FeSi: theory. Y.Takahashi.
Solid State Phys. (Japan), vol.18, no.1, p.13-18 (Jan. 1983). In Japanese.
The magnetic properties of FeSi are briefly reiewed from theoretical points of view with particular attention paid to the temperature induced local moment at high temperature. (15 refs.)

75.20H Local moment in dilute alloys; Kondo effect

(see also 72.15Q Electronic conduction)

67891 The double impurities scattering theory for 'the resistance maximum' phenomena in the dilute magnetic alloys. Wang Chung-chen, Liu Fu-siu (Dept. of Phys., Peking Univ., Peking, China).
Acta Phys. Sin. (China), vol.32, no.1, p.33-45 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Based on s-d interaction, the authors consider RKKY interaction existing between two magnetic impurities, and propose a new double impurities scattering model. According to this model, when an impurity spin makes spin flip scattering, its spin as an inner free degree will be confined by other impurities' spin, where the RKKY correlation exists between them. Because of this correlation, it will suppress its spin flip scattering. This suppression, coupled with the Kondo log$T$ term, causes a local maximum. They have calculated all possible 'DIS' diagrams (the double impurities self-energy diagrams) and found a term $A/(T_0{}^2-T^2)$ contribute to the Kondo resistance, where A is a positive constant, T_0 is some critical temperature. When $T\leq T_0$, this formula is meaningless. (19 refs.)

67892 Simple scaling behaviour in the magnetic susceptibility of $CeSn_3$ under high pressure. S.A.Shaheen, J.S.Schilling (Experimentalphys. IV, Univ. Bochum, Bochum, Germany), S.H.Liu, O.D.McMasters.
Phys. Rev. B (USA), vol.27, no.7, p.4325-35 (1 April 1983).
The static magnetic susceptibility χ of single-crystalline $CeSn_3$ is measured as a function of temperature $3\leq T\leq 300K$ and hydrostatic pressure 1 bar$\leq P\leq 15$ kbar. The temperature and pressure dependence of χ is shown to be a function of a single characteristic spin-fluctuation energy kT_{sf}, i.e. χT scales with T/T_{sf}. From the magnitude of the increase of T_{sf} with pressure ($\partial \ln T_{sf}/\partial P\simeq +1.4\%$/kbar or $\partial \ln T_{sf}/\partial \ln V\simeq -7.6$) it can be indirectly inferred within a simple model that an increase in the 4f hybridisation width Δ, rather than a decrease in the 4f binding energy ϵ_{ex}, is the dominant change in the magnetic state under pressure. These results imply that $CeSn_3$ would be best characterised as a trivalent Ce compound with a rather high spin-fluctuation temperature ($T_{sf}\simeq 200K$) rather than as a compound with fractional valence. $\chi(T)$ appears to depend only very weakly on the relative orientation of the magnetic field. The Curie tail in $\chi(T)$ below 20K is independent of pressure and is, therefore, very likely an impurity effect rather than an intrinsic property of the compound. It is suggested that scaling itself can be used to derive changes in both the valence v and T_{sf} in a single experiment. (37 refs.)

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

67893 Magnetic defects in antiferromagnetically ordered $Mn_{1-n}Zn_nF_2$ mixed fluorides. E.Bakshi, T.J.Hicks (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).
J. Phys. C (GB), vol.16, no.12, p.2337-50 (30 April 1983).
The authors have measured magnetic diffuse elastic cross sections for the $Mn_{1-n}Zn_nF_2$ system at 4.2K and for one composition at 25K. Neutron polarisation analysis with a time-of-flight technique was used to separate the magnetic elastic cross section. Most magnetic disturbance appears on next-nearest-neighbour manganese atoms to the Zn impurity and is greater than would be expected from Lovesey and Marshall's model of very dilute alloys (1966). The range of the disturbance increases at higher temperatures. (16 refs.)

67894 Magnetic structure and magnetic properties of non-stoichiometric $Fe_{1-x}O$. M.Akimitsu, T.Mizoguchi (Dept. of Phys., Gakushuin Univ., Tokyo, Japan), S.Kimura.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.497-505 (1983).
The magnetic structure of non-stoichiometric $Fe_{1-x}O$ was investigated by neutron scattering measurements on a quenched single crystal of $Fe_{0.91}O$ below the Neel temperature. In each defect cluster, there exist ferromagnetic moments and they are arranged antiferromagnetically with a periodicity of twice that of the atomic superstructure. The relation between the defect structure and the magnetic properties for a wide range of compositions was discussed. (14 refs.)

67895 Isomorphic MeX_2O_4 compounds: anisotropic thermal expansion and magnetic order in $MnSb_2O_4$. J.R.Gavarri, G.Calvarin, B.Chardon (Lab. de Chimie-Phys. du Solide, Univ. Paris XIII, Chatenay-Malabry, France).
J. Solid State Chem. (USA), vol.47, no.2, p.132-42 (April 1983). In French.
Using X-ray diffraction data, the anisotropic thermal expansion coefficients α_a and α_c of two isomorphic compounds $MnSb_2O_4$ and $NiSb_2O_4$ are linked to the anisotropic elastic constants of these tetragonal structures and compared to the $ZnSb_2O_4$, $SnPb_2O_4$ thermal expansion coefficients. The anomalous thermal expansion observed for $MnSb_2O_4$ in the 6-115K range (maximum of α_c at 70K) is related to the ordering of Mn^{2+} ion magnetic moments. Using neutron diffraction, two kinds of antiferromagnetic order are observed for $MnSb_2O_4$ and $NiSb_2O_4$. At 6K the value of the resultant moment is approximately 1.8 μ_B for $NiSb_2O_4$ and 3.8 μ_B for $MnSb_2O_4$. A critical temperature of $T_c=115K$ is proposed for $MnSb_2O_4$ based on the use of X-ray diffraction data alone. (18 refs.)

67896 Surface-induced ordered magnetism in Mo and W and surface magnetic structures. Y.Teraoka (Dept. of Phys., Univ. of Osaka Prefecture, Sakai, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.19-21 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The possibility of the appearance of a surface-induced ordered magnetism on surfaces of Mo and W is discussed by use of the tight-binding model within the Hartree-Fock approximation and a surface magnetic structure with the lowest energy is discussed. (7 refs.)

67897 Short range antiferromagnetic ordering in fluoride glasses '$PbMnFeF_7$' and 'Pb_2MnFeF_9'. A.Le Bail, C.Jacoboni, R.De Pape (Lab. des Fluorures et Oxyfluorures Ioniques, Univ. du Maine, Le Mans, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.677-80 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Neutron diffraction and EXAFS experiments have been made on fluoride glasses '$PbMnFeF_7$' and 'Pb_2MnFeF_9' to provide informations about the magnetic short range order of pairs M-M ($M=Mn^{2+}$, Fe^{3+}) and the local environment of Mn^{2+} and Fe^{3+}. The magnetic correlation function shows in both glasses prevailing strong antiferromagnetic first neighbour interaction at 3.6 Å and two ferromagnetic interactions at 5.4 and 6.7 Å. EXAFS results confirm the expected sixfold coordination of Mn^{2+} and Fe^{3+}. The structure of these glasses is described in terms of randomly linked corner shared MF_6 octahedra chains with Pb^{2+} in interstitial sites. (13 refs.)

(for critical point effects, see 75.40)

75.30C Saturation moments and magnetic susceptibility

67898 Quasi-ferromagnetism in antiferromagnetic $GdVO_4$. K.Gaur, A.K.Tripathi, H.B.Lal (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.161-2 (April 1983).
The authors report the magnetic susceptibility and magnetisation behaviour of $GdVO_4$ above room temperature. Its behaviour is found to be like a typical ferromagnetic material in the range 300 to 900K and is unique. An hypothesis is proposed to explain this behaviour. (7 refs.)

67899 Magnetic susceptibility of $La_{1-x}Nd_xTlO_3$ system ($0.0\leq x\leq 1.0$) [and synthesis and X-ray characterisation]. B.N.Tiwari, P.N.Ojha (Dept. of Chem., Univ. of Gorakhpur, Gorakhpur, India).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.163-5 (April 1983).
$La_{1-x}Nd_xTlO_3$ ($x=0.2$, 0.5, 0.8 and 1.0) phases were synthesized by solid state reactions at elevated temperature and characterized by powder X-ray diffraction patterns. Magnetic susceptibility measurements of these phases in the temperature range 300 to 800K have been made and the results are reported. (9 refs.)

67900 Low-temperature magnetism of some alkali metal uranates(V) and alkaline earth neptunates(IV). Examples for ferrimagnetism in mixed actinide oxides. E.Konig, C.Rudowicz, V.P.Desai (Inst. fur Phys. und Theoretische Chem., Univ. Erlangen-Nurnberg, Erlangen, Germany), B.Kanellakopulos.
J. Chem. Phys. (USA), vol.78, no.9, p.5764-71 (1 May 1983).
The conventional molecular field (MF) approach is extended to apply to ferrimagnetically coupled f electron systems. The observed curvature of the inverse molar magnetic susceptibility $1/\chi_m$ as a function of temperature is attributed to the sizable effect of the TIP contribution. It is demonstrated that the magnetic behavior of $LiUO_3$, $NaUO_3$, KUO_3, Li_3UO_4, $BaNpO_3$, and $SrNpO_3$ is consistent with that of a two-sublattice ferrimagnet. The calculated $1/\chi_m$ data depend on the Curie constants C_A, C_B, the TIP contributions τ_A, τ_B, and the intrasublattice MF constants α, β. Excellent numerical fits of the experimental magnetic data are obtained above the transition temperature T_c, whereas below T_c the intersublattice MF constant γ has to be increased slightly. Due to the number of parameters involved (C_A, C_B, τ_A, τ_B, α, β), the emphasis is concentrated on the qualitative rather than the quantitative agreement with the applied model. (21 refs.)

67901 Magnetic susceptibility calculations from crystal field theory for high spin ferric complexes of tetragonal character. A.Labarta, X.Vinas, J.Tejada (Facultdad de Fisica, Univ. de Barcelona, Barcelona, Spain).
J. Chem. Phys. (USA), vol.78, no.9, p.5816-19 (1 May 1983).
An analytical expression for the magnetic susceptibility of ferric-high spin complexes with high tetragonal character has been obtained. The authors' analytical expression agrees closely with published data. (5 refs.)

67902 Magnetic properties of $Ni_{0.8}Cu_{0.2-x}Zn_x$ alloys. E.Burzo (Nat. Center of Phys., Bucharest, Rumania), I.Lupsa.
J. Phys. F (GB), vol.13, no.5, p.L89-93 (May 1983).
The authors report the results of magnetic measurements performed on $Ni_{0.8}Cu_{0.2-x}Zn_x$ alloys with $x\leq 20$ at.% Zn, in the temperature range 4.2-1100K and fields up to 50 kG. The saturation magnetisation as well as the Curie temperatures decrease linearly as functions of the valence electron concentration of the CuZn components of the alloys. In the paramagnetic range the susceptibility obeys a modified Curie-Weiss law $\chi=\chi_0+C(T-\theta)^{-1}$. Near the Curie points the low-field magnetisations and initial susceptibilities follow the asymptotic power laws: $M_x\propto t^{\beta}$ and $\chi\propto t^{-\gamma}$ with $\beta=0.35\pm 0.01$ and

γ=1.42+0.04. Finally, they analyse the magnetic behaviour of nickel in the alloys studied. (21 refs.)

67903 Crystal chemistry, magnetic, and electrical properties of hexagonal plutonium oxide chalcogenides: Pu_2O_2X, X=O, S, Se. J.M.Costantini, D.Damien, C.H.de Novion (DEN, Fontenay-aux-Roses, France), A.Blaise, A.Cousson, H.Abazli, M.Pages.
J. Solid State Chem. (USA), vol.47, no.2, p.210-18 (April 1983).
A study was made of the influence of the chalcogen X on the magnetic and electrical properties of Pu_2O_2X (X=O, S, Se) compounds and on bonding in these hexagonal compounds, isostructural with the corresponding rare-earth compounds. The comparison of the cell volumes of Nd_2O_2X and Pu_2O_2X compounds showed that the Pu^{3+} crystal radius decreased from β-Pu_2O_3 to Pu_2O_2Se as '5*f* delocalization' and 5*f*-*p* overlap increased. These plutonium compounds were all found to be antiferromagnetic. This was caused by superexchange coupling interactions via *p* orbitals of the oxygen and chalcogen ions. The Neel temperature increased from β-Pu_2O_3(26K) to Pu_2O_2S(28K) then to Pu_2O_2Se (34K) showing that 5*f*-*p* covalency was enhanced as the chalcogen electronegativity decreased and the *p* radial extent increased. The hexagonal β-Pu_2O_3 was found to be an insulator while both other compounds were semiconductors with gaps around 0.5 eV. These gaps were interpreted as the energy separation between the 6*d*-7*s* conduction band and the *np* band of the chalcogen X with some overlap of the occupied 5*f* states and the *np* band. A simple electron band scheme of these compounds is proposed on such assumptions. (25 refs.)

67904 Crystal chemistry, magnetic, and electrical properties of the tetragonal plutonium oxide telluride Pu_2O_2Te. J.M.Costantini, D.Damien, C.H.de Novion (CEN, Fontenay-aux-Roses, France), A.Blaise, A.Cousson, H.Abazli, M.Pages.
J. Solid State Chem. (USA), vol.47, no.2, p.219-24 (April 1983).
Describes the preparation and some physical properties of Pu_2O_2Te. Plutonium oxide telluride is isostructural with the corresponding rare-earth oxide tellurides which crystallize in the tetragonal system of La_2O_2Te-type. Magnetic susceptibility data from 4K to room temperature are reported together with resistivity measurements. Pu_2O_2Te is found to be an antiferromagnet below 56K and a semiconductor with an intrinsic energy gap of 0.65 eV. The magnetic behavior is interpreted in terms of superexchange coupling interactions via nonmetal *p* orbitals, i.e. in terms of 5*f*-*p* overlaps. This conclusion is supported by crystal chemistry considerations by comparison of the cell volumes of Pu_2O_2Te and Nd_2O_2Te. In Pu_2O_2Te, the Pu crystal radius is found to be much lower than that of Nd in Nd_2O_2Te, suggesting some 5*f* electron 'delocalization' leading to a crystal radius shrinkage. As for the hexagonal Pu_2O_2X compounds, with X=O, S, Se, the measured gap may be considered as the energy separation between the chalcogen *np* band and the 6*d*-7*s* conduction band, the occupied 5*f* states lying just below the *np* band with some 5*f*-*np* overlap. (16 refs.)

67905 Transient magnetic susceptibility of ferromagnetic semiconductors. S.S.Rozhkov, A.Yu.Semchuk (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1730-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3056-60 (Oct. 1982). [received: April 1983]
The transient behaviour of nonequilibrium electrons and magnons in ferromagnetic semiconductors is studied. The magnetic susceptibilities during the action of an electric field pulse and after its termination are evaluated. It is shown that the time dependence of the susceptibility is governed by the time dependence of the magnon temperature. (10 refs.)

67906 Magnetic properties of the $Rb_xCs_{1-x}Ni_xMn_{1-x}F_3$ system. F.S.Karapetyan, V.E.Adamyan, P.P.Syrnikov, G.D.Davtyan (Kh. Abovyan State Pedagogical Inst., Erevan, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1791-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3158-61 (Oct. 1982). [received: April 1983]
The authors study the magnetic properties of a series of solid solutions $Rb_xCs_{1-x}Ni_xMn_{1-x}F_3$, where x=0, 0.1, 0.2,..., 1.0. The different magnetic behavior of the isostructural crystals below the temperature of the transition to the ordered state is a good illustration of the rules of Goodenough (1969) and Kanamori (1959), which enable one to predict the magnetic behavior of a crystal in the ordered region on the basis of its structure and chemical composition. The magnetic susceptibility of finely pulverized samples has been studied by the Faraday method on a magnetic balance in the temperature range 4.2-700K and in fields from 3 to 13 kOe. By analyzing the experimental $1/\chi(T)$ curves, they have determined the values of the constants Θ_a, Θ, Θ_b, and C, and from these they calculated the molecular field constants α, β, and n and the exchange integrals I_{AA}, I_{BB}, and I_{AB} characterizing the intra- and intersublattice exchange interactions. (10 refs.)

67907 Existence of an intermediate state in $CuCl_2.2D_2O$ in the AC plane. A.V.Oleinik, P.I.Polyakov (Physicotech. Inst., Acad. of Sci, Donetsk, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1812-13 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3190-2 (Oct. 1982). [received: April 1983]
The results of experimental investigations of antiferromagnetic resonance (AFMR) in specimens of $CuCl_2.2H_2O$ and $CuCl_2.2D_2O$ show that reorientation of the magnetic moment of the lattice in the AC plane takes place through an intermediate state. (5 refs.)

75.30D Spin waves

(see also 76.50 Spin wave resonance)

67908 Spin-wave damping in ferromagnetic Heisenberg chains: $s={}^1/_2$ and 1. U.Glaus, S.W.Lovesey, E.Stoll (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
Phys. Rev. B (USA), vol.27, no.7, p.4369-74 (1 April 1983).
Numerical calculations of the transverse response function for short-length quantum-spin chains are used to study spin-wave damping at temperatures small compared with the Heisenberg exchange coupling. Results are presented for ferromagnetically coupled systems at several temperatures, for both spin ${}^1/_2$ and 1. At low temperatures, the numerical results are shown to be in good quantitative agreement with the predictions of nonlinear spin-wave theory. (13 refs.)

67909 On the spin wave spectrum in disordered ferromagnets. I.Ya.Korenblit, S.V.Maleyev, E.F.Shender (Leningrad Nuclear Phys. Inst., Gatchina, Leningrad, USSR).
Solid State Commun. (USA), vol.46, no.2, p.117-19 (April 1983).
The spin wave scattering on the low-energy localized magnetic excitations caused by spatial fluctuations of the exchange interaction energy is considered. These excitations resemble in many respects two-level systems in glasses, but their density of states may be much larger. The scattering results in the spin-wave damping, proportional at $\omega \gg T$ to their frequency. The correction to the stiffness coefficient at $T \gg \omega$ increases with the temperature as ln T. (10 refs.)

67910 Spin waves in Fe-Al-Si system. L.Dobrzynski, K.Blinowski, S.Bednarski (Inst. of Nuclear Res., Otwock-Swierk, Poland), H.Kepa, T.Giebultowicz, W.Minor.
Solid State Commun. (USA), vol.46, no.3, p.217-19 (April 1983).
Results of the neutron measurements of magnon dispersion relation in $Fe_{2.937}Al_{0.381}Si_{0.682}$ (Sendust) alloy are presented. The iron-iron interaction in the Fe-Al-Si system is considered and it is shown that the values of nearest-neighbour exchange integrals in the ordered alloys are linearly dependent on the interatomic distance, the rate of the decrease being about 40 meV/Å. This strongly supports a model of competing ferro- and antiferromagnetic interactions usually assumed for concentrated Fe-Al alloys exhibiting spin-glass behaviour. (20 refs.)

67911 Spin-wave excitations in antiferromagnets with an impurity exchange bond. G.N.Karadzhyan (Inst. of Phys. Res., Acad. of Sci., Ashtarak, Armenian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1567-9 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2767-72 (Sept. 1982). [received: April 1983]
A quasiclassical approximation is used to study spin-wave excitations above the Neel ground state in two-sublattice collinear antiferromagnets with an impurity exchange bond J' of an arbitrary sign. It is shown that only one impurity oscillation mode can exist irrespective of the lattice symmetry and it is described in terms of spin waves in an ideal antiferromagnet. Spin-wave exitations occur only for $J'/J>(J'/J)_{cr}$ ($J>0$ is the exchange integral for the crystal matrix). For a BCC lattice this critical parameter assumes the value $(J'/J)_{cr}=-3$. Local energy levels appear near the edges of the spin-wave band of an unperturbed crystal for $J'/J>1$ and their magnitude increases with increasing J'/J. The dynamics of spin deviations is investigated for atoms adjoining an impurity bond and for their nearest neighbors. (8 refs.)

67912 Local levels in the gap of the spin wave spectrum of a ferromagnet containing impurities. A.I.Lukanin, M.V.Medvedev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1745-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3085-9 (Oct. 1982). [received: April 1983]
Local levels which arise in a ferromagnet with an easy-axis single-ion anisotropy when one of the matrix atoms is replaced by an impurity with an easy-plane single-ion anisotropy are investigated. The effect of the lowest excited states in the gap of the spectrum of quasicontinuous spin excitations on the susceptibility and specific heat of the system is studied (several spin deviations at an impurity are considered). 75.30E Exchange and superexchange interactions

(see also 71.70 Level splitting and interactions)

67913 On the conditions for a unidirectional D vector in a Dzyaloshinsky-Moriya magnetic chain. C.E.Zaspel (Dept. of Phys. & Astron., Univ. of Southern Mississippi, Hattiesburg, MS, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5842-3 (1 May 1983).
A Dzyaloshinsky-Moriya exchange interaction with the form $H_{DM}=\Sigma_{ij} D_{ij}.S_i \times S_j$ has been shown to have two interesting effects on a ferromagnet: Melcher (1973) has shown that the spin wave dispersion relation will have a linear term and Liu (1973) in a study of the critical properties of a magnet with antisymmetric exchange has shown that there is a region in the phase diagram corresponding to helical ordering. Both of these results assume that

the D vector is a constant throughout the crystal. The author looks at the D vector on an atomic scale and determines what physical systems will result in a constant D. (5 refs.)

67914 Virtual bound state model for the exchange interaction in semimagnetic semiconductors such as $Cd_{1-x}Mn_xTe$. A.K.Bhattacharjee (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), G.Fishman, B.Coqblin.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.449-51 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The difference in both sign (i.e. ferromagnetic interaction in the conduction band and antiferromagnetic one in the valence band) and magnitude of the exchange interaction constant in semiconductors such as CdMnTe is explained by a virtual bound state model involving the resonance of the Mn d-level in the valence band. (14 refs.)

67915 The magnitude of the rare earth-rare earth exchange interaction in iron garnets. R.Z.Levitin, V.V.Snegirev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1613-15 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2846-9 (Sept. 1982). [received: April 1983]
It has previously been concluded that in iron garnets the rare earth-rare earth exchange interaction is large and comparable in magnitude to the rare earth-ion exchange interaction. The authors have calculated the theoretical dependences of the susceptibilities of the iron garnets of terbium, dysprosium, holmium, and erbium. The values of the molecular field coefficient λ were found from the values of the molecular field at room temperature. In the calculations the authors used the total quantum number J of the free trivalent ion and the g-factor so as to obtain the best agreement with the experimental data. (9 refs.)

75.30G Anisotropy

67916 Ferromagnets with random anisotropy: longitudinal spin resonance and movable anisotropy. W.M.Saslow (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1320-3 (25 April 1983).
Random anisotropy in ferromagnets causes small reorientations of the spins, so that they are not precisely collinear. As a consequence, an anisotropy torque develops for rotations about any axis. This requires the introduction of both a new macroscopic spin variable (to represent the macroscopic orientation about the magnetization) and an anisotropy triad. The macroscopic dynamics, including the dissipative motion of the anisotropy triad, is obtained, and a number of applications are considered. Most striking is the prediction of a longitudinal spin resonance mode. (11 refs.)

75.30K Magnetic phase boundaries

(inc. magnetic transitions, metamagnetism, etc)

67918 Magnetic properties of the ordered VPt_3 alloy. II. Critical behaviour around the Curie point. R.Jesser, A.Bieber, R.Kuentzler (Lab. de Magnetisme et de Structure Electronique des Solides, Inst. de Phys., Strasbourg, France).
J. Phys. (France), vol.44, no.5, p.631-46 (May 1983).
For pt.I see ibid., vol.42, p.1157 (1981). The ferromagnetic properties of the ordered VPt_3 alloy have been systematically investigated in a previous paper (Paper I). These investigations were carried out on bulk VPt_3 samples, one ordered in the Cu_3Au structure (the $VPt_3(1)$ sample) and the other ordered in the $TiAl_3$ structure (the $VPt_3(2)$ sample); disordered (Cu like) VPt_3 is only paramagnetic. In the present paper, the authors report a detailed investigation on the critical properties of $VPt_3(1)$ and (2) around their respective Curie points (240K and 210K). The corresponding magnetization measurements were performed in the moderate field range 0.5 $kOe \leq H \leq 20$ kOe, at several temperatures ranging from 195K to 271K for $VPt_3(1)$ and from 188K to 235K for $VPt_3(2)$. The iterative method used for the determination of T_c, β, γ and δ is described in detail. They found T_c=240.0K, β=0.50, γ=1.19 and δ=3.38 for $VPt_3(1)$, against T_c=210.3K, β=0.51, γ=1.21 and δ=3.38 for $VPt_3(2)$. The critical properties of both VPt_3 samples are well described in the frame of the static scaling theory: Widom's scaling law $\gamma=\beta(\delta-1)$ is well satisfied and the critical DHW (Domb, Hunter, Widom) equation of state holds for $VPt_3(1)$ and (2). (43 refs.)

67919 Cascade first-order phase transitions in quasi-one-dimensional antiferromagnets. Low-temperature analysis. G.V.Uimin (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.36, no.6, p.250-3 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.201-4 (20 Sept. 1982). [received: April 1983]
It is shown that a cascade of magnetic phase transitions from the antiferromagnetic phase to a phase with magnetization corresponding to one-third the saturation magnetization should exist in some quasi-one-dimensional antiferromagnets. (6 refs.)

67920 Volume dependence of the Curie temperature and localised moment in dilute PdFe, PdCo and PdNi alloys. J.Inoue, M.Shimizu (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. F (GB), vol.13, no.5, p.1081-90 (May 1983).
The volume dependence of the Curie temperature d ln T_c/d ln V at low T_c for dilute PdFe, PdCo and PdNi alloys is studied by taking into account the volume dependence of the localised moment on the impurity in the itinerant electron model. A model of the local spin fluctuation for the impurity moment is used to reduce the Curie temperature. The result for the condition to determine T_C is found to be similar to that obtained in the s-d model. By making use of the Lang-Ehrenreich model, it is shown that there are two contributions to d ln T_c/d ln V in the limit of $T_C \rightarrow 0$. One is the term obtained in the s-d model and the other comes from the volume dependence of the localised moment on the impurity. The localised moments on Fe and Co atoms are stable and have a very small effect on d ln T_C/d ln V. The localised moment on the Ni atom, however, is small and gives a large contribution to d ln T_C/d ln V. It is concluded that the finite value of d ln T_C/d ln V in the limit of $T_C \rightarrow 0$ results from the existence of the localised moments at $T \geq T_C$ and that the large exerimental values of d ln T_C/d ln V in dilute PdNi alloys can be explained in terms of the large volume dependence of the localised moment on Ni atoms. (32 refs.)

67921 Effects of random fields on the phase diagram of $Mn_{0.875}Zn_{0.125}F_2$. Y.Shapira (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA), N.F.Oliveira,Jr..
Phys. Rev. B (USA), vol.27, no.7, p.4336-50 (1 April 1983).
Phase transitions in $Mn_{1-x}Zn_xF_2$ x=0.125, were investigated using thermal-expansion, magnetostriction, and ultrasonic-attenuation measurements. The phase diagram was determined for $4.2K \leq T \leq T_N$ and $0 \leq H \leq 140$ kOe, where T_N=58.4K is the Neel temperature. The magnetic field H was parallel to [001]. The random field H_R induced by H influences the shape of the λ anomaly at the paramagnetic-antiferromagnetic transition, and depresses the transition temperature $T_c^{\parallel}$. Some evidence for an irreversible behaviour near $T_c^{\parallel}$ is found for $H \neq 0$. The paramagnetic—spin-flop boundary $T_c^{\perp}(H)$ exhibits a large 'bulge' towards high T. At 4.2K, the spin-flop field H_{sf} is 78 kOe, which is lower than that predicted by mean-field theory. The discrepancy is explained by considering the effect of the random fields. As T increases from 4.2K, H_{sf} first increases but then decreases as T approaches the bicritical temperature T_b=55K. It is possible that the latter portion of the spin-flop line is actually one of two second-order lines which surround an intermediate phase. The Neel temperature is in reasonable agreement with mean-field theory. (40 refs.)

67922 Magnetic and quadrupolar phase transitions in cubic rare-earth intermetallic compounds. P.Morin, D.Schmitt (Lab. Louis Neel, CNRS, Grenoble, France).
Phys. Rev. B (USA), vol.27, no.7, p.4412-20 (1 April 1983).
A new analytical approach of the problem of magnetic and quadrupolar phase transitions in rare-earth intermetallic compounds is presented, in terms of single-ion susceptibilities and within the Landau theory. The coefficients of the free-energy expansion are simply related to several magnetic, strain, and quadrupolar crystal-field susceptibilities, the expression of which is given for any multilevel system. The analysis of sign and relative magnitude of these susceptibilities leads to the different possible phase diagrams. Several examples are taken among the cubic rare-earth intermetallic compounds. (28 refs.)

67923 Phase diagram of the antiferromagnet $CsMnCl_3.2H_2O$ near the bicritical point. Effect of impurities. E.Velu, R.Megy, J.Seiden (Inst. d'Electronique Fondamentale, Univ. Paris XI, Orsay, France).
Phys. Rev. B (USA), vol.27, no.7, p.4429-44 (1 April 1983).
The phase diagram of the quasi-one-dimensional antiferromagnet $CsMnCl_3.2H_2O$ (CMC) was determined with great accuracy near the bicritical point T_b=4.3541K, H_b=2.0144 T, and near the Neel point T_N=4.880K. The experimental procedure included susceptibility measurements and ^{35}Cl and ^{133}Cs nuclear magnetic resonance. In the neighbourhood of the bicritical point, the two second-order transitions are described by the theoretical laws provided by the extended scaling theory. The anisotropic crossover exponent $\phi=1.225 \pm 0.005$ is intermediate between the theoretical values for the uniaxial symmetry (n=3) and for the orthorhombic symmetry (n=2). The ratio of

the bicritical amplitudes $\omega_\perp/\omega_\parallel$ is 1, in accordance with a theoretical calculation of the crossover temperature to the orthorhombic behaviour in a quasi-one-dimensional system. The authors have done similar measurements in CMC doped with Co (4 at.%) and Cu (0.4, 0.7, and 2.6 at.%) impurities. The experimental reduction of the bicritical field in CMC:Cu agrees with a theoretical calculation for a quasi-one-dimensional system with diamagnetic impurities. They have determined the phase diagram of CMC:0.7 at.% Cu near the bicritical point. A theoretical calculation shows that the random-field behaviour must be observable. In the neighbourhood of the bicritical point, the two second-order transition lines are described each by a different shift exponent. The upper shift exponent is $1.7<\phi_\perp<3.7$ qualitatively in accordance with the theoretical random-field value obtained by 6-d expansions but the lower shift exponent $1.2<\phi_\parallel<1.5$ does not agree with the expected value close to 1. An explanation can be the destruction of the genuine antiferromagnetic-paramagnetic transition in the presence of random fields at the lower critical dimensionality $d=3$. (43 refs.)

67924 Induced ferromagnetism in $ErRh_4B_4$. L.N.Bulaevskii, A.I.Buzdin, D.I.Khomskii, S.V.Panjukov (Phys. P.N. Lebedev Inst., Moscow, USSR).
Solid State Commun. (USA), vol.46, no.2, p.133-7 (April 1983).
To explain the experimental data on the coexistence of superconductivity and magnetic ordering in $ErRh_4B_4$ the authors suppose that the temperature of the transition to the ferromagnetic state in the absence of superconductivity varies over the samples due to the stresses and this transition is 1st order one or very close to it. They explain the origin of ferromagnetic peaks (F), satellites peaks and broad lines near F-peaks in the framework of the theory, which predicts the domain-like magnetic structure in the coexistence state. The higher satellites peaks intensities in scans are calculated assuming the irregularity of domain structures. (16 refs.)

67925 The influence of strong electromagnetic field on Curie temperature of ferromagnetics. G.M.Genkin, V.V.Zil'berberg (Inst. of Appl. Phys., Acad. of Sci., Gorky, USSR).
Solid State Commun. (USA), vol.46, no.5, p.427-8 (May 1983).
The influence of strong electromagnetic wave on the indirect exchange in rare-earth metals is considered theoretically. The effect of this influence on the Curie temperature is discussed. (3 refs.)

67926 Neutron-diffraction study of the structural and magnetic phase transitions in manganese selenide. G.I.Makovetskii, A.I.Galyas (Inst. of Solid-State & Semiconductor Phys., Acad. of Sci., Minsk, Belorussian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1558-60 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR),* vol.24, no.9, p.2753-6 (Sept. 1982). [received: April 1983]
The results of a neutron-diffraction study of MnSe are reported for the temperature range 77-340K. The Neel temperature determined from the temperature dependence of the intensity of the magnetic reflections of the cubic modification (NaCl structure) comes out to be 135±3K. It is shown that at low temperatures there is an incomplete transition from the cubic modification to a hexagonal one (NiAs structure) The temperature of the inverse transition during heating lies in the range 240-275K. The magnetic ordering in the hexagonal modification persists all the way up to the transition temperature. (11 refs.)

67927 New magnetic state in the compound Fe_2P. E.A.Zavadskii, L.I.Medvedeva, V.I.Val'kov (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1625-6 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR),* vol.24, no.9, p.2864-6 (Sept. 1982). [received: April 1983]
The authors consider the new magnetic state observed in Fe_2P at the first order ferromagnetic-paramagnetic transition. They construct the pressure-temperature phase diagram with the use of an induction method. (3 refs.)

75.40 CRITICAL-POINT EFFECTS, SPECIFIC HEATS, SHORT-RANGE ORDER

(inc. spin glasses)

67928 On a classical spin glass model. J.L.van Hemmen, A.C.D.van Enter, J.Canisius (Univ. Heidelberg, Heidelberg, Germany).
Z. Phys. B (Germany), vol.50, no.4, p.311-36 (1983).
A simple, exactly soluble, model of a spin-glass with weakly correlated disorder is presented. It includes both randomness and frustration, but its solution can be obtained without replicas. As the temperature T is lowered, the spin-glass phase is reached via an equilibrium phase transition at $T=T_f$. The spin-glass magnetization exhibits a distinct S-shape character, which is indicative of a field-induced transition to a state of higher magnetization above a certain threshold field. For suitable probability distributions of the exchange interactions: (a) A mixed phase is found where spin-glass and ferromagnetism coexist. (b) The zero-field susceptibility has a flat plateau for $0\leq T\leq T_f$ and a Curie-Weiss behaviour for $T>T_f$. (c) At low temperatures the magnetic specific heat is linearly dependent on the temperature. The physical origin of the dependence upon the probability distributions is explained, and a careful analysis of the ground state structure is given. (59 refs.)

67929 Ginzburg-Landau expansion for copper pairs with nonzero angular momentum and analogy between spin glasses and Cooper pair system. A.S.Sigov, V.R.Chechetkin.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.433-6 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
It is shown that the parts of the Ginzburg-Landau expansion corresponding to space-dependent angular and phase transformations have the same structure for all isotropic states with the total angular momentum $J=0$, 1, 2. The analogy between a system of Cooper pairs with nonzero angular momentum and the Sherrington-Kirkpatrick model of a spin glass is discussed. (11 refs.)

67930 Tricritical behaviour in a bond-dilute spin model. H.Dickinson, J.Yeomans (Dept. of Phys., Univ. of Southampton, Southampton, England).
J. Phys. C (GB), vol.16, no.12, p.L345-51 (30 April 1983).
The authors use a Migdal-Kadanoff renormalisation group to study the behaviour of the Blume-Emery-Griffiths model when quenched, random-bond dilution is introduced. Phase diagrams are calculated for varying dilution. The behaviour of the multicritical points of the pure system as dilution is introduced is of particular interest. They find that the tricritical temperature tends to zero as the percolation threshold is approached but that the tricritical field remains finite in agreement with experimental results on the dilute metamagnet $Fe_pMg_{(1-p)}Cl_2$. (16 refs.)

67931 Role of initial conditions in spin glass dynamics and significance of Parisi's $q(x)$. A.Houghton, S.Jain, A.P.Young (Dept. of Math., Imperial Coll., London, England).
J. Phys. C (GB), vol.16, no.12, p.L375-81 (30 April 1983).
The authors argue that standard treatments of dynamics are incorrect for non-ergodic systems such as the Sherrington-Kirkpatrick model of a spin glass. Since the system never loses the memory of its initial state it is necessary to average over initial states with a Boltzmann weight to obtain time-dependent correlation functions as conventionally defined. It is now necessary to introduce replicas. The 'dynamical' order parameter, q_{EA}, is equal to $q(x=1)$ in Parisi's scheme whereas the statistical mechanics order parameter, q, is given by $\int_0^1 q(x)\,dx$. They also propose an interpretation of the function $q(x)$. (18 refs.)

67932 Critical exponents of a system with isotropic multicomponent order parameter. L.M.Khriplovich (Inst. of Inorganic Chem., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.271-3 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR),* vol.36, no.6, p.219-21 (20 Sept. 1982). [received: April 1983]
The critical exponents of the specific heat near the Neel point T_N are determined experimentally for a system with an isotropic four-component order parameter (CO_3O_4). It is shown that the experimental value of α agrees with the value obtained with the renormalization-group method using the ϵ expansion only for $R>T_N$. (5 refs.)

67933 Magnetic satellites in mictomagnetic CuMn. T.M.Harders (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia), P.Wells.
J. Phys. F (GB), vol.13, no.5, p.1017-25 (May 1983).
The neutron scattering intensities about the $1^1/_2 0$ diffuse peak, in 15 and 40 at.% CuMn single crystals have been investigated. It is suggested that the maxima in the diffuse magnetic scattering intensity, which occurs at 1, $1\pm\delta'$, 0 type positions, is caused by an interaction with the conduction electrons. The wavevector of this modulation, indicating a tendency towards spiral magnetic order, is comparable to the Fermi surface diameter. (21 refs.)

67934 How to change or remove the anisotropy of spin glasses, with some other reflections on the anisotropy problem. A.Fert, S.Senoussi, D.Arvanitis (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
J. Phys. Lett. (France), vol.44, no.9, p.L345-50 (1 May 1983).
The authors develop some ideas on the freezing of the macroscopic anisotropy energy of spin glasses and introduce the concepts of thermo-remanent anisotropy (TRA) and isothermal remanent anisotropy (IRA). They present results of hysteresis cycle experiments on CuMn alloys which confirm these ideas. In particular they describe a method which allows the authors to reduce the anisotropy at will and even to remove it. (19 refs.)

67935 Frequency and field dependence of the magnetic susceptibility of an insulating spin glass. P.Beauvillain, C.Dupas, J.P.Renard, P.Veillet (Inst. d'Electronique Fondamentale, Univ. Paris Sud, Orsay, France).
J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1377-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
The authors have studied the susceptibility of amorphous manganese aluminosilicate for frequencies from 0 to 25 MHz and in DC magnetic fields up to 1000 Oe. The critical behavior of the nonlinear part of the static susceptibility is in qualitative agreement with the mean field theory of the spin-glass transition. (6 refs.)

67936 Evidence for scattering of phonons from magnetic excitations in amorphous spin glasses. D.M.Herlach, E.F.Wassermann, R.Willnecker (Tieftemperaturphys., Univ. Duisburg, Duisburg, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1404-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
The heat conductivity of amorphous $(Pd_{77.5-x}Cu_6Si_{16.5})Co_x$ spin glass alloys containing $x=0$-15 at.% Co is measured with high accuracy ($\lesssim\pm0.3\%$) in the temperature range $0.3\leq T\leq 25K$ and in magnetic fields $0\leq B\leq 5$ T. For the higher concentrated alloys ('cluster glass' region) the results clearly show the existence of a magnetic contribution in the thermal resistance of phonons. (14 refs.)

67937 Fluctuations in short-range spin-glasses. H.Sompolinsky (Dept. of Phys., Harvard Univ., Cambridge, MA, USA), A.Zippelius.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1297-300 (25 April 1983).
Spatial fluctuations in spin-glasses are studied by an expansion to quadratic order around the dynamic mean-field theory. Below T_c, a spatial decay of the 'spin-glass susceptibility' $[\chi^2(\vec{R},\omega)]_{av}$ is characterized at infinitesimal frequencies by a correlation length $\xi(\omega)$ which diverges as the inverse of the time-dependent Edwards-Anderson order parameter $q(1/\omega)$ in the limit $\omega\rightarrow 0$. The Fourier transform of equal-time correlations $[\langle S(0)S(\vec{R})\rangle]_{av}$ diverges as k^{-4}, signaling a breakdown of mean-field theory at low T below $d=4$. (14 refs.)

67938 **Spin dependent effects in semimagnetic semiconductors.** M.Grynberg (Inst. of Experimental Phys., Univ. of Warsaw, Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.461-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The spin dependent phenomena in semimagnetic semiconductor II-VI compounds with variable concentration of Mn are reviewed. The following topics are emphasized: the exchange interaction between free carriers and magnetic ions, the bound magnetic polaron in CdMnTe and CdMnSe in external magnetic field, the magnetic properties of semimagnetic semiconductors in paramagnetic, 'spin-glass' and antiferromagnetic phase. (36 refs.)

67939 **Critical effects in ferromagnetic semiconductors.** I.Balberg, A.Maman (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel), M.Heritier.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.482-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Detailed measurements of the specific heat and the resistivity of $CdCr_2Se_4$ were taken in the vicinity of its critical temperature T_c=130K. The experimental results confirm the predictions for an energy-like critical behaviour of the electronic properties. The results show that the holes in this material are scattered weakly by the spin fluctuations while the electrons propagate in a strongly correlated narrow d-band. (20 refs.)

67940 **Dynamic theory of ferromagnetic-to-spin-glass transition.** M.A.Continentino (Inst. de Fisica, Univ. Federal Fluminense, Rio de Janeiro, Brazil).
Phys. Rev. B (USA), vol.27, no.7, p.4351-8 (1 April 1983).
Studies the interaction between spin waves and magnetic two-level systems (TLS) in a ferromagnet with frustration. The coupling between the magnons and the TLS is due to the modulation of the angle between spins, by the rearrangement of the spins directions when the system tunnels from one metastable state to another. The magnon-TLS interaction causes an instability of the ferromagnetic phase with decreasing temperature due to the appearance of a soft mode. This instability is associated with the disappearance of long-range ferromagnetic order observed in reentrant ferromagnets. (36 refs.)

75.40D Ising and other classical spin models

67941 **Classical field descriptions of one-dimensional systems.** C.Bourbonnais, L.G.Caron (Dept. de Phys., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.4, p.550-63 (April 1983).
The authors discuss the limitations of classical field treatments of one-dimensional systems in the static approximation. Two exactly solvable Hamiltonians, the ferromagnetic Ising model, and its extension to a zero-width half-filled band, are studied after their transformation to a classical field form via the Hubbard-Stratonovich identity. The more usual two-field transformation consists of using one field to describe the divergent order parameter and another to represent the nondivergent modes. The fluctuations in this latter one are usually neglected and this is shown to lead to incorrect thermodynamic behavior throughout the critical region, which is unusually large in one-dimensional systems, and even beyond to the high temperature limit. The findings are extrapolated to other known Hamiltonians: Hubbard, Peierls and spin-Peierls, and Bardeen-Cooper-Schrieffer (BCS) superconductivity. (34 refs.)

67942 **Spontaneous symmetry breaking in spin glasses.** A.P.Young, S.Jain (Dept. of Math., Imperial Coll., London, England).
J. Phys. A (GB), vol.16, no.6, p.L199-204 (21 April 1983).
The authors discuss the effect of a small uniform symmetry breaking field on the Sherrington-Kirkpatrick (1978) spin glass model. Both $q(h)=\langle\langle S_i\rangle_T{}^2\rangle_J$ and $q_{ij}(h)=N\langle\langle S_i\rangle_T\langle S_j\rangle_T-\langle S_iS_j\rangle_T\rangle_J$ are given by scaling functions, $f(h/h^*)$ and $g(h/h^*)$ respectively, where $h^*=T/N^{1/2}$. They show that $g(x)=xf'(x)$ so that in the symmetry broken situation ($h/h^*\rightarrow\infty$ but $h\ll 1$) one has $f(x)\rightarrow q$, the statistical mechanics order parameter, and $g(x)\rightarrow q_{ij}=0$. The latter is in contrast to the conclusions of Young and Kirkpatrick based on numerical evidence for small samples. They discuss the reasons for this discrepancy. (13 refs.)

67943 **Phase separations in Ising model with free boundary condition.** K.Kuroda (Dept. of Math., Keioi Univ., Tokyo, Japan).
J. Stat. Phys. (USA), vol.30, no.1, p.1-13 (Jan. 1983).
Considers the problem of phase separations in Ising model with free boundary condition. The author proves that a typical configuration has just one open contour λ which separates V into two parts which are occupied by the opposite phases. λ is the shortest possible contour compatible with the condition that V is divided by λ into two regions of area $\rho|V|$ and $(1-\rho)|V|$. (8 refs.)

67944 **Comparison of different boundary conditions for Monte Carlo simulations of Ising models.** N.Jan (Center for Polymer Studies, Boston Univ., Boston, MA, USA), M.O.Steinitz.
J. Stat. Phys. (USA), vol.30, no.1, p.37-44 (Jan. 1983).
The effects of various boundary conditions on the Monte Carlo method have been studied through an analysis of the two-dimensional Ising model using a 30×30 system. The following boundary conditions were used: mean field, free edges, periodic, and correlated. The results confirm the reliability of periodic boundary conditions but the correlated boundary conditions are comparable and in some instances yield results (the critical temperature for example) that are in better agreement with the exact values. (7 refs.)

67945 **Residual entropy of the one-dimensional Ising antiferromagnet with general spin.** D.Hajdukovic, S.Milosevic (Dept. of Phys. & Meteorology, Faculty of Natural & Math. Sci., Belgrade, Yugoslavia).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.57-8 (11 April 1983).
The authors have calculated the ground-state degeneracy and the concomitant residual entropy of the one-dimensional Ising antiferromagnet in a critical magnetic field. They demonstrate that the results obtained can be related to the ground-state properties of the *q*-state Potts antiferromagnet in the corresponding external field. (8 refs.)

75.40F Heisenberg and other quantized spin models

67946 **Linked cluster expansion for quantum spins.** K.J.Niskanen (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland), J.Kurkijarvi.
J. Phys. A (GB), vol.16, no.7, p.1491-504 (11 May 1983).
A vertex renormalised selfconsistent graph model for a quantum spin system is presented with the ordering transition temperature appreciably lowered from the classical value for a small spin quantum number *I*. The model applies for example to the dipole-dipole interaction in addition to the exchange interactions. The derivation is restricted to zero external field. (20 refs.)

67947 **Monte Carlo study of a Heisenberg antiferromagnet on an FCC lattice with and without dilution.** J.F.Fernandez (Inst. Venezolano de Investigaciones Cientificas, Caracas, Venezuela), H.A.Farach, C.P.Poole,Jr., M.Puma.
Phys. Rev. B (USA), vol.27, no.7, p.4274-80 (1 April 1983).
A Monte Carlo simulation is performed of a Heisenberg model with nearest-neighbour antiferromagnetic interaction. It is carried out on a FCC lattice of size $n\times n\times n$ unit cells, where n=4, 6, and 8 ($4n^3$ spins), with a fraction (x) of the sites occupied by N spins. This model, which is random for $x<1$, on a frustrated lattice, is related to nonconducting spin-glasses, such as $Cd_{1-x}Mn_xTe$. For x=0.5 and 1, the authors calculated the following quantities: (i) the specific heat C; (ii) $q(t)=N^{-1}\Sigma_i\langle\mathbf{S}_i(0).\mathbf{S}_i(t)\rangle$; and (iii) the relaxation time (τ) associated with $q(t)$. For x=1, a singularity in C versus the temperature seems to develop at $T\simeq 0.4J/k_B$, which becomes sharper as N becomes larger, and τ seems to diverge as $T\rightarrow 0.4J/k_B$ also. Furthermore, additional results for systems of $8\times 8\times n$ cells (256n spins) for n=2, 4, and 8, show that the peak in C becomes rounded as n decreases. For x=0.5, C seems to be smooth in T and independent of N, and $\tau\sim T^{-3}$ which indicates that there is no transition for $T\neq 0$. Thus this model seems to lack some essential ingredient to describe the paramagnetic to spin-glass transition seen experimentally in systems such as $Cd_{1-x}Mn_xTe$. (20 refs.)

67948 **Effects of biquadratic exchange interaction on dynamic susceptibility in Heisenberg ferromagnet.** R.N.Shrivastava, M.Tiwari (Inst. of Technol., Banaras Hindu Univ., Varanasi, India).
Solid State Commun. (USA), vol.46, no.2, p.189-92 (April 1983).
The Green function technique has been employed to study the dynamic susceptibility of a spin-1 system above the Curie temperature. Bilinear and biquadratic terms have been added in writing the Hamiltonian of the system. Higher order Green functions have been decoupled by RPA and Callen type decouplings. The dependence of spin wave energy, intensity and susceptibility on wavevector and biquadratic parameter have been studied. (18 refs.)

67949 **Critical exponents for alternation in Heisenberg antiferromagnetic chains.** S.Ramasesha, Z.G.Soos (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).
Solid State Commun. (USA), vol.46, no.7, p.509-11 (May 1983).
The ground-state energy per site, $\lambda(\delta)$, and singlet-triplet gap, $\Delta E(\delta)$, of regular (δ=0) and alternating ($\delta\leq 0.01$) Heisenberg antiferromagnetic chains are obtained by extrapolating exact numerical solutions of even and odd rings and chains of $N\leq 20$ spins. The critical exponents of 1.72±0.02 for $\lambda(\delta)$ and 0.9±0.1 for $\Delta E(\delta)$ are compared with recent theoretical results for spin-Peierls transitions. Interactions among spinless fermions alter the instability to alternation. (18 refs.)

75.60 DOMAIN EFFECTS, MAGNETIZATION CURVES, AND HYSTERESIS

67950 Basic properties of grain-oriented electro-technical steels. Vol. II: Flux distribution and waveforms.
Report EUR 6647/II EN, Comm. European Communities, Luxembourg (1982), xlvii+153 pp. Contract 6210.KL/8/801.
A study was made of 3.25% grain oriented electrotechnical steel (electrical steel) produced in accordance with ARMCO teachings. The factors affecting the efficiency of the magnetic mechanisms within the material were revealed and the criteria necessary to be fulfilled to maximise the magnetic properties were specified. The nature of flux distributions and the character of circulating flux—particularly in the joints of magnetic circuits—in the transformer and rotating machine applications were revealed. Also a technique for recording waveforms in a full size transformer core was developed to a practical level with a view to using these recordings to drive laboratory test apparatus with these 'real' waveforms. New information on magnetostriction behaviour under the combined effects of stress with temperature was provided as a basis for further work and to assist designers of machines which run at temperatures above ambient. Additional work has defined the nature of the change in magnetic properties with temperature and with two-dimensional stress. (23 refs.)

67951 Muonic method of investigating the magnetic properties of electrical-engineering steels. S.G.Barsov, A.L.Getalov, V.A.Gordeev, V.N.Goralkin, P.L.Gruzin, S.P.Kruglov, L.A.Kuz'min, V.P.Mel'nichuk, S.M.Mikirtych'yants, V.Yu.Miloserdin, V.P.Smilga, G.V.Shcherbakov (Moscow Engng. Phys. Inst., Moscow, USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.18-20 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.643-5 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

It is shown that a muonic method not only allow the magnetic-texture parameters of nonmagnetized materials to be investigated, but also allows the magnetic properties of materials at different stages of production to be monitored. (1 ref.)

67952 Dynamic domain structure of (111) crystals of Fe-3.2% Si alloy. V.P.Makarov, B.V.Molotilov, V.P.Kuz'mishko, B.A.Kornienkov (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.21-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.646-51 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

The dynamic domain structure of (111) crystals of Fe-3.2% Si alloy with quasistatic and dynamic reversal is investigated by X-ray topographic and powder methods. The domain-structure topography in the volume and at the surface of the crystal is interpreted. (1 ref.)

67953 Influence of a coating on the domain structure of highly textured electrical-engineering steel. S.V.Zhakov, B.N.Filippov (Inst. of Metal Phys., Acad. of Sci., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.29-33 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.655-9 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

In the thin-plate approximation, the influence of the stress created by a coating on the domain size in single crystals with a surface plane of type (110) is calculated. It is shown the coating may decrease the domain size by a factor of 2.5-3. (8 refs.)

67954 Magnetically active coatings and the structure of a metal-ceramic composite.. V.P.Makarov, V.G.Matsuk, B.V.Molotilov.

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.660-5 gr 34-9 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

For the example of the alloy Fe-3.2% Si, the influence of magnetically active coatings on the domain structure and magnetic properties is considered. It is shown that the domain structure depends significantly on the kinetics of the process of coating formation. Possible methods of forming an optimal transition process of coating formation. Possible methods of forming an optimal transition layer are considered. The influence of the initial sample texture on the magnetic properties of the composite is discussed. (5 refs.)

67955 Influence of additives in the composition of thermostable coatings of the structure and properties of the alloy Fe-3% Si. G.A.Brashevan, T.V.Zhitkova, A.K.Belyavskii, S.V.Fedorova (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.87-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.716-18 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

The influence of additives in the composition of thermostable coatings (TC) on the structure, the crystallographic and magnetic texture, and also the magnetic properties of anisotropic steel is investigated. It is shown that introducing additives of Ti, B compounds in the TC composition leads to change in grain structure and improvement in magnetic properties, and facilitates the formation of a high-quality coating. (7 refs.)

67956 Domain walls and the Holstein-Primakoff transformations. M.S.Swanson (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).

Phys. Rev. B (USA), vol.27, no.7, p.4421-8 (1 April 1983).

The problem of determining the interaction of spin waves in the presence of a domain wall is examined. The Hamiltonian for a ferromagnet with a uniaxial anisotropy is rewritten in terms of harmonic oscillators with the use of the Holstein-Primakoff transformations (1940). In the continuum limit a nonrelativistic scalar field theory is obtained. The equation of motion in three spatial dimensions admits domain-wall solutions. The Hamiltonian is expanded about the classical solution and the quadratic terms are used to generate the spin-wave spectrum. The results are shown to be consistent with other methods. The space of states and propagators are exhibited, and the extension to the higher-order terms governing spin-wave interactions is discussed. (16 refs.)

67957 Deformation-induced domains in antiferromagnets. V.V.Gann, A.I.Zhukov (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1584-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2799-802 (Sept. 1982). [received: April 1983]

The structure of the ground state of an antiferromagnet with an 'easy-plane' type magnetic anisotropy subjected to unidirectional strain in an external magnetic field is investigated. It is shown that in a definite strain interval, a nonuniform state consisting of two or more domains separated by domain walls is energetically favorable. A phase diagram of a two-phase system containing a magnetoelastic domain wall in a finite specimen is constructed. (3 refs.)

67958 Investigation of magnetic properties and Mossbauer spectra of $La_xBa_{(1-x)}Fe_{(12-x)}Zn_xO_{19}$ ferrites. Du You-We, Lu Huai-Xian, Zhang Yu-Chang, Hui Li-Ren, Wang Ting-Xiang (Dept. of Phys., Nanjing Univ., Nanjing, China).

Acta Phys. Sin. (China), vol.32, no.2, p.168-75 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*

The hexagonal ferrites $La_xBa_{(1-x)}Fe_{(12-x)}Zn_xO_{19}$ were prepared by oxalate coprecipitation method. The ferrites with magnetoplumbite structure were found to be formed for $x<0.8$, the specific magnetization σ increases with increasing x, but Curie temperature θ_f and the magnetic crystal anisotropy constant k decreases with increasing x. Mossbauer spectra have revealed that Zn^{2+} ion tends to occupy $4f_2$ site. (21 refs.)

67959 Electromagnetic losses of thin magnetically soft ferromagnets at prevailed magnetic-reversal frequencies. Yu.N.Dragoshanskii, A.P.Potapov, A.A.Glazer (Inst. of Metal Phys., Acad. of Sci., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.1-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.626-9 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

The change in electromagnetic losses associated with narrowing of a tape of the electrical-engineering alloy Fe-3% Si with a crystalline texture of type (110) [001] of different degrees of perfection is investigated, in the range of induction $B_m=0.8$-1.6 T and of magnetic-reversal frequency $f=400$-10000 Hz. A significant reduction in losses is shown with decrease in tape thickness from 300 to 30 μ; the rate of this reduction is higher in materials with more perfect texture. (7 refs.)

67960 Electromagnetic losses in nontextured electrical-engineering steels at high induction and frequency and the influence of domain-structure destabilization. N.V.Dmitrieva, I.E.Startseva, V.V.Shulika (Inst. of Metal Phys., Acad. of Sci., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.5-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.630-2 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

The role of various magnetization processes in the formation of electromagnetic losses of untextured electrical-engineering steel with 4 ct.% Si is investigated, and degree to which stabilization of the domain structure due to induced anisotropy affects the lossses is elucidated, for various frequencies (from 60 to 10000 Hz) and inductions (up to 1.5 T). (7 refs.)

67961 Energy losses during rotational magnetic reversal in electrical-engineering steel alloyed aluminum. G.S.Korzunin, L.A.Inisheva (Inst. of Metal Phys., Acad. of Sci., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.8-10 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.633-5 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

Results are given of measurements of the losses during rotational magnetic reversal of electrical-engineering steels with different chemical compositions and electrical resistivities at frequencies of 10-70 Hz. At 50 Hz, the losses during rotational magnetic reversal are compared with those during cyclic magnetic reversal. (5 refs.)

67962 Influence of cooling rate on the magnetic properties of untextured electrical-engineering steels. I.E.Startseva, V.V.Shulika, V.A.Lukshina.

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.11-13 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.636-8 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

It is shown that, by increasing the rate of cooling after heat treatment in the temperature range 400-800°C, the basis magnetic characteristics of untextured electrical-engineering steels with a small carbon content may be significantly improved. (4 refs.)

67963 New method of reducing the coercive force and electromagnetic losses in (110) [001] crystal of the alloy Fe-3.2% SI. V.P.Makarov, B.A.Kornienkov, B.V.Molotilov, V.P.Kuz'mishko (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.14-17 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.639-42 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

A new method is proposed for reducing the coercive force and electromagnetic losses in (110) [001] crystals of the alloy Fe-3.2% Si by forming a developed block structure in them. Possible mechanisms leading to reduction in H_c and the losses are proposed. (8 refs.)

67964 Magnetic properties of Fe-Si alloys at high frequencies. L.V.Mironov, Z.N.Bulycheva, B.B.Mints, L.K.Kurennykh, A.A.Petrovskii, V.A.Alekseev (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.26-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.652-4 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

The magnetic properties of Fe-Si alloys containing 3 and 4.5% Si are investigated in the frequency range 400-20000 Hz. Magnetization curves at 400, 1000, and 2000 Hz are given. The dependence of the total magnetic energy losses on the frequency of the magnetizing field and the amplitude of the magnetic induction is obtained. The influence of the sample structure is shown. (3 refs.)

67965 Investigating the regular behavior of the magnetic losses of cold-rolled isotropic electrical-engineering steel with the aim of creating standard samples. A.S.Veksler, N.N.Yagovkina (D.I. Mendeleev All Union Sci. Res. Inst. of Metrology, USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.40-2 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.666-8 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).

Dependence of the specific magnetic losses of samples of cold-rolled isotropic electrical-engineering steel on the amplitude of the magnetic induction, the degree of distortion of the induction flux, the magnitude of the magnetic flux outside the sample, and the temperature are obtained. (4 refs.)

67966 Enhancement of permeability in ferrite toroids subjected to rotating magnetic fields. G.Zini, F.Ronconi, F.Masoli, G.Buttino (Istituto di Fisica, Univ. of Ferrara, Ferrara, Italy).
J. Appl. Phys. (USA), vol.54, no.4, p.2121-2 (April 1983).
This paper reports the effects of test field parameters on the measurements of complex permeability in flat ferrite toroids, carried out by the AC bridge method during the rotation of a DC magnetic field, applied in the toroid plane. Under such conditions the permeability is generally higher than when measured with the DC field in a fixed direction and it can be controlled by proper choice of the test and rotating magnetic fields. The enhancement has been interpreted as due mostly to a direct influence of the test field upon the irreversible wall displacements produced by the rotating field. (5 refs.)

67967 Magnetization of Fe-Cr-Ti spinels. E.Schmidbauer (Inst. fur Allgemeine und Angewandte Geophys., Univ. Munchen, Munchen, Germany).
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.124-6 (1983).
Magnetic properties are reported for the spinel series $Fe_{2.4-t}Cr_{0.6}Ti_tO_4$, $O \leq t \leq 0.7$, with $t=0$, 0.2, 0.4, 0.6 and $Fe_{2.1-t}Cr_{0.9}Ti_tO_4$, $0 \leq t \leq 0.55$, with $t=0$, 0.2, 0.4, 0.45, 0.5. Magnetic moment data are compared with theoretical values derived from different ion distribution models. With increasing Ti concentration the compositions become hard magnetic spinels due to the increased number of Fe^{2+} ions on A- and B-sites of the spinel lattice. (11 refs.)

67968 Magnetic characteristics of La_5Ge_3, Ce_5Ge_3, Pr_5Ge_3. R.P.Krentsis, S.M.Barmin, A.A.Sevast'yanov, P.V.Gel'd (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1620-1 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2856-9 (Sept. 1982). [received: April 1983]
The authors have investigated the dependence on field and temperature of the magnetization (σ) of La_5Ge_3, Ce_5Ge_3 and Pr_5Ge_3 between 4.2 and 300K and also the temperature dependence of the magnetic susceptibility (χ) in the range from 80 to 600K. (7 refs.)

67969 Size effect of magnetic moment density of dispersed nickel. T.S.Cale, J.T.Richardson, J.Ginestra (Dept. of Chem. Engng, Univ. of Houston, Houston, TX, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.744-6 (15 April 1983).
An extension of superparamagnetic superposition analysis is used to show a crystallite size effect on the magnetic moment density of nickel dispersed on silica. A clear effect on room-temperature moment density is seen for samples with crystallites much less than 3 nm in radius. (9 refs.)

67970 Magnetic domain studies on single-domain particles of the low-temperature phase of MnBi by the colloid-SEM method. M.Munakata, K.Goto, T.Sakurai (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).
Philos. Mag. B (GB), vol.47, no.4, p.431-6 (April 1983).
Magnetic domains of isolated small particles of the low-temperature phase of MnBi in the ball-milled state after sintering have been studied by the colloid-SEM (scanning electron microscope) method, a modified Bitter method, with magnifications from 10000× to 45000×. By decreasing the particle size, domain patterns characteristic of the single-domain particles were found. Observations show that the critical size of the single-domain particle is greater than 1 μm which is larger than the theoretical value of about 0.5 μm. This difference is discussed. (28 refs.)

75.60L Magnetic aftereffects

67971 Investigation of magnetic after-effect in cobalt-doped thin garnet films. S.Uba, A.Maziewski (Warsaw Univ., Bialystok, Poland), J.Simsova.
J. Phys. C (GB), vol.16, no.12, p.L383-6 (30 April 1983).
Unexpectedly small velocities of demagnetisation processes have been observed in $Y_2Ca_1Fe_{39}Co_{0.1}Ge_1O_{12}$ films. These phenomena have been investigated in the experimental set-up based on the Faraday effect. The investigated after-effects have been numerically analysed in terms of continuous distribution of relaxation times τ. Strong dependences of τ on temperature and applied magnetic field have been found. The activation character of relaxation processes has been determined. (5 refs.)

75.70 MAGNETIC FILMS AND PLATES

67972 Electron spin polarized tunneling study of ferromagnetic thin films. R.Meservey, P.M.Tedrow, J.S.Moodera (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.1-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The development of spin-polarized electron tunneling is reviewed beginning with the spin properties of superconductors. Previous results on ferromagnetic films of the transition metals and the heavy rare earth metals are briefly summarized. Spin polarization results of the proximity effect in Ni and Fe films are given. Recent work on artificial tunnel barriers of amorphous Si and Al_2O_3 is described and high quality spin-polarized tunneling curves are presented for Ni using an artifiical Al_2O_3 barrier. Application of the technique to resolving the spin densities of states of superconductors is presented. Ferromagnetic-ferromagnetic tunneling is discussed. (40 refs.)

67973 Calculation of magnetic moment distributions in multilayered films. N.Hamada, K.Terakura (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), A.Yanase.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.7-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Self-consistent band-structure calculation is effective to study the magnetic moment disribution near the interface of a multilayered film. In an artificial crystal consisting of five Fe and three V atomic planes, the magnetic moment is disturbed strongly in the first atomic planes on the interface. (5 refs.)

67974 Spin polarization of Ni overlayers on an Al(100) substrate. N.Tateno, T.Kambara, K.I.Gondaira (Univ. of Electro-Communications, Tokyo, Japan), Y.Isshiki.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.9-10 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The spin-polarized electronic structures of the two 6-layer (100) slabs, Ni_1Al_5 and Ni_2Al_4 are determined by using the discrete-variational Xα method. The results show that the magnetic moment of the Ni layers in contact with Al is noticeably reduced but not completely suppressed. (10 refs.)

67975 Magnetism of Fe thin films in contact with Al(100) substrate. Y.Isshiki (Tokyo Metropolitan Industrial Tech. Inst., Tokyo, Japan), T.Kambara, K.I.Gondaira.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.11-13 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The spin-polarized electronic structures of the seven-layer (100) slab, Fe_2Al_5 is calculated by using the discrete variational Xα method. The magnetic moment of the interface Fe layer is enhanced but that of the surface Fe layer is hardly affected by the backing with Al. (11 refs.)

67976 Electron spin polarization (ESP) on surfaces and thin films of ferromagnetic metals. C.Rau, S.Eichner (Sektion Phys., Univ. of Munich, Munich, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.25-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The ESP at surfaces of oligatomic epitaxial Ni(100)-layers prepared on Cu(100) and NaCl(100) substrate crystals is determined by electron capture spectroscpy (ESC). No evidence is found for the existence of 'intrinsically magnetic dead layers' at Ni(100) surfaces. ECS measurements at surfaces of antiferromagnetic bulk Cr show that ferromagnetic order exists at 293K ($T_N=310K$) at the topmost atomic layer of the Cr(100)$c(2\times2)$ surface. (18 refs.)

67977 Magnetization of ultra-thin epitaxial Fe films. G.Bayreuther, G.Lugert (Inst. fur Angewandte Phys., Univ. Regensburg, Regensburg, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.50-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Ultra-thin ($2\ Å \leq t \leq 100\ Å$) epitaxial ^{57}Fe films were grown in UHV on epitaxial Ag films. Magnetization, $M(H,T)$ ($H \leq 50$ kG; $2K \leq T \leq 400K$) obtained with a SQUID magnetometer and conversion electron Mossbauer spectra are discussed as a function of film thickness. The magnetic shape anisotropy, the M_s-T relation and the room temperature Mossbauer spectra change drastically when the film becomes thinner than 2 atomic layers. (8 refs.)

67978 Antiferromagnetism of FCC iron films. R.Halbauer, U.Gonser (Angewandte Phys., Univ. des Saarlandes, Saarbrucken, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.55-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
In γ-Fe films of the three basic orientations (111), (110) and (100), prepared by epitaxial growth, antiferromagnetic ordering was established at low temperature. (8 refs.)

67979 Magnetic properties of Fe-Ni Invar alloy films. M.Konno (Dept. of Phys., Metropolitan Coll. of Technol., Tokyo, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.57-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
A detailed experimental study of the Invar alloy films show that the behaviour of γ-phase Fe-Ni films resembles that of Y-Fe-Ni amorphous film, that is, $\partial M_s/\partial T$ is constant. This phenomenon is discussed by the environmental effect of Fe-Fe pair interaction in the inhomogeneous state. (6 refs.)

67980 Amorphons in thin films. L.Wojtczak, T.Balcerzak (Dept. of Solid State Phys., Univ. of Lodz, Lodz, Poland), J.Mielnicki.
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.62-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
A description of amorphon properties is given by means of a modified treatment of magnons based on the approach used in the theory of disordered alloys. The present considerations include also the boundary conditions at the surfaces of thin films and allows the authors to discuss the properties of surface amorphons. The results show that the special nature of amorphons is due to differences in the density of states when compared with the case of a crystalline medium. The amorphons are of the type of elementary excitations appearing in inhomogeneous media and become magnons when the medium is translationally invariant. (8 refs.)

67981 Magnetic and magneto-optical properties of bismuth-substituted gadolinium iron garnet films. P.Hansen, K.Witter, W.Tolksdorf (Philips GmbH Forschungslab. Hamburg, Hamburg, Germany).
Phys. Rev. B (USA), vol.27, no.7, p.4375-83 (1 April 1983).
The saturation magnetisation M_s, the uniaxial anisotropy K_u, the optical absorption α, the Faraday rotation θ_F, and the Faraday ellipticity ψ_F of epitaxial garnet films of composition $Gd_{3-x}Bi_xFe_5O_{12}$ have been investigated for $x \leq 1.43$. The temperature dependence of M_s and θ_F have been measured in the range $4.2K \leq T \leq T_C$. The compensation temperature decreases and the Curie temperature increases linearly with the Bi content in accordance with data reported for bismuth-substituted yttrium iron garnets. The contribution of the bismuth to the rotation $\Delta\theta_F/x$ at $\lambda=633$ nm was found to be -23800 deg cm^{-1} and -20600 deg cm^{-1} at $T=4.2$ and 295K, respectively. θ_F has been described in terms of the sublattice magnetisations inferred from the fit of the molecular-field theory to the saturation magnetisation. The extracted magneto-optical coefficients exhibit a nonlinear variation with x for both octahedral and tetrahedral sites. The growth-induced anisotropy shows a linear dependence on x and reaches a value of 1.74×10^4 Jm^{-3} at $x=1.43$. The optical absorption was measured for wavelengths ranging between 500 and 800 nm. (34 refs.)

67982 Magnetic properties of Ni, Fe and Co thin films with sulfur impurities. N.Sulitanu (Facultatea de Fizica, Iasi, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.10, p.945-71 (1982). In Rumanian.
Discusses the preparation of thin films with sulfur impurities, measurement of some magnetic and structural characteristics, thermal treatments, the influence of thiourea on the evolution deposition process of ferromagnetic metals with sulfur impurities, magnetic properties of Ni thin films with sulfur impurities, magnetic properties of Fe thin films with sulfur impurities, and magnetic properties of Co thin films with sulfur impurities. 75.70K Domain structure (magnetic bubbles)

67983 Generation and annihilation of vertical Bloch lines in strip domain walls. Mao Ting-De, Li Jing-Yuan, Fan She-Yong, Liu Ying-Lie (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.176-81 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Magnetic domains in a magnetic bubble film have been observed in different bias fields after application of pulsed bias fields. The experimental results indicate that the formation of multifingered domains during the rapid expansion of bubbles is usually accompanied by the generation of a large amount of vertical Bloch lines (VBL). The sign of the VBL has a definite relation to the strength of the bias fields applied. On application of a series of bias pulses which are not very strong, the motion of strip domain heads leads to the generation of a large amount of VBL in the domain walls. The VBL will disappear when the pulsed bias fields are strong enough. (11 refs.)

67984 Magnetic domain structures in CoCr films studied by Lorentz microscopy. M.Ohkoshi, T.Kusuda (Dept. of Electronics, Faculty of Engng., Hiroshima Univ., Higashi-Hiroshima, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L130-2 (March 1983).
Magnetization distribution and behavior of magnetization in CoCr sputtered films of various thickness are studied by high-resolution Lorentz microscopy. The perpendicular component of magnetization increases with increasing film thickness, corresponding to the increase in the Q-value. The dominant mechanism of magnetization reversal changes from the domain wall displacement mode in the 200 Å thick film to the rotational mode in the 1000 Å thick film. In the 600 Å thick film, elongated domains with a kind of cross-tie walls are formed perpendicular to an AC demagnetizing field in the film plane.

67985 Strip domain structure of an open type. A.S.Zhukarev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1815-16 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3195-7 (Oct. 1982). [received: April 1983]
The authors study a stripe domain structure of an open type in a plane-parallel ferromagnetic or ferrimagnetic plate of thickness 2L assuming that the easy magnetization axis is normal to the plane of the plate (the z axis). Stripe domains whose magnetization is parallel or anti-parallel to the z axis are separated by Bloch domain walls, i.e. by walls in which the torsion is small and the rotation of the magnetization vector M is mainly in the plane of the wall (the YZ plane). The assumption about a small torsion angle is justified physically since the wall then carries a smaller 'charge' and has a lower energy. (4 refs.)

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

67986 Magnetoelastic properties of yttrium iron garnet doped with Tb^{3+} and Yb^{3+} ions. E.M.Smokotin, G.F.Gusyatskii, A.A.Vetrov, S.A.Volkov (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1589-92 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2809-13 (Sept. 1982). [received: April 1983]
The magnetoelastic properties of yttrium iron garnet doped with Tb^{3+} and Yb^{3+} ions were investigated. The measurements were made by a resonance method in the interval 4.2-300K. Strong anomalies of the magnetoelastic behavior of the investigated crystals were observed for definite magnetization directions at low temperatures. (16 refs.)

67987 Effect of a weak magnetic field on the acoustic properties of terbium near magnetic phase transitions. D.I.Anikeev, L.K.Zarembo, S.N.Karpachev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1665-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2938-41 (Oct. 1982). [received: April 1983]
The acoustic properties (velocity of sound, damping, and the acoustic nonlinearity parameter) of the rare earth metal terbium were studied in the temperature range 220-240K (longitudinal waves in the direction of the hexagonal c crystal axis) for different values of the applied magnetic field. Anomalous behavior of the acoustic properties of Tb was observed in the vicinity of the Neel (~231K) and Curie (~228K) points. The temperature dependences of the damping and of the acoustic nonlinearity parameter of Tb were found to differ considerably for the measurements performed during the cooling and heating of a sample. The magnitude of the nonlinearity parameter Γ in the neighbourhood of a transition from the paramagnetic to the antiferromagnetic phase was approximately ten times greater than for most metals. (5 refs.)

67988 Scattering of volume magnetostatic spin waves by a surface acoustic wave. A.M.Mednikov, S.A.Nikitov, A.F.Popkov.
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1702-5 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3008-13 (Oct. 1982). [received: April 1983]
A theoretical and experimental study was made of the propagation of volume magnetostatic spin waves in an yttrium iron garnet film in the presence of a surface acoustic wave of much lower frequency. A strong collinear scattering of the spin wave was observed in narrow resonance regions (nontransmission bands), where the conditions for it to be inelastically scattered by the surface wave were satisfied. As well as the interaction of like modes, scattering with transformation of various spin wave volume modes was also observed. The width of the nontransmission band in the spin wave natural frequency spectrum in the presence of the surface acoustic wave was calculated. The calculation was compared with the experimental results. (11 refs.)

67989 Magnetoelastic effect in the excitation of the steel by elastic oscillations. L.S.Pravdin (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.613-17 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.39-44 (Aug. 1982). [received: April 1983]
Investigations were conducted into the dependence of the magnetoelastic variable and constant relaxation irreversible changes in induction due to the magnetic field in steel elastic wave. The qualitative agreement of these dependences with the dependence of the magnetoelastic reversible and irreversible increments of induction on the field in the quasistatic application of stresses has been established. The effect of the excitation of the specimens by elastic oscillations at resonance frequency on the dependence of alternating induction on their hardness was examined on steel U8 specimens. The unambiguous dependence of the irreversible variation of induction on the hardness of the specimens of the U8 and 30KhGS steels was obtained. (5 refs.)

76.20 GENERAL THEORY OF RESONANCES AND RELAXATION

67991 Dipolar correlation function and motional narrowing in finite two-dimensional spin systems. J.-P.Korb, D.C.Torney, H.M.McConnell (Stauffer Lab. for Phys. Chem., Stanford Univ., Stanford, CA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5782-9 (1 May 1983).
A statistical treatment is used to describe the dipole-dipole relaxation processes of spins $S=1/2$ diffusing on finite two-dimensional ($2D$) surfaces. This leads to a general expression for the dipolar correlation function $G(\tau)$ including pairwise autocorrelation and cross-correlation terms. The authors show that for a finite $2D$ planar surface, $G(\tau)$ decays faster than that for an infinite planar surface. For finite $2D$ planar surfaces, dipolar translational correlation times, $\bar{\tau}_c$ are expressed in terms of the diffusion coefficient, the distance of closest approach between spins, and the area of the surface. It is shown that there is rapid motional line shape narrowing for sufficiently small two-dimensional surfaces. The calculation of resonance line shapes for the infinite $2D$ surface is discussed, but remains an unsolved problem when the only relaxation processes are those that arise from intermolecular dipolar interactions. 76.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

67992 Modulation spectrum from an electron-spin-resonance line. B.Rakvin, T.Islam, I.Miyagawa (Dept. of Phys. & Astron., Univ. of Alabama, University, AL, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1313-15 (25 April 1983).
A new type of spectrum was obtained from an inhomogeneously broadened ESR line under multiple modulation when one of the modulation frequencies was swept. Each spectral line appeared to be equivalent to the individual spin packet of the ESR line. (12 refs.)

Dynamical averaging of two symmetry-related magnetic resonance tensors in single crystals ....See Entry 64926

76.30D Ions and impurities: general

67993 The nature of the Jahn-Teller effect in the copper-doped hexaimidazole zinc dichloride tetrahydrate complex. C.P.Keijzers, T.Jansen, E.de Boer, G.van Kalkeren (Dept. of Phys. Chem., Univ. of Nijmegen, Nijmegen, Netherlands).
J. Magn. Resonance (USA), vol.52, no.2, p.211-20 (April 1983).
The $Cu(Im)_6^{2+}$ (Im=imidazole) ion doped into the triclinic zinc host crystal $Zn(Im)_6Cl_2.4H_2O$ was reexamined with X-and Q-band single-crystal EPR spectroscopy over the temperature range 4 to 300K. Contrary to the earlier study, which characterized this system as an example of Jahn-Teller tunneling between three tetragonally elongated configurations, it was found from the authors' more extensive measurements, that the $Cu(Im)_6^{2+}$ ion represents an example of strong Jahn-Teller coupling. Below the transition temperature from dynamic to static behavior, two wells in the 'Mexican hat' potential energy surface are preferentially and almost equally occupied. The g and hyperfine tensors for these two sites are consistent with the tetragonally elongated geometry typically found for the static Jahn-Teller effect in CuL_6^{2+} systems. At higher temperatures the third site becomes populated leading to a near isotropic spectrum at room temperature. Measurement of the variation of g and hyperfine coupling with temperature leads to an approximate value of 100 to 150 cm^{-1} for the height of the barrier separating this third site from the two lower energy sites. Examination of the structure of the host crystal allows an understanding of the observed EPR behavior. (15 refs.)

76.30F Iron group (3d) ions and impurities (Ti-Cu)

67994 Ground state wavefunction of copper(II) in 2,2′,2″-triaminotriethylamineisothiocyanatozinc(II) matrix. B.A.Sastry, S.Md.Asadullah (Molecular & Solid State Phys. Lab., Phys. Dept., Osmania Univ., Hyderabad, India), G.Ponticelli.
Indian J. Pure & Appl. Phys., vol.20, no.12, p.996-8 (Dec. 1982). [received: April 1983]
EPR studies have been carried out on the polycrystalline sample of copper-doped 2,2′,2″-triaminotriethylamineisothiocyanatozinc(II) at X- and Q-band frequencies, to obtain the spin-Hamiltonian parameters. The site symmetry of copper(II) in the abovel matrix is found to be compressed trigonal bipyramidal characterized by the following spin-Hamiltonian constants: $g_x=2.193$, $g_y=2.100$, $g_z=2.034$, $A_x=104.0\times M10^{-4}$ cm^{-1}, $A_y=93.3\times10^{-4}$ cm^{-1} and $A_z=107.6\times10^{-4}$ cm^{-1}. The ground state wavefunction calculated from the above parameters comes out to be: $\psi^{\alpha}=0.9932|z^{2\alpha}> +0.1045|x^2-y^{2\alpha}> +i0.0406|xy^{\alpha}> -i0.0275|yz^{\beta}> -0.0159|xz>$. (18 refs.)

67995 ESR study of the normal-incommensurate phase transition in $Sr_2Nb_2O_7$. Y.Akishige, T.Kubota, K.Ohi (Dept. of Phys., Waseda Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1290-7 (April 1983).
Temperature dependence of ESR line shape associated with Fe^{3+} in $Sr_2Nb_2O_7$ has been studied. The line shape is analyzed in terms of the incommensurate modulation of the fine structure tensor (D and E). The plane wave modulation model is a good approximation in the temperature range from 220°C to 120°C. The critical index β for the amplitude of the modulation wave is 0.34 ± 0.02 in the temperature range. Below 120°C, the soliton model is a good description for the modulation wave. (16 refs.)

67996 Structural phase transition study of $NiCl_2H_2O$ by EPR. K.R.Juraitis, J.B.Domiciano (Dept. de Fisica, Univ. Estadual de Londrina, Londrina, Brazil), W.Sano.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.531-3 (1983).
A single EPR line of isotropic and Lorentzian form was observed in a crystal of $NiCl_2H_2O$ between 113 and 300K. During a cooling run a sudden line broadening was observed at 200K associated with a known crystallographic phase transition. On heating, the corresponding transition temperature was 220K. The EPR spectra are interpreted in terms of a modified Anderson and Weiss model. The crystal field parameter is determined as D=0.81K and D=1.07K above and below the transition temperature, respectively. (10 refs.)

67997 An ESR study of phase transitions in crystals of $M(BF_4)_2.6H_2O$ (M=Fe, Co, Ni, Zn). A.K.Jain, M.Geoffroy (Dept. of Chem. Phys., Univ. of Geneva, Geneva, Switzerland).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.525-48 (1983).
From a temperature dependent ESR study of Mn^{2+}-doped crystals of $M(BF_4)_2.6H_2O$, M≡Zn, Co and Ni, new structural phase transitions have been detected and studied. First order structural phase transitions occur in $Co(BF_4)_2.6H_2O$ at $T_1\sim281K$, $T_2\sim189K$ and $T_3\sim172K$ (during cooling), in $Zn(BF_4)_2.6H_2O$ at $T_1\sim286K$ and in $Ni(BF_4)_2.6H_2O$ at $T_1\sim301K$. A continuous phase transition occurs in $Co(BF_4)_2.6H_2O$ at $T_p\sim257K$, in $Zn(BF_4)_2.6H_2O$ at $T_p\sim277$ K and in $Ni(BF_4)_2.6H_2O$ at $T_p\sim294K$. The ESR spectral characteristics suggest similarities in the structures of these fluoroborate compounds in the phase above T_1 with the room temperature structure of $Mg(ClO_4)_2.6H_2O$. All these compounds are found to have a tendency to crystallise in a triply-twinned pseudo-hexagonal form, although the unit cell above T_1 is found to be orthorhombic. The structural changes related to the water octahedron around the metal at T_1 were found to be very small and basically the same for these three compounds. Although the unit cell structure of $Fe(BF_4)_2.6H_2O$ above the first phase transition temperature T_1 was found to be similar to that of the other fluoroborate compounds, the structural changes occurring at T_1 appeared to be quite different. The low temperature thermal behaviour differs considerably in the Co, Fe and Zn compounds. (30 refs.)

67998 EPR detection and study of new phase transitions in $Mg(ClO_4)_2.6H_2O$. A.K.Jain (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India), G.C.Upreti.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.549-57 (1983).
A temperature dependent EPR study of Mn^{2+} impurity-doped crystals of $Mg(ClO_4)_2.6H_2O$ has led to the detection of two critical temperatures $T_1\sim335K$ and $T_2\sim324K$ where the EPR characteristics undergo distinct changes. The monoclinic distortion of the water octahedron around the metal ion shows little temperature dependence between T_1 and T_2, and T_2 and $T_3\sim272K$, while it is found to be comparatively strongly temperature dependent above T_1 and below T_3, decreasing as T approaches T_1 from the high temperature side and as T approaches T_3 from the low temperature side. At room temperature the water-perchlorate symmetry seems to deviate slightly from the perfect $P6_3mc$ symmetry proposed from previous X-ray measurements by West. Although the space symmetry group of the unit cell appears to remain unchanged at T_1 and T_2, the temperatures T_1 and T_2 are suspected to be related to structural phase transitions in this crystal. (26 refs.)

67999 ESR study of the structure of Fe (III) in silicate glasses of different basicities. B.Camara (Inst. fur Werkstoffwissenschaften III, Univ. Erlangen, Nurnberg, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.165-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Li, Na, K, Cs silicate glasses which contain various iron concentrations were investigated by ESR. The basicity of these glasses was also determined. The systematic behaviour of Fe^{3+} in these glasses shows clearly that the resonance g=4,2 represents Fe^{3+} in 'tetrahedral' coordination and g≈2 Fe^{3+} in 'octahedral' position. (11 refs.)

68000 ESR of Fe^0 and Cr^0 impurities in silicon for arbitrary SHF power levels. A.A.Bugai, V.M.Maksimenko, E.V.Mozdor, A.B.Roitsin.
Kvantovaya Elektron., Kiev (USSR), no.23, p.53-64 (1982). In Russian.
Theoretically and experimentally investigates the ESR spectra of Fe^0 and Cr^0 in Si at arbitrary levels of incident SHF radiation and at various temperatures. The parameters of ESR spectral lines corresponding to high power levels of the incident electromagnetic waves and to the forbidden transition ($\Delta M=+2$) are studied. (24 refs.)

68001 Vacuum annealing effects in lithium niobate. J.L.Ketchum, K.L.Sweeney, L.E.Halliburton (Phys. Dept., Oklahoma State Univ., Stillwater, OK, USA), A.F.Armington.
Phys. Lett. A (Netherlands), vol.94A, no.9, p.450-3 (4 April 1983).
A series of undoped $LiNbO_3$ crystals have been subjected to heat treatments in a reducing atmosphere, i.e. a vacuum. Electron spin resonance spectra of Fe^{3+} and Mn^{2+} ions, infrared absorption of OH^- molecules, and optical absorption peaking near 500 nm were observed to change as a function of annealing temperature. After reduction above 700°C, subsequent optical bleaching near 77K significantly enhanced a Nb^{4+} electron spin resonance spectrum. (18 refs.)

68002 Absorption spectra of Ti^{3+} in titanite. K.B.N.Sarma, B.J.Reddy, S.V.J.Lakshman (Spectroscopic Labs., S.V. Univ., Tirupati, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.636-41 (Nov. 1982). [received: April 1983]
Optical and ESR absorption studies are reported on titanite. From the ESR spectrum of the sample, the g-factors are measured. (16 refs.)

68003 Electron paramagnetic resonance and ENDOR studies of Cr^{3+}-Al^{3+} pairs in forsterite. L.V.Bershov (Acad. of Sci., Moscow, USSR), J.-M.Gaite, S.S.Hafner, H.Rager.
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.95-101 (1983).
The electron paramagnetic resonance (EPR) spectrum of Cr^{3+} in synthetic crystals of forsterite consists primarily of lines of Cr^{3+} 'isolated' at the $M1$ and $M2$ positions in a 'perfect' crystal environment without local charge compensation. In addition it shows two nonequivalent superhyperfine-split sextets with different intensities which are due to strong interaction of the Cr^{3+} electron spin S ($S=3/2$) with an adjacent nuclear spin I($I=5/2$). Electron nuclear double resonance (ENDOR) experiments revealed that the sextets result from Cr^{3+} ($M1$)-Al^{3+} and Cr^{3+}($M2$)-Al^{3+} pairs, Al being located at adjacent tetrahedral Si sites. The **g**, **D**, **A**, and **A′** tensor components of the Cr^{3+}-Al^{3+} pairs have been determined at room temperature. The values of the pairs are distinct although they are not very different from the corresponding data of 'isolated' Cr^{3+}. From the intensities of the EPR spectra the relative concentration of the Cr^{3+}-Al^{3+} pairs with respect to 'isolated' Cr^{3+} has been estimated. (19 refs.)

68004 Spin-lattice relaxation of Fe^{3+} in cubic ZnS. V.Ya.Bratus', Yu.G.Semenov (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1615-16 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2849-51 (Sept. 1982). [received: April 1983]
The authors clarify the causes of the observed shortening of the spin-lattice relaxation times of Fe^{3+} in cubic ZnS and determine the relaxation mechanisms in the range of one- and two-phonon processes. (10 refs.)

68005 EPR of Mn^{2+} in the *N*, *R*, and *Q* phases of sodium niobate. I.N.Geifman, I.P.Bykov, B.K.Krulikovskii (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.10, p.1793-4 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3161-3 (Oct. 1982). [received: April 1983]

Sodium niobate displays the most complex behavior of the known perovskite ferroelectrics, having both antiferroelectric and ferroelectric states. Above 914K it is a paraelectric. As the temperature is lowered the crystal undergoes a series of structural phase transitions. The authors present the results of EPR studies of NaNbO$_3$:Mn^{2+} in the N, R and Q phases. (12 refs.)

68006 ESR of Mo^{5+} in Na$_2$Mo$_2$O$_7$ single crystals. V.S.Grunin, I.B.Patrina, Z.N.Zonn (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1621-3 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2859-61 (Sept. 1982). [received: April 1983]

The authors consider the Mo^{5+} ESR spectra of Czochralski grown Na$_2$Mo$_2$O$_7$ at 77K. There are no paramagnetic centers in the initial single crystals. Reduction in a CO atmosphere leads to the appearance of electrons in the molybdenum sublattice. Three types of Mo^{5+} ion were observed depending on the form of the impurity and the reduction temperature. Only the spectrum of Mo$_1$$^{5+}$ ions was observed in the impurity-free single crystals and in single crystals with WO$_3$ impurity. It consists of an intense central line and six satellites, corresponding to the odd isotopes ^{95,97}Mo (I=5/2) with close nuclear magnetic moments. (7 refs.)

76.30K Rare-earth ions and impurities

68007 Electron spin resonance of Gd^{3+} in triacetate tetrahydrates of Sm, Nd, Er, Y, Yb, and Dy. S.K.Misra, M.Bartkowski, P.Mikolajczak (Phys. Dept., Concordia Univ., Quebec, Montreal, Canada).

J. Chem. Phys. (USA), vol.78, no.9, p.5369-72 (1 May 1983).

An EPR study of Gd^{3+}-doped single crystals of triacetate tetrahydrates of Sm, Nd, Er, Y, Yb, and Dy has been made in order to study the sytematics of EPR spectra in these homologous isostructural hosts at various temperatures. The absolute signs of the spin Hamiltonian parameters are determined from intensities of lines at liquid helium temperatures. The parameters are evaluated using a rigorous least-squares fitting procedure. As far as the systematics of the parameters are concerned, it is found that while the parameter b_2^2 varies linearly, the parameter b_2^0 varies approximately linearly with the atomic radius of the host rare-earth ion. The EPR studies presented here suggest a monoclinic symmetry at the site of the rare-earth ions in the rare-earth triacetate tetrahydrate crystals investigated. As well, all rare-earth sites are found to be magnetically equivalent. The EPR data also suggest that the Nd host undergoes some structural change at about 238K. (17 refs.)

68008 Paramagnetic species in NaCl:Ca,Cu crystals irradiated at RT. N.Takeuchi, K.Inabe, S.Nakamura (Faculty of Technol., Kanazawa Univ., Kanazawa, Japan).

Phys. Status Solidi b (Germany), vol.116, no.1, p.K5-8 (1 March 1983).

Color centers formed in LiF:Mg, Ti(LiF TLD-100) crystals are considered to be intimately related to their thermoluminescence (TL) properties. The authors examine the paramagnetic species in γ-irradiated NaCl:Ca, Cu crystals by ESR measurements with the hope that through this study some information to help the understanding of the TL mechanism in LiF TLD-100 could be obtained. (6 refs.)

68009 Superhyperfine interaction of an Nd^{3+} tetragonal center in a calcium fluoride single crystal. R.P.Akhaladze, B.G.Berulava, R.I.Mirianashvili, O.V.Nazarova, T.I.Sanadze (State Univ., Tbilisi, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.10, p.1669-72 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2946-51 (Oct. 1982). [received: April 1983]

The RF discrete saturation (RFDS) method was used to study the superhyperfine (SHF) interaction of an Nd^{3+} tetragonal center in a calcium fluoride single crystal. The magnitudes and signs of the tensor components were found for the SHF interaction with fluorine nuclei in the first and second coordination spheres and with the nucleus of a charge-compensating fluorine ion. The SHF interaction parameters are proposed for the first time for noncubic centers, and are used in a qualitative treatment of covalence effects in the Nd^{3+} SHF interaction in calcium fluoride, as well as in a comparison with the SHF interaction of the isoelectronic actinide ion U^{3+} in the same host material. From the results, local distortions of the lattice near Nd^{3+} are determined, which result from the replacement of a lattice cation by an Nd^{3+} ion and from the acquisition of the charge-compensating fluorine ion; the characteristic parameters of these distortions are determined. (12 refs.)

68010 The EPR spectrum of neodymium in crystals of the scheelite series at high pressure. S.V.Kasatochkin (Inst. of High-Pressure Phys., Acad. of Sci., Troitsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.10, p.1800-1 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3172-4 (Oct. 1982). [received: April 1983]

The crystal field splitting of the ground state of CaWO$_4$ and CaMoO$_4$ have been studied using Nd^{3+} EPR spectra. The dependence of the g-factor on Nd-O interatomic distance is studied by varying the applied hydrostatic pressure. (10 refs.)

68011 ESR and spin-lattice relaxation of Nd^{3+} in silicates of various structures. I.N.Kurkin, K.P.Chernov (Ul'yanov (Lenin), Kazan.Kazan Univ.,USSR).

Sov. Phys. J. (USA), vol.25, no.7, p.610-12 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.35-8 (July 1982). [received: May 1983]

ESR studies have been made on Nd^{3+} in certain orthosilicate and pyrosilicate single crystals. It is found that Nd^{3+} ions produce a type of activator center, and the principal values of the chief factors have been measured. The ESR spectra are compared with structural data on the crystals. The spin-lattice relaxation gives the positions of the nearest excited Stark level of Nd^{3+} in the silicates. (6 refs.)

68012 ESR studies of radiation-induced tin centers in oxide glasses. H.Kawazoe (Dept. of Industrial Chem., Tokyo Metropolitan Univ., Tokyo, Japan), J.Nishii, H.Hosono, T.Kanazawa, H.Imagawa.

J. Phys. Colloq. (France), vol.43, no.C-9, p.155-8 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Electronic and geometrical structures around Sn^{2+} and Sn^{4+} dissolved in 25Na$_2$0.75SiO$_2$ glass were determined by use of the photon-induced defects centered on a tin atom as an ESR probe. A trapped electron center (Sn^{2+})$^-$ and trapped hole center (Sn^{4+})$^-$ were detected in the glasses prepared under reducing or oxidizing condition, respectively. The precursor ion Sn^{2+} was found to be in tetragonally pyramidal coordination, the lone pair on Sn^{2+} occupying sp^n type hybrid. Sn^{4+} was considered to be in an ionic coordination of spherical symmetry. (13 refs.)

68013 ESR studies on stereochemistry of thallous ion in oxide glasses. H.Hosono, Y.Abe, H.Kawazoe (Dept. of Inorganic Materials, Nagoya Inst. of Technol., Nagoya, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.159-63 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

The stereochemistry of Tl$^+$ in a wide variety of oxide glasses has been elucidated by analyzing ESR spectra of γ-induced paramagnetic Tl^{2+} employing a newly developed solution to the spin-Hamiltonian. It has been found that there exist two types of the coordination, Tl$^+$ with a nearly spherical-symmetric ligand coordination has appeared in the glasses where bridging and non-bridging oxygen coexist. The Tl^{2+} center produced from coordination II has relaxed into the center similar to that from coordination I on thermal annealing of as-irradiated specimens. A structural model involving the displacement of alkali ion has been proposed on the basis of the kinetical analysis of the conversion. (7 refs.)

68014 ESR studies on arsenic-associated centers in oxide glasses produced by gamma-irradiation. H.Imagawa, H.Hosono, H.Kawazoe (Toshiba Res & Dev. Center, Toshiba Corp., Kawasaki, Japan).

J. Phys. Colloq. (France), vol.43, no.C-9, p.169-72 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Two kinds of new As-associated centers in γ-irradiated 16Na$_2$O.11CaO.73SiO$_2$:0.1AsO$_x$ glass were identified by ESR experiments. The nearly isotropic hyperfine quartet produced by a ^{75}As nucleus (I=3/2, N.A.≒100%) appearing in oxidized glass (O-signal) was assigned to an electron-trap center originating from a precursor As^{5+} ion. The HF quartet of axial symmetry observed in reduced glass was attributed to a hole-trap center originating from an As^{3+} ion. ESR parameters were evaluated by use of a line shape simulation technique. LCAO coefficients were derived from the parameters. The structure models for the centers were proposed on the basis of the coefficients: the electron-trap center, (As^{5+})$^-$, has a tetrahedral coordination, the trapped electron locating on an As-O antibonding MO; the hole-trap center, (As^{3+})$^+$, has a trigonally pyramidal coordination, the hole occupying a nonbonding As sp^3 hybridized orbital. (17 refs.)

68015 ESR studies of donor clusters in silicon. D.New, T.Castner (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.128-30 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

ESR spectra for Si:P and Si:As samples with donor concentrations ranging from 9×10^{16} to 5×10^{17}/cc have been obtained in the range 4.2K to 20K at 9 GHz. d_χ''/dH spectra were integrated to obtain χ''(N,T,H) allowing the determination of relative contributions from different size clusters. The ratio of integrated intensity of the outer lines to the total integrated intensity obeys Poisson statistics and yields a characteristic volume V_c for Si:P of 8.21×10^6 Å^3. A search outside the isolated donor hyperfine lines has revealed no extra transitions 0.03% of the outer hyperfine lines. A new many-electron cluster hyperfine interaction is formulated which takes account of topological disorder for larger clusters. The effect of hyperfine topological broadening and cluster-cluster interactions on the ESR line widths and shapes are considered. (11 refs.)

68016 Vacancy centers in single crystals in Bi$_{12}$RO$_{20}$(R=Si, Ti, Ge). A.P.Eliseev, V.A.Nadolinnyi, V.A.Gusev (Inst. of Inorganic Chem., Acad. of Sci., USSR).

J. Struct. Chem. (USA), vol.23, no.3, p.484-5 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.181-2 (May-June 1982). [received: Feb. 1983]

The crystals of oxygen-containing compounds of bismuth Bi$_{12}$RO$_{20}$ with Si, Ti, and Ge as the second metal R, belonging to the acentric class 23 of the cubic system (sillenite structure) are at present regarded as promising materials for extensive application in optoelectronic instruments, in particular in systems for the optical memorization, processing, and storage of information. An important task in the improvement of the characteristics of these instruments is the determination of the nature of the local centers reponsible for definite parameters. EPR and optical spectroscopy have been used to study the nonalloyed industrial crystals grown by the Czochralski method from a melt with the stoichiometric composition and containing, according to spectral analysis data, not more than 10^{-4} wt.% impurity. (4 refs.)

68017 Electronic spin of the Ga vacancy in GaP. T.A.Kennedy, N.D.Wilsey, J.J.Krebs, G.H.Stauss (Naval Res. Lab., Washington, DC, USA).

Phys. Rev. Lett. (USA), vol.50, no.17, p.1281-4 (25 April 1983).

EPR experiments with uniaxial stress on the Ga vacancy V_{Ga} in GaP reveal that its spin is $^3/_2$. The spectrum splits linearly with stress into three components with a coefficient $C_{11}=34\times10^{13}$ cm^{-1} (dyn/cm^2)$^{-1}$ at 20K. The high spin demonstrates the importance of the exchange interaction for this vacancy. (16 refs.)

68018 The AsO_4^{4-} center in CsH_2AsO_4: a Halperin-Varma defect moving in a single well potential. P.S.S.Guimaraes, R.Gazzinelli, G.M.Ribeiro, A.S.Chaves (Dept. of Phys., Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
Solid State Commun. (USA), vol.46, no.7, p.513-16 (May 1983).
The ESR of the AsO_4^{4-} center in CsH_2AsO_4 is investigated from 4.2K to 270K. The behavior of this paramagnetic center is essentially different from its behavior in the other members of the KDP family. Two properties of the center are remarkable: it seems to behave like a Halperin-Varma kind of defect and to move classically in a single-well potential which can be represented to a very good approximation by a square well. (19 refs.)

68019 Investigation of dislocations in silicon by the ESR method. V.V.Kveder, Yu.A.Osip'yan (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1246-8 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1930-3 (Nov. 1982). [received: April 1983]
The main results of an investigation of dislocations in silicon by the ESR method are presented briefly. It is shown that plastic deformation creates paramagnetic centers which can be attributed unambiguously to chains of dangling dislocation bonds. A structural transition clearly occurs in such chains below 50K. The available data demonstrate the existence of one-dimensional phonons localized at dislocations. (12 refs.)

68020 Paramagnetic centers in α-$LiIO_3$ single crystals activated with nickel. M.L.Meil'man, V.F.Karyagin, V.O.Martirosyan (All-Union Engng.-Construction Inst. Correspondence School, Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1788-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3154-6 (Oct. 1982). [received: April 1983]
It has been observed that impurities of transition metals (for instance, chromium, iron, nickel, etc.) have a pronounced effect on the properties of α-$LiIO_3$ crystals. Therefore, the study of color centers formed by impurity ions of transition elements is of both scientific and practical interest. The authors report the results of a study of the electron paramagnetic resonance (EPR) spectra of single crystal lithium iodate. The crystals were grown from water solution with an admixture of nickel salts. (6 refs.)

76.30P Conduction electrons

68021 Theoretical and experimental studies of uniaxial stress enhanced spin-flip transitions in n-InSb. M.Kriechbaum (Inst. of Theoretical Phys., Univ. Graz, Graz, Austria), R.Meisels, F.Kuchar, E.Fantner.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.444-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Theoretical and experimental studies concerning spin-flip transitions of conduction band electrons in pure InSb under uniaxial stress in different crystallographic orientations are presented. From the magnetic field dependence of the $0^+ \rightarrow 0^-$ transition a zero-field value of -51 is obtained for the effective Lande factor in good agreement with theoretical results. The uniaxial stress enhancement of the spin resonance is strongly anisotropic being very weak for stress X parallel to [100]. From absorption data for $X \| [\bar{1}10]$ a value of 1.6 ± 0.5 eV is obtained for the deformation potential C_2. The variation of g^* on stress is less than about 0.5% at 1 kbar. (9 refs.)

68022 Optical spin orientation. Application to the study of photoelectron kinetics. V.I.Safarov, A.N.Titkov (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.497-501 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Recent results obtained with the use of the optical spin orientation method on spin relaxation, recombination and transport of photoelectrons in III-V compounds are presented. (36 refs.)

76.30R Free radicals

68023 An EPR study of the reaction between poly(*p*-phenylene sulfide) and electron-acceptor dopants. L.D.Kispert, L.A.Files (Dept. of Chem., Univ. of Alabama, Tuscaloosa, AL, USA), J.E.Frommer, L.W.Shacklette, R.R.Chance.
J. Chem. Phys. (USA), vol.78, no.8, p.4858-61 (15 April 1983).
EPR spectra for electron-acceptor doped poly(*p*-phenylene sulfide) are reported. The *g* values obtained from these spectra correspond to an electron density centered around a divalent sulfur radical cation R-S-R. This assignment is supported by corresponding EPR data from an oligomeric model compound ϕ-S-ϕ-S-ϕ (ϕ=phenyl). The *g* value of the sulfur-based radical cation of doped poly(*p*-phenylene sulfide) distinctly contrasts the nearly free electron *g* values obtained from EPR measurements on poly(*p*-phenylene) and its oligomer *p*-terphenyl. (19 refs.)

68024 Geometric model of trapped electrons in trehalose single crystals X-ray irradiated at 3K. An EPR study. P.-O.Samskog, L.D.Kispert (Chem. Dept., Univ. of Alabama, Tuscaloosa, AL, USA), A.Lund.
J. Chem. Phys. (USA), vol.78, no.9, p.5790-4 (1 May 1983).
Three different radicals were identified by EPR in X-ray irradiated single crystals of trehalose at 3K. The species are the trapped electron, a hydroxy alkyl radical, and an alkoxy radical. The electron is trapped in an intermolecular site formed by two hydroxyl groups, one on the carbohydrate and the other on a water molecule is evidenced by the anisotropic proton hyperfine couplings. A geometric model for the trapping site is presented. The trapped electron decays by cleavage of an OH bond and the liberated hydrogen atom abstracts another hydrogen atom from an adjacent carbon atom forming a hydroxy alkyl radical. The site of the alkoxy radical has been identified. The primary reaction mechanism is discussed. (16 refs.)

76.40 DIAMAGNETIC AND CYCLOTRON RESONANCES

68025 The cyclotron resonance linewidth in two-dimensional electron accumulation layers in InSe. E.Kress-Rogers, R.J.Nicholas (Clarendon Lab., Oxford Univ., Oxford, England), A.Chevy.
J. Phys. C (GB), vol.16, no.12, p.2439-48 (30 April 1983).
In InSe electron accumulation layers are formed in the vicinity of stacking faults with charged impurities adsorbed to the defect plane. In this two-dimensional system the dependence of the cyclotron resonance linewidth on magnetic field is significantly different from silicon n-channels and from inversion layers at heterojunction interfaces. While in the latter the linewidth is dominated by short-range scattering and thus follows a $B^{1/2}$ dependence, the CR linewidth in InSe does strongly decrease with increasing magnetic field for intermediate fields and saturates for higher fields. This behaviour can be quantitatively described as due to neutral impurity scattering via a gaussian potential with a range comparable with or larger than the cyclotron radius. At high magnetic fields, screened Coulomb scattering and deformation potential scattering also contribute. (21 refs.)

68026 Oscillations of the cyclotron resonance linewidth with Landau level filling factor in GaAs/AlGaAs heterostructures. T.Englert, J.C.Maan, Ch.Uihlein (Max-Planck-Inst. fur Festkorperforschung, Grenoble, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.631-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The linewidth of cyclotron resonance in a 2D electron gas in GaAs/AlGaAs heterojunctions shows oscillations between 0.070 T and 0.32 T as a function of the resonance magnetic field at 5K. With increasing temperature the maximum linewidth decreases, whereas the minimum increases. This oscillatory behaviour is shown to be correlated with the filling factor of Landau levels. (9 refs.)

68027 Far-infrared shifted cyclotron resonance in a charge-density-wave system, $NbSe_3$. R.J.Wagner (Naval Res. Lab., Washington, DC, USA), N.P.Ong.
Solid State Commun. (USA), vol.46, no.7, p.491-5 (May 1983).
Cyclotron resonance studies on the charge-density-wave metal $NbSe_3$ at 2K reveal two types of free carriers (with effective mass 0.18 m_0 and 0.71 m_0 respectively). The measured lifetimes agree with earlier estimates of the DC mobility. An unexplained shift of the resonance field of the form $\omega_0^2+\omega_c^2$ is observed when the laser electric field is polarized perpendicular to the chain direction. (14 refs.)

68028 Observation of oscillatory linewidth in the cyclotron resonance of GaAs-Al_xGa_{1-x}As heterostructures. T.Englert, J.C.Maan, C.Uihlein (Hochfeld-Magnetlabor, Max-Planck-Inst. fur Festkorperforschung, Grenoble, France), D.C.Tsui, A.C.Gossard.
Solid State Commun. (USA), vol.46, no.7, p.545-8 (May 1983).
The linewidth of the far infrared cyclotron resonance in the 2-D electron gas in GaAs-Al_xGa_{1-x}As heterojunctions shows oscillations between 0.070 and 0.32 T as a function of the resonance magnetic field at 5K. With increasing temperature the maximum linewidth decreases, whereas the minimum increases. This oscillatory behavior can be correlated with the filling factor of the Landau levels. (10 refs.)

68029 Cyclotron resonance and impurity absorption in tellurium under pressure in the submillimeter range. M.I.Eremets, S.G.Lyapin, U.Steigenberger, V.G.Veselago, E.A.Vinogradov, E.S.Itskevich, Yu.V.Kosichkin, M.von Ortenberg, A.M.Shirokov (Inst. of High-Pressure Phys., Acad. of Sci., Troitsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1667-8 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2942-5 (Oct. 1982). [received: April 1983]
Submillimeter magnetospectroscopy was used to study the band structure of semiconductors under hydrostatic pressure. The main features of this technique are: (1) the use of a liquid optical constant-pressure chamber with an axial symmetry, (2) recording radiation with a detector placed just behind the sample in the pressurized region, (3) the use of a backward-wave tube as the radiation source. The cyclotron resonance spectra and impurity levels of tellurium were recorded with high resolution at pressures up to 6 kbar. Two groups of impurity lines were found, behaving differently under pressure: this seems to indicate that the acceptor impurities responsible for them are different in physical nature. (10 refs.)

68030 Spin-cyclotron-phonon resonance in semiconductors with inversion asymmetry. A.D.Margulis, Vl.A.Margulis (N.P. Orgarev Mordovian State Univ., Saransk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1713-16 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3026-32 (Oct. 1982). [received: April 1983]
A new mechanism of excitation of a spin-cyclotron-phonon resonance related to a spin flip interaction of electrons with longitudinal optical phonons is studied. The spin-cyclotron-phonon resonance occurs due to a relativistic term in the electron Hamiltonian, which is cubic in the momentum and leads to a spin splitting of the conduction band. The transformation of the electron spectrum caused by a resonance spin-phonon coupling (pinning effect) is discussed. (13 refs.)

76.50 FERROMAGNETIC, ANTIFERROMAGNETIC, AND FERRIMAGNETIC RESONANCES; SPIN WAVE RESONANCE

(see also 75.30D Spin waves)

68031 Approximate ferromagnetic resonance relations for (111) garnet films. M.Marysko (Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B32, no.11, p.1307-10 (1982).
The magnetic anisotropy of (111) garnet films is intensively studied with respect to their bubble domain applications. The measurement of the uniaxial and cubic anisotropy of these films can be performed using ferromagnetic resonance (FMR). In this method the anisotropy fields and g-factor are determined by fitting the calculated out-of-plane angular dependence of the resonance field in the plane $(\bar{1}10)$ in the measured dependence. Cronemeyer et al. (1975) have used this method making use of the simple resonance relations derived on the assumption that the vectors M and H are collinear. Recently, Makimo et al. (1981) have determined the anisotropy fields by numerical computing on the basis of the exact resonance relations derived on the assumption that the vectors M and H are collinear. Recently, Makimo et al. (1981) have determined the anisotropy fields by numerical computing on the basis of the exact resonance relations and have shown that neglect of the noncollinearity can affect the accuracy of determining the cubic anisotropy constant K_1. Approximate analytical resonance relations for the magnetic field rotating in the $(\bar{1}10)$ plane are derived correctly to first order in the angle deviation between M and H. These relations are more accurate than those used by Cronemeyer, and in most cases (for not too large anisotropies) they enable the author to calculate the angular dependences of the resonance field from relatively simple analytical expressions. (4 refs.)

68032 Magnetic resonance in $(C_2H_5NH_3)_2CuCl_4$ at low frequencies. V.N.Vasyukov, A.V.Zhuravlev, S.N.Lukin, V.T.Telepa.
Fiz. Nizk. Temp. (USSR), vol.9, no.4, p.429-32 (April 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The frequency-field dependence of the AFMR spectrum of $(C_2H_5NH_3)_2CuCl_4$ is investigated at the temperature 4.2K in the frequency range $\nu=10^{-3}$-2.6 *GHz* and field range 0-2.0 *kOe*. The values of the spin-flop transition field $H_{SF}=305\pm5$ *Oe*, exchange field $H_E=1410\pm10$ *Oe* and activation frequency of AFMR spectrum in zero magnetic field are determined, $\nu_c=1160\pm50$ *MHz*. (11 refs.)

68033 Magnetic and some crystalline properties of H^+ ion-implanted garnet layers: A study as a function of annealing treatment. G.Suran (Lab. de Magnetisme CNRS, Meudon-Bellevue, France), H.Jouve, P.Gerard.
J. Appl. Phys. (USA), vol.54, no.4, p.2006-18 (April 1983).
The magnetic properties—as determined by ferromagnetic resonance (FMR) measurements—lattice strain $\Delta a/a$ and variation of these parameters were studied as a function of annealing temperature T_{ann} in $(YSmLuCa)_3(FeGe)_5O_{12}$ bubble garnet films subjected to a triple implantation by H^+ ions. On the as-implanted sample the FMR spectrum and $\Delta a/a$ could not be measured. On samples annealed at 200°C three resonance peaks appear corresponding to three sublayers with different magnetic properties. The formation of the sublayers is related to the inhomogeneous distribution of H^+ ions along the implanted layer as a result of the triple implantation. For this range of T_{ann} the Curie temperature T_C, $\Delta a/a$, and the anisotropy fields vary strongly with annealing time. This result is related to the high diffusion rate of hydrogen and shows that the magnetic properties are substantially modified by the absorbed H^+ ions. When $T_{ann}>300°C$ the amount of H^+ incorporated becomes negligible, so the magnetic parameters and the value of $\Delta a/a$ are essentially determined by the lattice damage. The implanted layer becomes magnetically homogeneous as shown by a well-defined spin wave spectrum characteristic of a layer with fairly uniform magnetic properties along its thickness. For $300°C<T_{ann}<600°C$ increasing T_{ann} results in a decrease of $\Delta a/a$ and a restoration of the superexchange interaction between the *a* and *d* sites, as shown by the increase of T_C. The resonance linewidth ΔH_1 of the implanted layer is greatly reduced with respect to ΔH_0 of the bulk of the film, due to the fact that a large part of *c* site rare-earth ions are decoupled from the garnet system. As a consequence, K_u is negligible and λ_{111} is strongly reduced in the implanted layer. For $T_{ann}>630°C$ the rare-earth ions are progressively recoupled as shown by the increase of ΔH_1. As a result λ_{111} increases and K_u is partially restored. (27 refs.)

68034 Surface studies of amorphous metallic glass by magnetic resonance (Resonance surface studies of $Fe_{40}Ni_{40}B_{20}$). Z.Frait (Inst. of Phys., Czechosl. Acad. of Sci., Praha, Czechoslovakia).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.37-42 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Surface layer properties of amorphous ribbons of $Fe_{40}Ni_{40}B_{20}$ were studied by ferromagnetic resonances in the frequency range 9-105 GHz, at room temperature, at both sample surfaces. The values of effective magnetic polarization, g-factor, uniaxial in-plane anisotropy and linewidth parameter, evaluated from these measurements were compared with those pertinent to the interior of the sample obtained by the ferromagnetic antiresonance method. The origin of the observed differences is discussed. The spread of the local surface stray fields has been observed on a medium-range scale ($>1\mu m$) by the EPR of free radical thin layers. (61 refs.)

68035 Spin-wave resonance in single crystal nickel films. A.A.Hussain, J.S.S.Whiting (Dept. of Phys., Univ. of York, York, England).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.59-61 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The effect of substrate material and of sodium fluoride coatings on the pinning of spin-wave modes has been investigated in single crystal nickel films. (6 refs.)

68036 Photoinduced change in SWR spectra of Si-deposited YIG thin films. K.Uematsu, M.Deguchi, Y.Kito (Dept. of Phys., Waseda Univ., Tokyo, Japan).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.65-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
The SWR spectra and the photoinduced change of resonant fields in annealed Si-deposited YIG thin films are observed. The presence of the critical angle which changes with irradiation shows that the surface mode is excited. The annealing conditions effective to the change of the surface anisotropy are found. (8 refs.)

68037 Resonance of domain boundaries in single-crystal magnets. S.A.Kirov (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1610-12 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2842-4 (Sept. 1982). [received: April 1983]
The author has measured the dependence of the resonance frequencies of the domain boundaries on the magnetizing field H_0 in a bulk specimen of cubic ferrite. The results, as well as previously reported data, were shown to be satisfactorily explained in terms of a model of uniform rotation of the magnetization vector M inside the domain boundaries. Measurements of the FMR absorption spectra as a function of H_0 were carried out on a spherical monocrystalline specimen of nickel ferrite. (19 refs.)

68038 Paramagnetic and electric geometric resonances in antiferromagnetic semiconductors. I.N.Oleinik, V.L.Fal'ko (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1748-51 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3090-5 (Oct. 1982). [received: April 1983]
The paramagnetic properties of antiferromagnetic semiconductors in a strong static magnetic field H_0 and in the field of a strong electromagnetic wave are studied within the *s-d* exchange model. Paramagnetic and electric geometric resonances are predicted and their properties are studied. It is shown that a paramagnetic resonance represents a convenient method for the determination of the exchange interaction constant. (7 refs.)

76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

68039 Investigation of deviations from stoichiometry in copper selenide by the method of nuclear magnetic resonance. V.V.Gorbachev, Yu.B.Muravlev, G.A.Mustafaev (Moscow Inst. of Steel & Alloys, Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.1038-9 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1230-2 (July 1982). [received: Feb. 1983]
The possibility of using the NMR method was studied for the investigation of the characteristics of these copper chalcogenides $(Cu_{2-x}B^{VII})$ that arise when their composition deviates from stoichiometry. The investigations were conducted on crystalline samples of p-type $Cu_{2-x}Se$ with x=0-0.2. Since all the investigated samples possessed relatively large electric conductivity ($\rho\approx2.5\times10^{-5}$ Ω.m), they were pulverized to a particle size that permitted the influence of the skin layer on the shape of the NMR line to be neglected. The measurements were performed at 100 and 300K in a magnetic field with intensity 1.24×10^{-15} A/m. The shape of the NMR line for all the samples of different composition is well described by a Lorentzian curve, which is evidence of the applicability of the theory of Reif and Cohen. According to this theory, the quadrupole interactions that arise at low concentrations of point defects of an impurity lead to a symmetrical shift of the satellite lines and transformation of the Gaussian form of the line to a Lorentzian form. (6 refs.)

68040 A ^2H NMR study of the solid-phase behavior of nonadecane. M.G.Taylor, E C.Kelusky, I.C.P.Smith, H.L.Casal, D.G.Cameron (Nat. Res. Council of Canada, Ottawa, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.5108-12 (15 April 1983).
The ^2H NMR spectra of perdeuterononadecane and several specifically deuterated nonadecanes, in solid phases I (orthorhombic) and II (rotator), are reported. In phase I, the central portion of the chain is static on the time scale of 10^{-5} s; however, the chain ends are subject to torsional motions. In phase II, the chains undergo hindered rotation. The phase II spectra of the methylene groups located in the center of the chain can be simulated with a model in which the rigid chain undergoes 82° jumps between equivalent sites. However, this model is inadequate for the methyl and methylene groups near the chain ends. The data suggest higher amplitudes of torsional motion in these positions. (23 refs.)

68041 NMR study of ^{181}Ta in the commensurate charge density wave state of $1T\text{-}TaSe_2$ and $1T\text{-}TaS_2$. M.Naito, H.Nishihara, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. C (GB), vol.16, no.12, p.L387-93 (30 April 1983).
The ^{181}Ta NMR in $1T\text{-}TaSe_2$ and $1T\text{-}TaS_2$ has been studied at 4.2K using single crystals as well as powders in order to obtain detailed information of the superlattice structure in the commensurate charge density wave state. The results are discussed on the basis of the star-shaped cluster model and an effect due to the three-dimensional (3D) order of clusters is pointed out. (10 refs.)

68042 Deuteron NMR lineshape computations for tunnelling ND_4^+ ions. II. Exact treatment of quadrupolar interactions. Z.T.Lalowicz (Radiospectroscopy Div., Inst. of Nuclear Phys., Krakow, Poland), W.T.Sobol.
J. Phys. C (GB), vol.16, no.12, p.2351-62 (30 April 1983).
For pt.I see ibid., vol.11, p.4187 (1978). Effects of tunnelling rotation of ND_4^+ ions on ^2H-NMR lines are analysed. Detailed lineshape calculations are supplied. All terms in the quadrupolar Hamiltonian and secular dipolar interaction between deuterons are taken into account. Asymmetry and level crossing are characteristic features observed in the lineshapes. The latter effect makes measurement of the tunnelling frequency possible. Sets of theoretical lineshapes are presented showing their evolution with tunnelling splitting and with magnetic field. The main conclusion is that complete interpretation of a given ammonium compound (ground torsional level structure and tunnelling splitting value) requires measurement of the field dependence of the ^2H-NMR lineshape. (5 refs.)

68043 Deuteron NMR lineshape computations for tunnelling ND_4^+ ions. III. Level-crossing study for ND_4ClO_4. Z.T.Lalowicz (Radiospectroscopy Div., Inst. of Nuclear Phys., Krakow, Poland).
J. Phys. C (GB), vol.16, no.12, p.2363-73 (30 April 1983).
For pt.II see ibid., vol.16, p.2351 (1983). Deuteron NMR lines were measured in ND_4ClO_4 at 4.2K and at various magnetic fields from 0.63 to 1.48T. A remarkable number of lines were found to exhibit evolution in shape and width. This effect arises from level-crossing between Zeeman and tunnelling systems appearing around 0.85 T and around 1.45T. The theory of ^2H NMR spectra, from previous work, has been applied to the interpretation. Tunnelling splittings were estimated by fitting theoretical lineshapes and were found, for ND_4^+ in ammonium perchlorate, to be reduced by a factor of 304

with respect to those of NH_4. Rotational tunnelling effects in proton and dueteron NMR spectra are compared. (25 refs.)

68044 Anisotropy and asymmetry of the hyperfine spectrum of holmium in magnetically ordered RAl_2 alloys. P.R.Waind, I.S.MacKenzie, M.A.H.McCausland (Dept. of Phys., Univ. of Manchester, Manchester, England).
J. Phys. F (GB), vol.13, no.5, p.1041-56 (May 1983).
The hyperfine interaction of holmium in ferromagnetically ordered RAl_2 compounds has been studied by pulsed NMR at liquid helium temperatures. The seven-line NMR spectrum of ^{156}Ho has been observed in alloys for which the spontaneous magnetisation lies in different crystallographic directions. The measured hyperfine splittings reflect the marked dependence of the ground state of the Ho^{3+} ion on the direction of magnetisation. Results are interpreted in terms of a single-ion effective-field model with no free parameters. Satisfactory agreement between theory and experiment is obtained only when terms of second order in the free-ion hyperfine interaction are included in the calculations. Among the second-order terms is a pseudo-octupole interaction which imparts a measurable asymmetry to the NMR spectra. (30 refs.)

68045 A deuterium NMR study of $D(UO_2XO_4)$, $4D_2O$; X=P, As. T.K.Halstead (Dept. of Chem., Univ. of York, York, England), N.Boden, L.D.Clark, C.G.Clarke.
J. Solid State Chem. (USA), vol.47, no.2, p.225-30 (April 1983).
Deuterium NMR spectra have been obtained by the solid echo technique for polycrystalline samples of DUO_2XO_4, $4D_2O$, with X=P (DUP) and As (DUAs). Transitions (II→I) were found, by DSC measurements, to occur at 260 and 290K for DUP and DUAs, respectively. In the high temperature tetragonal phase *I*, the NMR lineshapes are consistent with motionally averaged axially symmetric electric field gradient tensors, with values for $\langle e^2qQ/h\rangle_{av}$ of 39.2 ± 0.2 and 38.2 ± 0.2 kHz for DUP and DUAs, respectively. This requires fast chemical exchange of the deuterium atoms between all of the hydrogen-bond sites in a water layer, and participation of all of the deuterium atoms in the diffusion process. There are no discernible discontinuities in the spectra at the transition temperature suggesting that there is little change in the local structure of the water layers at the transition. The spectra disappeared at about 10K below T_c and for DUP a distorted broader spectrum became discernible below about 200K. (13 refs.)

68046 A study of polyhedral octa(organosilasesquioxanes) by high-resolution NMR at the ^{13}C and ^{29}Si nuclei in the solid state. L.E.Gorsh, A.A.Shubin, V.M.Nekipelov, A.N.Kanev (Inst. of Inorganic Chem., Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.345-8 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.26-9 (May-June 1982). [received: Feb. 1983]
Polyhedral octa(organosilasesquioxanes) $(RSiO_{1.5})_8$, where r-CH_3, C_2H_5, or C_2H_3, have been studied by high-resolution NMR at the ^{13}C and ^{29}Si nuclei in the solid state. A correspondence has been established between the nonequivalence of the silicon atoms and the distortion of the silicon-oxygen framework of the molecule. An explanation has been given for the nature of the splitting of the signals of the β-carbon atoms in the ^{13}C NMR spectra in the ethyl and vinyl derivatives. (14 refs.)

68047 ^{13}C NMR analysis of propylene-butylene copolymers by a reaction probability model. H.N.Cheng (Hercules Inc., Res. Centre, Wilmington, DE, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.573-81 (April 1983).
^{13}C NMR spectra of propylene-1-butene copolymers have been studied at 90.55 MHz. At this high field many lines previously not resolvable were found to be sensitive to comonomer sequence distribution; these microstructures have been fully assigned. Each NMR spectrum was analysed by a reaction probability model. Information available includes polymer composition, comonomer sequence distribution, and Markovian reaction probabilities. The use of this model reduces errors in the determination of sequence distribution and furthermore enables the product r_1r_2 of the reactivity ratios to be determined for the copolymer/catalyst system.

68048 NMR studies of the structure of glass. P.J.Bray, W.J.Dell (Dept. of Phys., Brown Univ., Providence, RI, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.131-42 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Over the past 25 years, wide-line nuclear magnetic resonance (NMR) techniques have been used successfully to study the structure of glasses on an atomic scale. Analysis of the quadrupolar structure in NMR spectra of borate glasses has yielded quantitative determinations of the relative numbers of boron atoms in various oxygen environments. After a brief discussion of the relevant aspects of NMR theory, the authors present some of the most recent studies: B^{11} NMR in sodium borosilicate glasses of high soda content, B^{10} NMR in lithium borate glasses, and Be^9 NMR in sodium fluoride-beryllium fluoride glasses. (27 refs.)

68049 Wide-line NMR in polymers. P.Tekely (Polska Akad. Nauk, Zaklad Polimerow, Zabrze, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.27, no.4, p.137-42 (April 1982). In Polish. [received: March 1983]
Theoretical principles, methods of interpretation and uses of wide-line NMR spectroscopy for investigations of the phase structure as well as various types of molecular motions in polymers have been discussed. The fields of application of this method in the determination of the degree of crystallinity in polymers in the studies on oriented and cross-linked polymers and on polymer-low-molecular-weight substance systems have been indicated. (91 refs.)

68050 Incorporation scheme of H reducing defects in a-Si studied by NMR and ESR. T.Shimizu, K.Nakazawa, M.Kumeda, S.Ueda (Dept. of Electronics, Kanazawa Univ., Kanazawa, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.926-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
By comparing the results of NMR, ESR and photoconductivity measurements, it is found that dispersed H atoms bonded to Si mainly play a role in reducing the density of dangling bonds N_s. Gathered H and F atoms appear to decrease the mobility. It is also concluded that the decrease in N_s with an increase in substrate temperature T_s does not result from a direct thermal relaxation but from a different H incorporation scheme at a higher T_s. (8 refs.)

68051 ^{23}Na NMR of Na^- in a disordered material. P.P.Edwards, S.C.Guy, D.M.Holton (Chem. Lab., Univ. of Cambridge, Cambridge, England), W.McFarlane.
Philos. Mag. B (GB), vol.47, no.4, p.367-75 (April 1983).
A negative effective Hubbard correlation energy (negative *U*) in chalcogenide glasses leads to a preponderance of valence-alternation defect pairs, D^+ and D^-, in the energy gap of these disordered materials. The authors show that a dilute solution of sodium in a non-aqueous solvent can also have this property, yielding Na^+ and Na^- as the major diamagnetic ground states. The direct observation of Na^-, an anion of sodium, is accomplished by ^{23}Na NMR spectroscopy. Na^- exists in this system as a genuine 'gas-like' metal anion in which the two valence electrons reside in an unperturbed 3s orbital, and effectively shield the sodium 2p electrons from the influence of the host matrix. (33 refs.)

68052 Magic-angle rotation ^{11}B NMR studies of chemical structure for solid tetrahaloborates. R.K.Harris, A.Root (School of Chem. Sci., Univ. of East Anglia, Norwich, England), K.B.Dillon.
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.309-10 (1983).
It is shown that the technique of magic-angle rotation suffices to narrow ^{11}B NMR lines for solid tetrahaloborates so that peaks due to different ions can be resolved. The method is found to give detailed structural information for a sample containing a mixture of ions of the type $[BCl_nBr_{4-n}]^-$. (18 refs.)

68053 Amplification effects for nuclei in domain boundaries at low temperatures. V.P.Chekmarev (A.F. Ioffe Physicotech. Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1629-30 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2870-2 (Sept. 1982). [received: April 1983]
The author presents the results of analyzing the low-temperature-amplification coefficient properties for nuclei located in domain walls. He considers a 180° domain wall in the simplest case of a ferromagnet with single-axis anisotropy. In this case the NMR frequency for nuclei in the domain walls is $\omega_{n\theta}=\omega_{n0}-\Delta\omega\ \sin^2\theta$, where ω_{n0} is the NMR frequency in a domain, θ is the angle determining the position of an isochromat in the domain wall. (6 refs.)

68054 Resolution of transient NMR experiments in the rotating coordinate system in solids. A.E.Mefyod, E.B.Fel'dman (Inst. of Radio-Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1789-90 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3156-8 (Oct. 1982). [received: April 1983]
The authors consider a technique of direct observation of NMR in the effective field H_{eff} acting in the rotating coordinate system. In this technique the NMR signal is formed at the frequency $\Theta_0=\gamma H_{eff}\ll\omega_0$ and is recorded during the action of the RF field over one passage by measuring the longitudinal component $M_z(t)$ of the nuclear magnetization $M(z\|H_0)$. (6 refs.)

68055 Proton NMR investigations of the smectic-C phases of three alkyloxy-azoxybenzenes. S.Limmer, M.Findeisen (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.434-46 (April 1983).
Proton NMR investigations of the smectic-C phases of three 4,4′-bis-*n*-alkyloxy-azoxybenzenes (C_7, C_8, C_9) with temperature independent tilt angles are presented. The behaviour of well-aligned samples (strong magnetic field ≳1.5 T, slow cooling rate) under rotation in the field can be described by the models of Luz and Meiboom (1973), and Wise, Smith, and Doane (1973), (LM/WSD), resp. However, on polarization of the samples in presence of magnetic fields ≲0.75 T the molecular directors are not arranged preferentially parallel to the direction of the polarizing magnetic field but are rather inclined, i.e. the layers are stacked preferentially perpendicular to the original magnetic field direction (PSL model). It is shown that all the angular dependences of NMR second moments can be interpreted in terms of a superposition of the LM/WSD and PSL models, or, on the other hand, by assuming totally disordered fractions of the samples together with portions that fully obey the behaviour demanded by one of the above models (LM/WSD or PSL). The tilt angles derived from the comparison of experimental and theoretical angular dependences of the second moments for well-aligned samples are applied to the explanation of the experiments at lower polarizing fields successfully, too. 76.60C Chemical and Knight shifts

68056 Coordination compounds of $[Hg\{PPh_2[M(CO)_5]\}_2]$, (M=Cr, Mo, W). P.Peringer (Inst. fur Anorg und Analyt. Chemie, Univ. Innsbruck, Innsbruck, Austria).
Polyhedron (GB), vol.1, no.11-12, p.819-20 (1982).
Coordination of various neutral N and O ligands causes drastic changes in $^1J(^{31}P\text{-}^{199}Hg)$ (increase up to the threehold) and $\delta(^{31}P)$ (shifts up to 30 ppm to low frequencies), which are due to the presence of the $M(CO)_5$ groups. The complexes with DMSO, phen and bipy were isolated in the solid state. No coordination of $[Hg\{PCy_2[Cr(CO)_4]\}_2]$ with the above ligands is observed. (5 refs.)

68057 Measurement of ^1H Knight shift and magnetic susceptibility in compressed powder samples of $TaH_{0.61}$. W.Baden, A.Weiss (Inst. fur Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.459-62 (April 1983).
Measurements of the Knight shift K_H and the magnetic susceptibility of $TaH_{0.61}$ on thin foils, prepared from $TaH_{0.61}$ powder at high pressure, are reported. It is shown that the method leads to useful results and is applicable to brittle materials for which compact samples are not available. Both, K_H and χ_v, are given for the hydrides TaH_x in the range $0\leq x\leq0.74$. (12 refs.)

76.60E Relaxation effects

68058 Intervalence excitations of a mixed-valence salt: NMR and optical absorption in molten $InCl_2$. W.W.Warren,Jr. (Bell Labs. Inc., Murray Hill, NJ, USA), G.Schonherr, F.Hensel.
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.505-8 (15 April 1983).
The authors report ^{115}In nuclear relaxation rates for molten $InCl_2$ and visible-near-infrared absorption spectra for molten $InCl_2$ and In_2Cl_3. A weak band at 2.1 eV in $InCl_2$ is attributed to the intervalence transfer excitation $In^{+} \to In^{3+}$. The intensity of the intervalence band is correlated with the lifetime of the excited, magnetic ion In^{2+} measured by NMR. (6 refs.)

68059 Proton NMR and dielectric relaxations in some phenolic Mannich bases. M.Jeyaraj, J.Sobhanadri (Dept. of Phys., Indian Inst. of Technol., Madras, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.841-3 (Oct. 1982). [received: April 1983]
Spin-lattice relaxation times (T_1) are determined for different protons in 3 phenolic Mannich bases in pure liquid state. Standard 180°-t-90° pulse sequences are employed. NMR rotational correlation times (τ_c) evaluated for different protons are compared with the dielectric relaxation times of the respective molecules. Ring protons seem to significantly contribute to the observed relaxation in these molecules. (12 refs.)

68060 Deuterium relaxation of a partially oriented methyl group. III. Order director fluctuations and solute reorientation in a nematic solution of acetonitrile-d_3. D.Jaffe, R.L.Vold, R.R.Vold (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4852-7 (15 April 1983).
For pt.II see J. Mag. Reson., vol.46, no.3, p.496 (1982). Deuteron spin-lattice relaxation rates (R_{1Z}) and relaxation rates of quadrupolar order (R_{1Q}) have been determined between 13 and 47°C at 38.4 MHz, for a 10.5 mol% of acetonitrile-d_3 in Merck Licristal phase 5, and selective and nonselective measurements of spin-lattice relaxation have been carried out at 4.6 and 9.2 MHz over the same temperature range. The data can be satisfactorily explained by a combination of fast, anisotropic reorientation (corrected for effects of static ordering) and hydrodynamic fluctuations in the orientation of the nematic director. Large values of the rotational anisotropy were derived from the spin-lattice relaxation data, and confirmed by 38.4 MHz measurements of the temperature dependence of the relaxation rate $R_2(ZQ)$ of a zero quantum coherence. The results obtained here are discussed in terms of recent related ^{13}C relaxation studies of acetonitrile in nematic solution. (21 refs.)

68061 NMR study of spectral densities over a large frequency range for intermolecular relaxation in liquids: pair correlation effects. J.P.Albrand, M.C.Taieb (Dept. de Recherche Fondamentale, CENG, Grenoble, France), P.H.Fries, E.Belorizky.
J. Chem. Phys. (USA), vol.78, no.9, p.5809-15 (1 May 1983).
In order to study the dynamic effects of pair correlation functions on intermolecular translational relaxation in liquids, the authors have measured the relaxation times T_1 of the protons in neopentane in the presence of di-t-butylnitroxide free radicals with concentrations varying up to 6.5×10^{20} paramagnetic centers$\times cm^{-3}$. Under these conditions, the dominant relaxation mechanism for the resonating protons arises from their interactions with the electronic spins of the free radicals. NMR experiments were performed between 2.2 and 250 MHz and these allowed the authors to obtain information about the behavior of the relevant spectral densities over a very wide range of frequencies $0 < \omega_s \tau \lesssim 50$, where ω_s is the electronic resonance frequency of the radical and where τ is the translational correlation time. It is shown that a model in which the effects of eccentricity of the spins are included and where the translational motion of the molecules is described by a Smoluchowski diffusion equation, (i.e., taking into account their impenetrability and the nonuniform relative distribution of the molecules calculated in the approximation of Lee and Levesque, 1973) gives good agreement with experiment. It is also emphasized that introducing pair correlation effects provides a model without any adjustable parameters which is an advantage compared to a theory of random jumps. (28 refs.)

68062 A ^{1}H NMR study of the effects of Ni additions on the behavior of hydrogen in β-vanadium hydride. S.Hayashi, K.Hayamizu, O.Yamamoto (Nat. Chem. Lab. for Industry, Ibaraki, Japan).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.601-6 (1983).
The behavior of hydrogen in the hydrides of vanadium metal containing small amounts of nickel was studied by ^{1}H NMR spectroscopy. FT spectra and spin-spin and spin-lattice relaxation times for $VH_{0.77}$, $V_{0.95}Ni_{0.05}H_{0.73}$ and $V_{0.90}Ni_{0.10}H_{0.65}$ were measured at temperatures between 77 and 400K. On the addition of nickel the number of hydrogem atoms on O_{z2} sites decreases and the superstructure of hydrogen is altered. Different effects of nickel on hydrogen diffusion are observed above and below about 200K, and therefore the mechanism of hydrogen diffusion is assumed to change at this temperature. (16 refs.)

68063 Molecular motion in solid tetraethylammonium halides. B.Szafranska, Z.Pajak (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).
J. Mol. Struct. (Netherlands), vol.99, no.1-2, p.147-57 (May 1983).
The second moments of the proton NMR lines as well as spin-lattice relaxation times, T_1, for polycrystalline tetraethylammonium halides $[(C_2H_5)_4]NX$, $X=F^-$, Cl^-, Br^- or I^- were measured from 77 to 473K. A stepwise decrease in the temperature dependences of the second moments and minimum values of the relaxation times have been observed for all the compounds studied. The experimental results are discussed in terms of a theoretical model with consecutive onset of reorientations of the methyl and ethyl groups and cationic tumbling. The appropriate activation parameters have been determined. Reorientations of the ethyl groups around N-C bonds are found to be highly correlated. The motional behaviour appears significantly affected by phase transitions and anion-cation interaction. The occurrence of the solid-solid phase transitions was verified by DTA. (19 refs.)

68064 Nuclear spin-lattice relaxation in a lithium-silicate glass. P.Heitjans, B.Bader, K.Dorr, H.J.Stockmann, G.Kiese, H.Ackermann, P.Freilander, W.Muller-Warmuth (Fachbereich Phys., Univ. Marburg, Marburg, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.143-7 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The spin-lattice relaxation rate T_1^{-1} of ^{8}Li in the silicate glass $(SiO_2)_{0.67}(Li_2O)_{0.33}$ has been measured over the temperature range $6K \leq T \leq 340K$ and the magnetic field range $14\ mT \leq B \leq 830\ mT$ using the asymmetric β-decay radiation of polarized ^{8}Li nuclei. The polarization showed non-exponential decay. T_1^{-1} was found to depend approximately linearly on B^{-1} and T for $T < 170K$. The results can be explained within the framework of a phenomenological model. (14 refs.)

68065 Nuclear magnetic resonance of ^{169}Tm (enhanced) and ^{31}P in $TmPO_4$. B.Bleaney, J.H.T.Pasman, M.R.Wells (Clarendon Lab., Oxford Univ., Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.75-90 (8 May 1983).
The enhanced nuclear magnetic resonance spectrum of ^{169}Tm ($I={}^1/_2$) in the tetragonal compound $TmPO_4$ has been measured from 1.6K to 30K. It is highly anisotropic, with $\gamma/2\pi = 11.34$ and 276 MHz T^{-1} parallel and perpendicular to the c-axis respectively, at the lowest temperatures. The corresponding values of the Val Vleck electronic susceptibility per ion are 0.0231 and 0.805 $\mu_B\ T^{-1}$. Above 4K the values of $\gamma/2\pi$ become temperature dependent as excited levels become populated, and the results are discussed in the light of a crystal field calculation of the energy levels and wave functions. The NMR spectrum of ^{31}P ($I={}^1/_2$) is shown to exhibit an anisotropic paramagnetic shift, mainly dipolar in origin, exactly proportional to the electronic susceptibility of the Tm^{3+} ions, and this is used to extrapolate the measurement of γ for ^{169}Tm up to 64K in the perpendicular direction. A simple calculation of the direct process for spin-lattice relaxation shows that this is orders of magnitude too slow to account for the observed relaxation rates, which must be ascribed to the presence of paramagnetic impurities. (22 refs.)

68066 The spin-lattice relaxation of the moving two-spin group in multipulse spin locking. Yu.N.Moskvich, A.M.Polyakov, S.P.Prozorov, V.E.Zobov, A.V.Ponomarenko (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K35-8 (1 March 1983).
It is shown that the motion induced spin lattice relaxation time T_{2e} has different magnetic field dependences if the measurements are performed for slow or rapid motions. However the authors have found that this feature is not always observed. They investigate the effect using measurements on stilbite $CaAl_2Si_7O_{18}.7H_2O$. (7 refs.)

68067 Frequency dependence of spin-lattice relaxation of ^{1}H and ^{7}Li nuclei in concentrated nickel solutions. K.Kabal, V.L.Chizhik.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.20-4 (Feb. 1983). In Russian.
Spin-lattice relaxation rates of protons and lithium nuclei in concentrated nickel solutions have been measured. These quantities are shown to depend on the resonance frequency level. The nature of the effect is discussed. (19 refs.)

76.60G Quadrupole resonance

68068 On the order-disorder phase transition of anilinium halides. VI. Phase transition in $4\text{-}RC_6H_4NH_3{}^+X^-$, and $C_6N_5HR'H_2{}^+X^-$, $X=Br,I$. A ^{79,81}Br and ^{127}I NQR study. V.G.Krishnan, A.Weiss (Inst. fur Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.254-63 (March 1983).
By ^{79,81}Br and ^{127}I NQR spectroscopy $4\text{-}FC_6H_4NH_3{}^+X^-$, $4\text{-}FC_6H_4ND_3{}^+X^-$, $4\text{-}(H_5C_2)C_6H_4NH_3{}^+X^-$, $C_6H_5N(CH_3)H_2{}^+X^-$, $C_6H_5N(C_2H_5)H_2{}^+X^-$, $X=Br$ and I, respectively, were studied in the temperature range $77 \leq T/K \lesssim 400$. All the para substituted compounds experience a phase transition of higher order (presumably second order), the nature of which is most likely a ferroelastic one as it is in $C_6HY_5NH_3{}^+X^-$, $X=Br$, I. The isotope exchange $H \to D$ lowers the transition temperatures of the parafluoroanilinium halides, the resonance frequencies, the nuclear quadrupole coupling constant of the iodide, but raises the asymmetry parameter of the latter compound. Substitution of a hydrogen atom at the $-NH_2$ group in aniline inhibits the phase transition in $C_6H_5N(CH_3)H_2{}^+I^-$ and $C_6H_5N(C_2H_5)H_2{}^+X^-$, $X=Br$, I. However, a phase transition of first order was observed for $C_6H_5N(CH_3)H_2{}^+Br^-$ at 141.5K. (24 refs.)

68069 Temperature dependence of ^{35}Cl NQR in 2,6-dichloropyridine. S.P.Basavaraju, N.Devaraj (Dept. of Phys., Bangalore Univ., Bangalore, India), A.Indumathy, K.R.Sridharan, J.Ramakrishna.
J. Solid State Chem. (USA), vol.47, no.2, p.236-8 (April 1983).
Chlorine NQR in 2,6-dichloropyridine has been investigated in the temperature range 77K to room temperature and a single resonance line has been observed throughout. Using this data, torsional frequencies of the molecule have been evaluated on the basis of both the Bayer theory (1951) and the modified Bayer theory incorporating the Tatsuzaki correction (1957). (8 refs.)

68070 Temperature dependence of the frequency of pseudoquadrupole resonance of ^{141}Pr nuclei. I.G.Bol'shakov, M.A.Teplov (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1601-2 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2826-9 (Sept. 1982). [received: April 1983]
The authors show that simple measurements of the temperature dependence of the nuclear resonance frequencies $\nu_{1/2,3/2}$ and $\nu_{3/2,5/2}$ allow one to determine the energy gap Δ separating the ground electronic singlet from the excited states of the Pr^{3+} ion in the crystal electric field. Experiments were carried out with polycrystalline specimens of dielectric praseodymium compounds $Pr_2(SO_4)_3.8H_2O$, $Pr(NO_3)_3.6H_2O$, PrF_3 and $Pr(CH_3COO)_3.2H_2O$. To evaluate the importance of the various contributions to the parameters of the spin Hamiltonian, the authors have made NMR measurements of ^{141}Pr in these substances. (6 refs.)

76.60L Spin echoes

68071 ^{1}H NMR study of the phase separation and the behavior of hydrogen in $Ti_{1-y}V_yH_x$. S.Hayashi, K.Hayamizu, O.Yamamoto (Nat. Chem. Lab. for Industry, Ibaraki, Japan).
J. Chem. Phys. (USA), vol.78, no.8, p.5096-102 (15 April 1983).
The behavior of hydrogen in the Ti-V hydrides was studied by ^{1}H NMR spectroscopy.FT spectra and spin-lattice relaxation times of $Ti_{0.60}V_{0.40}H_{0.90}$, $Ti_{0.40}V_{0.60}H_{0.79}$, and $Ti_{0.20}V_{0.80}H_{0.77}$ were measured in a temperature range between 125 and 425K. A phase separation occurs in the Ti-V hydrides by hydriding, and the β-Ti-V-H and the γ-Ti-H phases are dominant. The former phase increases with temperature, accompanied by the decrease in the latter. The composition in the γ-Ti-H phase is almost independent of tempe-

rature, while it changes with temperature in the β-Ti-V-H phase. In the β-Ti-V-H phase, hydrogen-ordered structures are assumed to be formed, and the hydrogen diffuses faster than in β-VH$_x$ and γ-TiH$_x$. (18 refs.)

68072 Multiphoton NMR spectroscopy on a spin system with $I=1/2$. Y.Zur, M.H.Levitt, S.Vega (Dept. of Isotope Res., Wiezmann Inst. of Sci., Rehovot, Israel).
J. Chem. Phys. (USA), vol.78, no.9, p.5293-310 (1 May 1983).
Multiple quantum effects in double frequency (df) pulsed NMR experiments on multilevel spin systems are studied. In these experiments, the spin systems are irradiated by two RF fields, applied simultaneously. A general theoretical description of these experiments is presented using the theory of Shirley (1965) for time dependent Hamiltonians. Multiphoton resonance conditions are given and time independent fictitious spin-1/2 Hamiltonians are derived using his perturbation theory treatment. With these Hamiltonians, the evolution of the spin systems during df irradiation is approximate. The example of df NMR experiments on an $I=1/2$ spin system is discussed. High order perturbation theory is developed to describe the time evolution of this spin system at a three photon resonance. Accurate computer calculations are performed to examine this time evolution. Df NMR experiments are performed on the single ^{31}P($I=1/2$) transition of phosphoric acid to check the theoretical results. The three photon resonance condition for these measurements is studied as a function of the RF radiation intensities and of the resonance offsets of the two frequency components of df irradiation fields. Special NMR pulse cycles are used to study the dependence of the phase of the coherence created by df pulses on the initial RF phases of the two frequency components. Spin-echo type of experiments are developed to detect the spiral motion of the magnetization vector of the $I=1/2$ spin system at the three-photon resonance. (45 refs.)

68073 NMR of ^{141}Pr in ferromagnetic GdAl$_2$ and NdAl$_2$. J.W.Ross, O.Prakash, M.A.H.McCausland (Schuster Lab., Univ. of Manchester, Manchester, England).
J. Phys. F (GB), vol.13, no.5, p.L95-8 (May 1983).
The hyperfine interaction of praseodymium, as a dilute substitutional impurity in GdAl$_2$ and in NdAl$_2$, has been studied by spin-echo NMR at 1.4K. The electric quadrupole splitting is unresolved in the frequency domain, but has been measured by observing the oscillatory decay of the echo amplitude. From the magnetic dipole splitting the authors deduce, after allowance for extra-ionic contributions, that the Pr^{3+} moments in GdAl$_2$ and NdAl$_2$ are $(2.85\pm0.03)\mu_B$ and $(2.96\pm0.03)\mu_B$, respectively. Theoretical analysis of these results yields effective exchange constants for Pr^{3+}:GdAl$_2$ and for Pr^{3+}:NdAl$_2$ which differ significantly from the values to be expected on the conventional model of indirect lanthanide-lanthanide exchange. (13 refs.)

68074 Pressure and temperature dependence of the hyperfine fields of YFe$_2$, YFe$_3$ and YIG. P.C.Riedi, G.D.Webber (Dept. of Phys., Univ. of St. Andrews, St. Andrews, Scotland).
J. Phys. F (GB), vol.13, no.5, p.1057-69 (May 1983).
The hyperfine field (H_T) of ^{89}Y in YFe$_2$ and YFe$_3$ and of ^{57}Fe in single-crystal and sintered polycrystalline YIG has been measured as a function of pressure to 15 bar at room temperature and for YIG also to 7 kbar at 77K. The value of $(\partial \ln H_T/\partial P)_T$ for YIG at 77K is zero to experimental accuracy but is positive at room temperature due to the pressure dependence of the Neel temperature. Little difference was found between the values for single-crystal and sintered YIG. The values of $(\partial \ln H_T/\partial P)_T$ for ^{89}Y in YFe$_2$ and YFe$_3$ were found to be in general agreement with those to be expected if the Y hyperfine field (HFF) is produced by the polarisation of s like conduction electrons but a small contribution from the d band is probably required to explain the results in detail. The spin-wave stiffness coefficient of YIG was found to be (0.568 ± 0.011) eV Å^2 from an analysis of the temperature dependence of the HFF below 20K. This value is in good agreement with those found less directly by earlier HFF and magnetisation measurements and confirms that there is a large discrepancy with the value found by neutron scattering experiments. The reduced HFF at the two Y sites in YFe$_3$ was found to have the same temperature dependence below 35K ($T^{3/2}$ law) and in this region decreases far more slowly than was predicted from analysis of Mossbauer measurements made up to room temperature. Above 100K the difference in the reduced HFF at the two Y sites in YFe$_3$ appeared to be proportional to $T^{3/2}$ which, in view of the low-temperature result, must arise from a partial cancellation of higher order spin-wave terms. (34 refs.)

68075 Local binding configuration of phosphorus in doped and compensated amorphous hydrogenated silicon. J.A.Reimer (IBM Thomas J.Watson Res. Center, Yorktown Heights, NY, USA), T.M.Duncan.
Phys. Rev. B (USA), vol.27, no.8, p.4895-901 (15 April 1983).
From an analysis of ^{31}P nuclear-magnetic-resonance spectra, the chemical nature and local bonding of phosphorus in samples of amorphous hydrogenated silicon (*a*-Si:H) have been determined. Overlapping spectra of threefold- and fourfold-coordinated phosphorus may be separated on the basis of dipolar couplings are identified on the basis of chemical shifts. At low concentrations of phosphorus, the ratio of threefold- to fourfold-coordinated phosphorus is approximately 4 to 1. The magnitudes of the ^{31}P-^{1}H and ^{1}H-^{1}H dipolar couplings indicate that fourfold-coordinated phosphorus is located at internal hydrogenated surfaces. Finally, the increase of fourfold-coordinated sites in compensated *a*-Si:H suggests the formation of boron-phosphorus complexes. (26 refs.)

68076 Electronic configuration of copper ions in Cd$_{1-x}$Cu$_x$Cr$_2$Se$_4$ ($x\leq0.07$). N.M.Kovtun, V.K.Prokopenko, A.A.Shemyakov, T.G.Aminov, G.G.Shabunina (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1593-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2814-15 (Sept. 1982). [received: April 1983]
Elucidation of the nature of the electromagnetic properties of chalcogenide spinel (1-x)CdCr$_2$Se$_4$-xCuCr$_2$Se$_4$ solid solutions has been complicated by the absence of agreement on the valence state of the copper ions. In order to resolve this problem the authors investigated the NMR spectra of Cd$_{1-x}$Cu$_x$Cr$_2$Se$_4$ at values for which the system remains a single phase, $x\leq0.07$. The NMR method allowed them to obtain more complete data on the valence state of the ions, since the local fields at the nuclei of 3d-metal ions are determined by their electronic configurations. The NMR spectra of Cr^{53}, Cu^{63}, Cu^{65}, Se^{77}, Cd^{111}, and Cd^{113} were obtained at 4.2K by the spin-echo method. (6 refs.)

68077 Quantum statistical theory of a one-pulse echo. L.L.Buishvili, E.B.Volzhan, K.O.Khutsishvili (State Univ., Tbilisi, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1808-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3184-6 (Oct. 1982). [received: April 1983]
In the spin echo method, the nuclear spin system with an inhomogeneous broadening of the magnetic resonance line is excited by one or more RF pulses and echo signals representing the response of the nuclear system to the applied pulses are observed. The authors propose a quantum statistical theory of the one-pulse echo in spin systems with the Suhl-Nakamura interaction. For simplicity, they consider the situation when no dynamic shift of the frequency occurs. (6 refs.)

76.70 MAGNETIC DOUBLE RESONANCES AND CROSS EFFECTS

76.70D Electron-nuclear double resonance (ENDOR)

68078 Optical alignment of the electron-nuclear spin system using pumping radiation with modulated polarization. V.L.Vekua, R.I.Dzhioev, I.A.Merkulov, M.N.Tkachuk, V.G.Fleisher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.505-7 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.83-5 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
It is shown experimentally that an effective field due to the nuclei appears when the polarization of the photoexcited electrons is modulated at a frequency much greater than the NMR frequency in an alternating external magnetic field that is synchronized with the modulation of the electron polarization. (4 refs.)

68079 Effect of weak nuclear-field anisotropy on optical alignment in semiconductors. E.S.Artemova, I.A.Merkulov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.511-13 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.89-91 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
An analysis is given of optical alignment in semiconductors in the case of weak anisotropy of the nuclear field, due to a local departure from the symmetry of the crystal lattice. An analytic expression is obtained for the magnetic depolarization curve for recombinational emission (the Hanle curve). (4 refs.)

68080 Optically detected electron-nuclear double resonance in hydrogenated amorphous silicon. Y.Sano, K.Morigaki, I.Hirabayashi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.923-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Optically detected electron-nuclear double resonance (ODENDOR) measurements were carried out at 2K and 9.6 GHz, monitoring total emitted light in hydrogenated amorphous silicon. ODENDOR signals were observed in the RF frequency range of 0.6 MHz-15 MHz for the A centre (trapped hole centre) and dangling bond centre. The spatial distribution of weak hyperfine interaction with ^{29}Si nuclear spins may be responsible for broad ONENDOR lines. (7 refs.)

68081 ENDOR investigation of tellurium donors in silicon. J.R.Niklas, J.M.Spaeth (Univ.-GH-Paderborn, Paderborn, Germany).
Solid State Commun. (USA), vol.46, no.2, p.121-6 (April 1983).
Paramagnetic Te$^+$ donors in silicon form deep level impurities. They were investigated with electron nuclear double resonance (ENDOR). The superhyperfine interaction with 12 shells of ^{29}Si nuclei could be determined and it was confirmed that $S=1/2$. 10% of the unpaired spin density are on the central nucleus, 40% in the 4 nearest Si neighbours along ⟨111⟩, altogether 75% are within the 12 shells (108 nuclei). The SHF structure is very similar to that of S$^+$ in Si investigated earlier by Ludwig (1965). From the ENDOR analysis alone it cannot be decided whether Se$^+$ is interstitial or on a lattice site. The distribution of unpaired spin density over the neighbour shells is discussed for both sites. It seems, however, easier to explain it assuming the interstitial site. (19 refs.)

68082 ENDOR investigation of Ni^{3+} in GaP. Y.Ueda, J.R.Niklas, J.M.Spaeth (Univ.-GH Paderborn, Paderborn, Germany), U.Kaufmann, J.Schneider.
Solid State Commun. (USA), vol.46, no.2, p.127-31 (April 1983).
With ENDOR measurements the ligand hyperfine and quadrupole interactions of Ni^{3+} in GaP with 3 shells of P neighbours and 3 shells of Ga neighbours could be resolved. It was established that the effective spin is 3/2, thus the defect is in the 3d^7 state, which confirms the earlier assignment of the centre as an Ni^{3+} from ESR measurements. From the quadrupole interaction of the nearest Ga neighbours it can be concluded that Ni^{3+} is substitutional for Ga. From ENDOR-induced ESR experiments an upper limit for the u-parameter of the B.S^3 term in the spin Hamiltonian was determined. The unpaired spin density distribution shows a pronounced tetrahedral symmetry along the [111]-directions. (17 refs.)

Electron paramagnetic resonance and ENDOR studies of Cr^{3+}-Al^{3+} pairs in forsterite .... See Entry 68003

76.70F Double nuclear magnetic resonance (DNMR)

68083 Transverse nuclear-spin relaxation in the presence of anticrossing of spin levels. E.S.Artemova, I.A.Merkulov, V.G.Fleisher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.508-10 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.86-8 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
It is shown that for nuclei with anticrossing spin levels, the relaxation time of the spin component parallel to the quadrupole interaction axis is comparable with T$_2$ only in a small range of magnetic fields. This conclusion is confirmed experimentally in zero magnetic fields. (2 refs.)

68084 High-resolution solid-state nuclear magnetic resonance and X-ray structure study of choline chloride, bromide, and iodide. D.Wemmer (Dept. of Chem., Univ. of California, Berkeley, CA, USA), V.Petrouleas, N.Panaglotopoulos, S.E.Filippakis, R.M.Lemmon.
J. Phys. Chem. (USA), vol.87, no.6, p.999-1003 (17 March 1983).
^{13}C and ^{2}H high-resolution solid-state NMR studies of choline chloride and bromide in their radiation-sensitive α phases indicate the onset of reorientational motions at temperatures preceding the transition to their radiation-stable (higher-temperature) β phases. These motions are effectively isotropic both below and above the α-to-β phase transitions. The early onset of the rotational motion and the accompanying drop in the radiation sensitivity strongly suggest that the extreme difference in radiation sensitivity between the α and β phases is principally due to processes affected by the rotational motions and not to crystallographic differences. Choline iodide, which is radiation normal at all temperatures so far studied, shows motions of the two methylene carbons even at room temperature. An X-ray study of the latter compound at ambient temperature indicates $P_{2(1)}/m$ as the possible space

group with appreciable disordering between the symmetric positions related by the reflection plane defined by the O, N, and one of the methyl carbons. (14 refs.)

76.70H Optical double magnetic resonance (ODMR)

68085 Electron-hole recombination in As_2Se_3. B.C.Cavenett, S.P.Depinna, W.E.Lamb (Phys. Dept., Univ. of Hull, Hull, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.974-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors ODMR study shows the presence of two separate mechanisms, triplet and pair recombination, associated with exciton and distant-pair luminescence respectively. The resonances are qualitatively similar to previously reported ODMR signals in a-P and a-As_2S_3, and give the first magnetic resonance comparison of intrinsic defects in a chalcogenide crystal and the related glass. The authors also report the first observation of a strong luminescence peak shift with excitation energy in the glass, in fact, both crystal and glass PL spectra are identical for $E_{ex}>2$ eV. (14 refs.)

68086 Investigation of recombination processes in KCl:Tl crystals by optical detection of EPR. N.G.Romanov, V.A.Vetrov, P.G.Baranov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1706-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3014-19 (Oct. 1982). [received: April 1983]
The method of optical detection of EPR in the range 70-80 GHz was used to study tunneling recombination of electron and hole centers in KCl:Tl crystals. The EPR spectra recorded by monitoring the intensity of tunneling recombination afterglow of KCl:Tl crystals irradiated at 300K displayed EPR signals from Tl^{2+} ions in a regular environment, as well as signals from *F* centers. For the transitions between the various magnetic sublevels of Tl^{2+}, EPR signals of different signs were observed. Theoretical calculations of the magnetic quenching of the afterglow and the EPR signals were carried out. In addition to the Tl^{2+}-F recombination, a recombination of Tl^{2+} with electronic centers of a different kind, apparently $A_F(Tl)$, was shown to occur. (14 refs.)

76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

68087 A program to analyze series of Mossbauer spectra. E.Verbiest (Inst. voor Kern- en Stralingsfysica, Leuven, Belgium).
Comput. Phys. Commun. (Netherlands), vol.29, no.2, p.131-54 (April 1983).
The author analyzes a series of Mossbauer spectra by fitting them into a function, describing the physical relations between the Lorentzians and depending on parameters of which some are freely adaptable within given limits, some adaptable within limits but required to be identical for all spectra, and some constant. (1 ref.)

68088 High-resolution TDPAC experiments with fast BaF_2 scintillators. A.Baudry, P.Boyer, P.Vulliet (DRF/Lab. Interactions Hyperfines, CENG, Grenoble, France).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.263-9 (Feb. 1983).
TDPAC experiments on ^{181}Ta in various inorganic materials have been performed by using BaF_2 crystals as fast γ-ray scintillators. The use of such scintillators allows reaching a time resolution as low as 600 ps with both high detection efficiency and good energy resolution. (14 refs.)

68089 Internal magnetic hyperfine fields at Hf nuclei in iron, cobalt and nickel hosts. N.Aggarwal, B.Singh, A.K.Bhati, R.Bala, S.C.Bedi, H.S.Hans (Dept. of Phys., Panjab Univ., Chandigarh, India).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.271-4 (Feb. 1983).
Integral perturbed angular correlation technique has been used to measure the internal hyperfine magnetic fields at Hf nuclei in Fe, Co and Ni matrices. These represent a consistent set of measurements with diffused sources. The $^9/_2{}^+$ (208 keV) $^9/_2{}^-$ (113 keV) $^7/_2{}^-$ cascade in the decay of $^{177}Lu\rightarrow{}^{177}Hf$ was used for measurements. The measurements are compared with previous results and discussed in terms of methods of source preparation. (16 refs.)

68090 Disparity between the transient hyperfine fields for Pt and Os in Fe; an electron vacancy sharing interpretation. A.E.Stuchbery, C.G.Ryan, H.H.Bolotin (Univ. of Melbourne, Parkville, Victoria, Australia).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.275-95 (Feb. 1983).
Precessions of the $2_1{}^+$ states in ^{198}Pt and ^{192}Os have been measured in the enhanced transient hyperfine magnetic field acting on these nuclei as they recoiled through thin polarized cobalt foils. Two separate targets consisting of contiguous layers of ^{198}Pt and ^{192}Os electrodeposited on ~1 μm and ~4 μm Co foils were employed. The levels of interest were Coulomb excited by 80 MeV ^{32}S and 220 MeV ^{58}Ni beams and the precessions of the $2_1{}^+\rightarrow 0_1{}^+$ γ-ray angular distributions in both nuclides were measured simultaneously. The results of these studies are compared with recently reported similar studies in which ions of ^{188}Os and ^{194}Pt recoiled through thin polarized Fe foils. It is concluded that (i) the transient field acting on Pt in Fe is singularly anomalous, and (ii) the recent contention that the g-factors of the $2_1{}^+$ states in the even Pt isotopes may be substantially lower than had been reported in the literature cannot be sustained. This transient field discontinuity is examined in terms of possible molecular orbital electron vacancy sharing between Pt and Fe. (32 refs.)

68091 Temperature dependence of the hyperfine quadrupolar interaction in K_2ZrF_6. J.A.Martinez, A.M.Rodriguez, M.C.Caracoche, R.C.Mercader, A.R.Lopez Garcia, P.C.Rivas (Dept. de Fisica, Univ. Nacional de La Plata, La Plata, Argentina).
Hyperfine Interactions (Netherlands), vol.13, no.4, p.307-13 (Feb. 1983).
The thermal dependence of the hyperfine quadrupole interaction of $Tu^{181}Ta$ at Zr sites in K_2ZnF_6 has been studied by TDPAC between RT and 511°C. Four phases of ever increasing symmetry have been found in the range RT-437°C. The possible existence of a healing mechanism with an activation energy of 0.187±0.040 eV is discussed for the lattice recovery in the range 270°C-335°C. The results at temperatures above 437°C can be understood assuming a thermal decomposition of the compound. (12 refs.)

68092 Analysis of the Mossbauer-effect probability and the Mossbauer-line symmetry for SnO_2. V.A.Varnek, A.P.Chernyshev (Inst. of Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.5, p.700-3 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.835-7 (May 1982). [received: Feb. 1983]
The Mossbauer effect probabilities for SnO_2 were refined using the black absorber method. The mean-square displacements of the tin atom and the Debye temperatures for a broad temperature range were obtained. (14 refs.)

68093 Nuclear-gamma-resonance-spectral analysis of structural transformations of iron-containing chrysotile asbestos and its composition with polyorganosiloxane during heat treatment. S.P.Ekimov, L.M.Krizhanskii, V.A.Krotikov, L.V.Filina, N.P.Kharitonov (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.5, p.724-9 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.864-9 (May 1982). [received: Feb. 1983]
Iron-containing chrysotile asbestos and its composition with a polyorganosiloxane (POS) calcined at various temperatures up to 1300°C were subjected to a study by means of nuclear gamma resonance spectroscopy. The Fe_3O_4 present in the starting asbestos sample undergoes successive conversion to α-Fe_2O_3, the $(Fe_{0.75}Al_{0.25})_2O_3$ mixed oxide, and a spinellide on the basis of $MgFe_2O_4$. Reduction of Fe^{3+}, which is accompanied by replacement of Mg^{2+} by Fe^{2+} in the silicate phases, namely forsterite and enstatite, begins at 1110-1150°C. A mixed oxide is not formed in the presence of added POS, the fraction of the olivine component decreases as compared with the pyroxene component, and the transition of iron from the $(\alpha\text{-}Fe_2O_3)_s$ superparamagnetic phase to α-Fe_2O_3, olivine, and pyroxene takes place to a greater extent. Microparticles of $(\alpha\text{-}Fe_2O_3)_s$ are formed at 700°C primarily from the iron in the asbestos lattice both in the presence and absence of added POS. (14 refs.)

68094 Analysis of asymmetry of the Mossbauer line of tin(II) sulfide and selenide. V.A.Varnek, T.I.Guzhavina (Inst. of Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.5, p.735-7 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.875-6 (May 1982). [received: Feb. 1983]
The Mossbauer spectra of the layered semiconductor compounds SnS and SnSe exhibit asymmetry of components of the quadrupole doublet, which is explained by manifestation of the Gol'danskii-Karyagin effect. The results of the spectral resolution enable the authors to conclude that the observed asymmetry of the Mossbauer spectra of SnS and SnSe is related to the difference of the widths of the components of the quadrupole doublet. Such difference of the widths includes, for example, the correlated variation of the chemical shifts and quadrupole splittings due to the weak nonequivalence of the tin atoms in the crystal-lattice points. The possible reason for such nonequivalence is some difference in the composition in various areas of the crystallites from a rigorously stoichiometric composition. (8 refs.)

68095 Mossbauer spectroscopy on high-spin d^5 iron complexes: crystal field calculations. K.Spartalian, C.J.Carrano (Univ. of Vermont, Burlington, VT, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4811-16 (15 April 1983).
Mossbauer spectra of high-spin ferric Fe(EHPG) compounds in frozen solution have been recorded at 4.2K in a small applied field. The spectra have been analyzed in terms of a spin Hamiltonian with $S=5/2$ used as an intermediate step for generating a crystal field model that has the ground sextet $^6A_1$ and three excited quartet states appropriately spaced in energy. The model has been found to be appropriate for *g*-4.3 high-spin ferric complexes with spin Hamiltonian D values in the range 0.6-1.7 cm^{-1}. It is shown that the model can provide a three-way correlation of the relevant data obtained by Mossbauer, EPR, and optical absorption spectroscopy. (15 refs.)

68096 On the magnetic properties of B_2O_3-PbO-Fe_2O_3-K_2O and B_2O_3-PbO-Fe_2O_3-CaO glasses. E.Burzo, D.Ungur (Nat. Center of Phys., Bucharest, Rumania), I.Ardelean.
J. Phys. (France), vol.44, no.5, p.647-50 (May 1983).
The 20 $Fe_2O_380[3B_2O_3(1\text{-}x)PbOxA_uO_v]$ glasses with $A_uO_v=K_2O$ and CaO were studied by magnetic and Mossbauer effect measurements. The variation of the fraction *r* of ferrous ions is proportional to the difference between the valence of A ions and that of lead as well as to A_uO_v content. The composition dependence of *r* values is analysed in correlation with the glass composition. (9 refs.)

68097 Conversion electron Mossbauer spectroscopy and LEED on epitaxial γ-Fe thin films grown on Cu(100). W.Becker, H.-D.Pfannes, W.Keune (Lab. fur Angewandte Phys., Univ. Duisburg, Duisburg, Germany).
J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.53-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
FCC (γ-)Fe(100)-films prepared by epitaxial growth in UHV on Cu(100)-films were investigated by conversion electron Mossbauer spectroscopy (CEMS) at 295K using a He-CH_4 flow-gas counter. The FCC structure of the Fe films was confirmed by LEED. The Mossbauer spectra clearly demonstrate that γ-Fe(100)-films are paramagnetic at 295K. Depending on the Fe film thickness part of the Fe atoms exists in the α-Fe phase. (10 refs.)

68098 Fe bonding short range order and magnetism in ternary oxide glasses. J.P.Sanchez, J.M.Friedt (CRN, Strasbourg, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.681-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A summary of applications of Mossbauer spectroscopy to the elucidation of electronic, structural and magnetic properties of amorphous materials is presented. Information about short range order and heterogeneity of the distribution of the magnetic element within the glass host inferred from the hyperfine parameter distributions and from magnetic properties respectively is discussed. (4 refs.)

68099 Study of the ion distribution and magnetic properties of Y-Ca-In-Ge iron garnet. Lin Meimei (Dept. of Engng. Phys., Qinghua Univ., Beijing, China), Li Shi, Li Guodong.
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1159-62 (Nov. 1982). [received: April 1983]
Yttrium-calcium-indium-germanium iron garnet (Y-Ca-In-GeIG) is a kind of microwave-ferrite with a low saturation magnetic moment and narrow ferromagnetic resonance line-width. It is obtained by substituting ions into yttrium iron garnet (YIG), and its magnetic properties are closely related to distribution of its cation in the tetrahedral, octahedral and dodecahedral sites, thus in this respect emphasis has been laid on both basic research and practical application. The authors study the distribution of Fe ions by means of the Mossbauer effect and then discuss the relationship between ion distribution and magnetic properties. (12 refs.)

68100 Localization of electrons in Fe-Co alloys. J.Chojcan, M.Szuszkiewicz, S.Szuszkiewicz, B.Rosenfeld (Inst. of Experimental Phys., Wroclaw Univ., Wroclaw, Poland).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K57-60 (1 March 1983).
The authors have previously determined the electron transfer between the components of the BCC alloys Cr-Fe and V-Fe using angular-correlation data from positron annihilation experiments as well as isomer shift data from Mossbauer effect measurements. In the present paper they have extended investigations to polycrystalline BCC Fe-Co systems. The angular distributions (AD) of the annihilation quanta coming from the two-photon annihilation of an electron-positron pair as well as the transmission Mossbauer spectra (MS) of ^{57}Fe in the alloys $Fe_{1-x}Co_x$ (x=0.1, 0.2, 0.3, 0.4, 0.5, 0.6, and 0.7) were measured at room temperature. (11 refs.)

68101 Mossbauer and X-ray study of $FeP_{0.85}Si_{0.15}$. A.Narayanasamy, L.Haggstrom, T.Sundqvist (Inst. of Phys., Uppsala Univ., Uppsala, Sweden).
Phys. Scr. (Sweden), vol.27, no.3, p.217-19 (March 1983).
Silicon/phosphorus substitution in FeP (MnP-type structure, space group *Pnma*) has been studied by ^{57}Fe Mossbauer spectroscopy. The compound $FeP_{0.15}$ was prepared and the unit cell dimensions were determined to be a=5.2267(3) Å, b=3.0704(3) Å and c=5.8321(4) Å. The ^{57}Fe Mossbauer effect shows that increasing the number of Si neighbours around the iron atoms increases the electric quadrupole splitting and the magnetic hyperfine field, and decreases the center shift. The Neel temperatures is 100K and the magnetic structure is similar to that observed in FeP, with the spins bunched along the crystallographic *a*-direction. (12 refs.)

68102 Magnetism and crystalline electric fields in $R_2Fe_3Si_5$ compounds. D.R.Noakes, G.K.Shenoy, D.Niarchos, A.M.Umarji, A.T.Aldred (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. B (USA), vol.27, no.7, p.4317-24 (1 April 1983).
Results of magnetisation, ^{57}Fe, ^{155}Gd, and ^{166}Er Mossbauer-effect measurements on $Gd_2Fe_3Si_5$ and $Er_2Fe_3Si_5$ are presented. There is no magnetic moment on Fe. The Gd Mossbauer results are used to construct an approximate model of the crystalline-electric-field effects in the heavy rare-earth members of the $R_2Fe_3Si_5$ family. This model predicts large magnetic anisotropy in these materials, explains the well-developed static hyperfine interaction seen in the Er resonance spectra up to 4.2K, and overestimates the deviations from de Gennes-law scaling in the magnetic transition temperature. (16 refs.)

68103 Effect of relaxation on the Mossbauer hyperfine spectra of a Γ_8 quadruplet. O.A.Yakovleva.
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1642-6 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2898-904 (Oct. 1982). [received: April 1983]
The Mossbauer spectra of the hyperfine structure of a Γ_8 quadruplet are studied in a situation when the cubic symmetry of the impurity surroundings breaks down due to fluctuations in the crystal field. It is shown that fluctuations can occur that do not lead to complete averaging of the hyperfine interaction in the limit of fast relaxation. The relaxation hyperfine spectra of a Γ_8 quadruplet are then analogous to the static hyperfine spectra of a Γ_6 doublet. The relaxation spectra of a Γ_8 quadruplet are also studied for magnetic relaxation of a special type which preserves, in the limit of fast relaxation, a part of the quadrupole hyperfine interaction. 68104 Dielectric parameters for semiconducting As-Ge-Te and Se-Ge-Te glassy alloys. II. D.R.Goyal, K.N.Lakshminarayan, K.K.Srivastava (Dept. of Phys., Panjab Univ., Chandigarh, India), F.Hufnagel.
Indian J. Pure & Appl. Phys., vol.20, no.12, p.1001-2 (Dec. 1982). [received: April 1983]
Dielectric measurements for some semiconducting As-Ge-Te and Se-Ge-Te glassy alloys are reported. It has been shown, both theoretically and experimentally, that bulk ingots and compressed pellets exhibit similar dielectric behaviour. The theoretical analysis does not provide any evidence of Maxwell-Wagner losses for the suspected inhomogeneities in case of compressed pellets. (10 refs.)

68105 Theoretical results for aqueous electrolytes. Ion-ion potentials of mean force and the solute-dependent dielectric constant. G.N.Patey, S.L.Carnie (Dept. of Chem., Univ. of British Columbia, Vancouver, BC, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.5183-90 (15 April 1983).
The linearized hypernetted-chain theory is applied to solutions of hard spherical ions immersed in a dipole-tetrahedral quadrupole solvent with waterlike parameters. Temperatures ranging from 25 to 300°C are considered and the ion-ion potentials of mean force and the solute-dependent dielectric constant are examined in the infinite dilution limit. For this model electrolyte the ion-ion potentials of mean force are shown to be less structured and to approach the continuum limit more rapidly than those previously obtained for simple dipolar solvents. The limiting slope which determines the behavior of the solute-dependent dielectric constant at low ionic concentrations is negative and much smaller in magnitude than that found for comparable dipolar hard sphere solvents. Finally, the theoretical limiting slope is shown to be consistent with experimental results for aqueous solutions at 25°C and low ionic concentrations. (28 refs.)

68106 The dielectric constant of lamellar semicrystalline polymers. R.H.Boyd (Dept. of Chem. Engng., Univ. of Utah, Salt Lake City, UT, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.505-14 (April 1983).
The problem of representing the dielectric constant of semicrystalline polymers in terms of the dielectric constants and volume fractions of the constituent crystalline and amorphous phases is considered. For locally lamellar morphology, bounds based on uniform electric and displacement fields are derived. The equations also include the degree of crystal orientation as a parameter. For unoriented polymers the bounds are considerably tighter than the Hashin-Shtrikman bounds, the latter being the best possible without knowledge of phase geometries. The bounds presented are sufficiently tight to represent the dielectric constant with practical accuracy for a number of examples of semicrystalline polymers. A treatment is also given of the dielectric constant where the lamellar morphology is further specified as being organised into spherulite-like structures. These bounds are somewhat tighter than the lamellar bounds. (6 refs.)

68107 Dielectric constant of a composite inhomogeneous medium. P.Chylek, V.Srivastava (Nat. Center for Atmospheric Res., Boulder, CO, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5098-106 (15 April 1983).
The authors derive an expression for the effective dielectric constant of a composite medium considering the contributions from both the electric and the magnetic dipole terms. They show that the form of the size distribution of small metallic particles determines the value of the volume fraction at which a sharp increase in AC absorption of a composite material occurs. Depending on the width and mode radius of the size distribution, the effective dielectric constant of a composite medium can be increased by several orders of magnitude. (20 refs.)

68108 Dielectric properties of ammonium fluoroberyllate crystals near phase transitions to an incommensurate phase. B.A.Strukov, V.M.Arutyunova, Y.Uesu (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1732-5 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3061-7 (Oct. 1982). [received: April 1983]
It is shown that in the neighborhood of a commensurate-incommensurate phase transition the permittivity of an ammonium fluoroberyllate crystal is not single-valued, being different for the cooling and heating curves. In a narrow temperature range near the phase transition, the crystal has a two-stage polarization as the electric field increases. It is found that the anomalous hysteresis of the permittivity behaves similarly in the case of $(NH_4)_2BeF_4$ and Rb_2ZnCl_4 crystals. (11 refs.)

68109 Analysis of the unusual position of the low-frequency dispersion region of heterogeneous mixture-spacers system. V.V.Zagoskii, E.A.Zamotrinskaya, T.G.Mikhailnova, V.M.Nesterov (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.590-3 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.14-18 (July 1982). [received: May 1983]
In the paper an analysis is presented of the dependence of the position of the low-frequency dispersion region of a semiconducting heterogeneous specimen-spacers system on the volume concentration of the conducting component, the thickness of the specimen, the thickness (capacity) of the spacers. It is concluded that there exists a surface capacity due to regions of the nonconducting phase of the specimen confined between the spacers and a conducting infinite cluster. (3 refs.)

68110 Spatial dispersion of dielectric permittivity in the theory of solvated electrons and F centers. E.M.Itskovich, A.M.Kuznetsov (Inst. of Electrochem., Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.7, p.824-30 (July 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.7, p.928-34 (July 1982). [received: March 1983]
Wave functions and energies of the solvated electron and of an electron localized near an ion or defect have been calculated by a direct variational method while allowing for spatial dispersion of dielectric permittivity in the medium. In continuous, homogeneous dielectrics, and radius of localization of the solvated electron increases with increasing correlation length in the medium. In cases where one has electrostatic interaction with an ion or defect or short-range interaction with the nearest surrounding molecules (the cavity model), the behavior of the radius of localization depends on the intensity of this interaction. 77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

68111 **Dynamics of radiation-induced charging and discharging of foil electrets.** B.G.Fallone, E.B.Podgorsak (Dept. of Radiation Oncology, McGill Univ., Montreal, Quebec, Canada).
Phys. Rev. B (USA), vol.27, no.8, p.5062-5 (15 April 1983).
The time dependence of the polarization and depolarization current densities, the effective electric field in the electret chamber, and the electret surface charge densities are presented for the radiation-induced foil electret. With the use of the hyperbolic dependence of the ionization-chamber current density on the effective electric field, one obtains excellent agreement between calculated and measured electret polarization and depolarization current densities. (3 refs.)

68112 **Spontaneous polarization of Langmuir multimolecular films.** L.M.Blinov, N.N.Davydova, V.V.Lazarev, S.G.Yudin (Res. Inst. for Organic Intermediate Products & Dyes, Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1523-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2686-91 (Sept. 1982). [received: April 1983]
Three independent experimental methods—measurements of the pyroelectric, piezoelectric, and linear electro-optical effects—are used to demonstrate for the first time the presence of spontaneous polarization in multi-molecular organic films obtained by the Blodgett-Langmuir method. Order-of-magnitude estimates are obtained from the experiment for the pyroelectric coefficients as well as for the parameter $\langle\cos\Theta\rangle$ that determines the deviation from ideal distribution of the molecular dipoles relative to the polar axis of the multilayer (Θ is the angle between the direction of the molecular dipole and the layer axis). (16 refs.)

68113 **Screening of the spontaneous polarization in lead germanate.** V.Ya.Shur, V.V.Letuchev, Yu.A.Popov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1618-19 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2854-6 (Sept. 1982). [received: April 1983]
The authors study the spontaneous polarisation screening in $Pb_5Ge_3O_{11}$. They consider the dynamics of formation of an internal field from a determination of the size of the shift of the dielectric hysteresis loop. (3 refs.)

68114 **A statistical theory for the dielectric properties of thin island films: application and comparison with experimental results.** D.Bedeaux (Inst. for Teoretisk Fysikk, Univ. i Trondheim, Trondheim, Norway), J.Vlieger.
Thin Solid Films (Switzerland), vol.102, no.3, p.265-81 (22 April 1983).
The statistical theory given in ibid., vol.69, p.107 (1980) for the electrical susceptibilities of a thin island film is applied to gold films on a glass substrate. Using the electron micrographs of the films studied experimentally by Norrman et al. (1978), the authors determined the average polarizability of the islands in the direction parallel to the surface. The polarizability density autocorrelation functions were also determined for the films. Using these correlation functions, the optical thickness of the films may be calculated. The agreement of the resulting transmittance with the experimental value was good if the average of the dielectric constants of vacuum and the substrate was used as the inter-island dielectric constant. A theoretical motivation for this choice for metal films is given. It was assumed that the gold islands were, to a good approximation, prolate spheroids. Effects of the image dipoles on the polarizability of the islands as well as on the local field were taken into account. (20 refs.)

68115 **Thermostimulated depolarization currents on a dielectric surface.** C.Huraux, B.Despax (Lab. de Genie Electrique, Univ. Paul Sabatier, Toulouse, France).
Nordisk Isolationssymposium. Nord-IS 82 (Nordic Insulation Symposium. Nord-IS 82), Odense, Denmark, 1982 (Stockholm, Sweden: ASEA 1982), p.7/1-9
Comb-shaped electrodes (obtained from an Al thermal deposit by photoengraving) were used. Surface Thermostimulated Depolarization Current (STDC) spectra were recorded when an insulator was immersed in a gaseous atmosphere (CO_2, He) and compared with STDC spectra recorded on the same specimen in vacuum with the same electrical polarization procedure. New results from glass specimens and a fused silica surface are presented. (2 refs.)

77.40 DIELECTRIC LOSS AND RELAXATION

68116 **Dielectric relaxation and Freedericksz effect.** H.Kresse (Sektion Chem., Martin-Luther-Univ. Halle, Halle-Wittenberg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.569-71 (1983).
The author has found that the dielectric anisotropy $\Delta\epsilon'$ of 4-n-butyloxy-4′-n-pentyl-azobenzene is positive at all frequencies. There is in the MHz region a dielectric dispersion for ϵ'_{π} only which gives a decrease of $\Delta\epsilon'$. By means of the Freedericksz effect a new variant was investigated for the dependence of electrical orientation on the frequency. (8 refs.)

68117 **Molecular relaxation of some rigid polar molecules and their mixtures.** M.P.Maden (Dept. of Phys., Univ. of Prince Edward Island, Charlottetown, Prince Edward Island, Canada).
J. Mol. Liq. (Netherlands), vol.25, no.1, p.25-37 (March 1983).
The dielectric behavior of benzene solutions of four rigid polar molecules, benzophenone, benzotrichloride, ortho- and meta-dichlorobenzenes and their mixtures has been studied in the microwave region over a range of temperatures. The dielectric data has been used to determine the relaxation times and the thermodynamic parameters for the activated state. The relaxation times for single component solutions agree well at temperatures at which literature values are available. The relaxation times for mixtures are consistent with those of other rigid molecules studied previously. The results have been also compared with the computed values obtained from a relation proposed by the authors. (30 refs.)

68118 **Relaxation times of bromo-, iodo- & dichloro-benzenes & their binary mixtures at X-band.** B.N.Baruah, B.Baishya (Phys. Dept., Dibrugarh Univ., Assam, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.1003-4 (Dec. 1982). [received: April 1983]
The dielectric absorption data of three simple substituted benzenes, viz. bromobenzene, iodobenzene, *o*-dichlorobenzene, and their binary mixtures in dilute solutions of benzene are measured at 9.82 GHz and at a temperature of 32°C. From the measured data, the dielectric relaxation times (τ) are determined. Further, the free energies of activation (ΔF_{ϵ}) due to dielectric relaxation are calculated for the single compounds and for binary mixtures. The results are explained on the basis of polarity and molecular environment. (8 refs.)

68119 **Dielectric relaxation of some associated liquids in highly viscous media.** M.Gupta, M.Chauhan, S.K.Saxena, J.P.Shukla, M.C.Saxena (Dept. of Phys., Lucknow Univ., Lucknow, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.796-8 (Oct. 1982). [received: April 1983]
Four polar molecules (phenbol and *o*-, *m*- and *p*-cresols) which are of associative nature have been studied for their dielectric behaviour in highly viscous media consisting of varying mixtures of paraffin oil and *n*-heptane. The associative nature of these molecules has been studied in terms of the dielectric relaxation time (τ), and the viscosity of the medium. The dipole moments (μ) of these molecules have also been observed and the nonlinear behaviour of τ and μ has been attributed to the varying amount of aggregation of the solute molecules in various solvents. (17 refs.)

68120 **Relaxation time for binary mixtures of polar liquids.** B.B.Swain (Postgraduate Dept. of Phys., Ravenshaw Coll., Cuttack, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.839-40 (Oct. 1982). [received: April 1983]
The dielectric relaxation times (τ) of mixtures of methyl alcohol with (i) toluene, (ii) chlorobenzene and (iii) n-butanol in different proportions taken in solution in CCl_4, were determined following B.S. Sarma and V.V. Rao's single frequency concentration variation method [Aust. J. Phys. (Australia) 27 (1974) 87]. The values of τ agree with values calculated using Debye's relaxation. The extrapolated value of τ for pure methanol agrees with literature value. (3 refs.)

68121 **Dielectric losses in zinc oxide ceramics.** B.K.Avdeenko, A.S.Tonkoshkur, I.M.Chernenko (Dnepropetrovsk State Univ., Dnepropetrovsk, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.866-9 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1028-31 (June 1982). [received: Feb. 1983]
The effect of the addition of small amounts of Bi_2O_3, Co_3O_4, MnO_2, and Sb_2O_3 on the electrical properties of sintered zinc oxide and ceramics with the composition $aZnO.bBi_2O_3.cCo_3O_4.dMnO_2.eSb_2O_3$ has been investigated. The conductivity of sintered zinc oxide depends significantly on the component added (it changes from 10^2 to 10^{-9} S/cm when 0.5 mole % Bi_2O_3 is added). (8 refs.)

68122 **Experimental and theoretical approach to molecular dynamics of pyridine derivatives and related molecules from dielectric relaxation measurements. I. 2.3′-bipyridyl in the liquid state.** P.Freundlich, E.Jakusek, H.A.Kolodziej, A.Koll, M.Pajdowska (Inst. Chem., Univ. Wroclawski, Wroclaw, Poland), S.Sorriso.
J. Phys. Chem. (USA), vol.87, no.6, p.1034-8 (17 March 1983).
Dielectric relaxation measurements and theoretical calculations were performed on 2,3′-bipyridyl in the liquid state, in the frequency and temperature ranges of 1.8-40 GHz and 293-323K, respectively. A complex dielectric absorption band was found that can be interpreted as being due to the presence of two rotations involving, respectively, the whole molecule and the heterocyclic rings about the C-C central bond. Theoretical calculations of the total interaction energy (as sum of dipole-dipole interaction energy; strain and deformation energies, and the π-electron energy) between the two hexatomic moieties do not exclude the possibility of internal rotation around the C-C bond. Macroscopic dielectric relaxation times were also calculated for both rotations. The activation energy barriers for the two molecular motions were derived. (12 refs.)

77.50 DIELECTRIC BREAKDOWN AND SPACE-CHARGE EFFECTS

68123 **Effects of electrode materials on tree initiation in polyethylene under switching surge conditions.** N.Yoshimura, F.Noto (Dept., of Electrical Engng., Akita Univ., Akita, Japan).
IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.2, p.120-4 (April 1983).
Four kinds of electrode materials were used. Also, the effects of oxidised Al on the tree initiation was investigated. When a positive switching surge is applied to the needle in a point-to-plane test, little difference is found to exist among the four electrode materials with respect to the stress at the tip of the needle, E_{max} required to produce a tree. When a negative switching surge is applied, it is found that there are large differences of E_{max}. The value of E_{max} increases with the work function of the electrode materials. In addition, with negative polarity, E_{max} increases with the rise time of the impulse wave in a manner which is related to the interaction of work function and space charge effects. It is noted that oxidized Al has a higher E_{max} than non-oxidized Al. When a positive half cycle wave follows a negative half cycle, the value of E_{max} for the positive pulse is reduced from the value for a unipolar positive pulse by an amount which correlates with the work function of the electrode. (8 refs.)

68124 A study of emission lines from electrical trees. C.Laurent, C.Mayoux, S.Noel, N.I.Sinisuka (Lab. de Genie Electrique, Univ. Paul Sabatier, Toulouse, France).
IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.2, p.125-30 (April 1983).
A study has been made of the gases appearing in the channels of bush and branch-like electrical trees propagating in low density polyethylene (LDPE) and cross-linked polyethylene (XLPE) subjected to a strong alternating electric field. The emission lines in the spectral range from 300 to 700 nm were observed with a monochromator and a vidicon tube followed by a multichannel analyzer. These lines, characteristic of the gaseous mixture created by the action of discharges on the channel walls, revealed the presence of CO, CO_2, and H_2. The evolution of these lines was followed as a function of time. (16 refs.)

68125 High temperature breakdown characteristics in polyethylene film with fixed electrodes. K.Yahagi, A.Okinaka, S.Katakai (Dept. of Electrical Engng., Waseda Univ., Tokyo, Japan).
IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.2, p.138-42 (April 1983).
Electrical breakdown was investigated in films of low-density polyethylene by the application of both pulsed waveform and ramped voltages. Stainless steel ball electrodes and the film to be measured were embedded in a thermoset resin. The breakdown strength F_B increased with temperature T, $\partial F_B/\partial T>O$, between about 80°C and 100°C by application of impulse voltages. This temperature range corresponds to a region of heat absorption in DSC curves. The input energy rate from impulse voltage melts the crystalline lamellae and causes an increases of electrical breakdown strength. (8 refs.)

68126 Decomposition products of silicone liquid due to electric discharge. T.Suzuki, S.Murakami, S.Kobayashi, K.Kiyotaki, M.Umeda (Toshiba Corp., Kawasaki, Japan).
IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.2, p.152-7 (April 1983).
Silicone liquid can be used at relatively high temperatures, for instance as an impregnant in transformers for use in trains, because it has high thermal stability and low flammability. The authors describe decompositions of silicone liquid due to electrical discharges, such as arc discharge and partial discharge. It was found that hydrogen, carbon monoxide and cyclic dimethyl siloxane (D_4) are produced due to electrical discharge as in the case of thermal degradation. However, only one kind of dimethyl siloxane (D_4) was found, whereas D_3, D_4, D_5, and D_6 were found in thermal degradation. Moreover, the ratio of the gaseous products to cyclic dimethyl siloxane compounds for partial discharge is much smaller than the same ratio for arc discharge. In both cases the ratio is much larger than the ratio found for thermal degradation. (5 refs.)

68127 Water absorption during water treeing in polyethylene [comment and reply]. W.T.Starr (Raychem., Menlo Park, CA, USA), C.T.Meyer.
IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.2, p.171 (April 1983).
For original paper see ibid., vol.EI.18, no.1, p.28-31 (1933). Comments on the way the numerical analysis has been used to examine the process of water treeing. (1 ref.)

68128 Numerical analysis of steady-state thermal breakdown. M.Hikita, M.Ieda (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan), G.Sawa.
J. Appl. Phys. (USA), vol.54, no.4, p.2025-9 (April 1983).
An procedure for numerically solving the fundamental equations of steady-state thermal breakdown has been presented. Assuming an ionic conduction and using the published experimental condition data for poly (ethylene-terephtalate) film, the current-voltage characteristics, the temperature dependence of the critical electric field, and the profiles of temperature and field in the bulk at a constant ambient medium temperature are given. The calculations indicated that moderation of field distortion occurs if a nonlinear field dependence of conduction current is used in place of Ohm's law. The degree of the moderation of field distortion depends on the functional form of the temperature and field dependence of conduction current and the magnitudes of parameters involved therein. Unless these are established and a quantitative evaluation of the thermal breakdown process based on them are made, thermal breakdown cannot be excluded as a possible mechanism for thick samples of polymers. (11 refs.)

68129 The dielectric breakdown properties, current density-voltage and capacitance-voltage characteristics of ion-beam-synthesized Si_3N_4 layers. A.D.Yadav, M.C.Joshi (Dept. of Phys., Univ. of Bombay, Bombay, India).
Thin Solid Films (Switzerland), vol.102, no.3, p.187-99 (22 April 1983).
Si_3N_4 layers were synthesized by 30 keV $^{14}N_2^+$ ion implantation into silicon at room temperature to a total dose of 10^{18} ions cm^{-2}. Studies of the dielectric breakdown strength and the current density-voltage and capacitance-voltage characteristics were carried out on unannealed samples and on samples annealed in various ambients. The dielectric breakdown strength of ion-beam-synthesized Si_4N_4 layers decreases after thermal annealing treatments. The currents through these layers were ohmic for low voltages and space charge limited for higher applied voltages. The electrically dead layer of damaged silicon underlying the ion-beam-synthesized Si_3N_4 dielectric thin film recovers completely to monocrystalline form after vacuum annealing at 900°C for 2.5 hours. 77.55 DIELECTRIC THIN FILMS

68130 Optical properties and structure of very thin dielectric films. G.M.Mansurov, V.I.Pshenitsyn, Yu.F.Shchetnev, E.V.Kichenko, V.M.Zolotarev.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.844-6 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.142-5 (July 1982). [received: March 1983]
The EM-11N low-voltage electron microscope, and the Perkin-Elmer model 580 spectral instrument with a computer, were used to carry out a systematic investigation of very thin dielectric films. Films of SiO_2 obtained on Ge substrates by different methods: electron-beam evaporation, and molecular deposition were studied. Both types of films revealed nonlinearity in the variation of the absorption as a function of the thickness in the MATR spectra. Electron-microscope photographs showed the island nature of the films. This result agrees with the general physical representations of the nonuniform structure of the surface of a solid. (8 refs.)

77.60 PIEZOELECTRICITY AND ELECTROSTRICTION

(for piezo-optical effects, see 78.20H)

68131 Free vibrations of a piezoelectric layer of hexagonal (6 mm) class. H.S.Paul, D.P.Raju, T.R.Balakrishnan (Dept. of Math., Indian Inst. of Technol., Madras, India).
Int. J. Eng. Sci. (GB), vol.21, no.6, p.691-704 (1983).
An asymptotic method due to J.D. Achenbach (1969) is used to analyze the free vibrations. In this method, the displacement components, the electric potential and the frequency are expressed as power series of the dimensionless wavenumber $\epsilon=2\pi\times$Layer Thickness/Wavelength. Substituting the expansions of field variables and the frequency in the field equations of piezoelectricity and in the boundary conditions, a system of coupled, second order, inhomogeneous, ordinary differential equations with thickness variable as the independent variable is obtained by collecting the terms of same order ϵ^n. Integration of such systems of differential equations yields the various terms of the series expansions for the field variables and the frequency, for all modes and in the whole range of frequencies, in a range of the dimensionless wavenumber $0<\epsilon<\epsilon^*<1$ where ϵ^* increases as more terms are retained in the expansions. The frequency coefficients reduce to the corresponding ones in the elastic case as a limit. The exact frequency equation in the case of plane strain is obtained and analyzed numerically. (11 refs.)

68132 Electrostriction in the piezoelectric crystals $Bi_{12}GeO_{20}$ and $Bi_{12}SiO_{20}$. K.S.Aleksandrov, V.S.Bondarenko, V.M.Zrazhevskii, M.P.Zaitseva, B.V.Sobolev, Yu.I.Kokorin (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1806-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3181-4 (Oct. 1982). [received: April 1983]
The authors report a determination of the matrix of electrostriction coefficients R_{mnij} for the piezoelectric crystals $B_{12}GeO_{20}$ and $Bi_{12}SiO_{20}$. To detect the small displacements they have used an electromechanical strain gauge of the capacitive type, having a sensitivity to displacements $\sim10^{-11}$ cm. The gauge was wired into a circuit with an external oscillator. (8 refs.)

77.80 FERROELECTRICITY AND ANTIFERROELECTRICITY

68133 Ferroelectromagnets. G.A.Smolenskii, I.E.Chupis (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Usp. (USA), vol.25, no.7, p.475-93 (July 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.3, p.415-48 (July 1982). [received: April 1983]
The results are presented of the theoretical and experimental studies of ferroelectromagnets—crystals with magnetic and ferroelectric ordering. Considerable attention is paid to reviewing the results of the phenomenological analysis of the influence of the magnetoelectric interaction on the thermodynamic properties of ferroelectromagnets, their reaction to constant and variable electric and magnetic fields, the spectrum of spin waves and ferroelectric oscillations and the methods of exciting them. A table is presented of the expected magnetoelectric effects. The existing experimental studies of magnetoelectric interactions are described and the possible applications of ferroelectromagnets are discussed. A table is given of the known ferroelectromagnetic compounds. (162 refs.)

77.80B Transitions and Curie point

68134 Direct observation of ferroelectric phase in $Pb_{1-x}Sn_xTe$. K.-P.Mollmann, K.H.Herrmann, R.Enderlein (Dept. of Phys., Humboldt-Univ., Berlin, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.582-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
For the first time a direct proof of ferroelectric behaviour in strongly doped lead tin telluride is given. The structural phase transition from the paraelectric to ferroelectric phase is also seen in the galvanomagnetic and photoelectric properties. An explanation of the observed properties is given by connect-

ing the local Jahn-Teller reconstruction of the lattice around defects with the structural phase transition. (15 refs.)

68135 Ferroelectric phase transitions in $CsLiWO_4$. S.V.Mel'nikova, P.V.Klevtsov, L.I.Zherebtsova, A.I.Kruglik, L.A.Shabanova, V.N.Voronov (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1623-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2862-3 (Sept. 1982). [received: April 1983]
The authors study the ferroelectric phase transition in $CsLiWO_4$ by measuring the twinning process in polarized light and the dielectric constant and spontaneous polarization. They made X-ray measurements of the distortions of the cell for polycrystalline samples in the temperature range 80-270K. In addition, they have measured the speed of elastic waves in $CsLiMoO_4$ by a pulsed-ultrasound method in the cubic phase. (3 refs.)

68136 Effect of defects on the ferroelectric phase transitions in crystals of the proustite family. N.D.Gavrilova, V.K.Novik, T.V.Popova (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1735-8 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3068-73 (Oct. 1982). [received: April 1983]
A study is made of the effect of external factors (illumination, electric field, mechanical stress) and defects (vacancies, radiation defects, the thickness of the crystals, the level of uncontrolled impurities in the original materials) on the phase transitions in proustite crystals at 28K, involving a change of symmetry $3m \rightarrow 1$. A photograph of the dielectric hysteresis loop of proustite is obtained for the first time and confirms the symmetry of the ferroelectric phase. Curves of the temperature dependence of the dielectric constant, pyroelectric coefficient, and resistivity of pyrargyrite are measured; the curves indicate that there is a first-order phase transition in this crystal at 4.8K. The possible changes of symmetry at this transition are discussed. (15 refs.)

77.80D Domain structure and effects; hysteresis

68137 Domains in crystals of the barium-strontium niobate type. M.F.Dubovik, O.D.Kolotii, G.V.Maisov, B.P.Nazarenko (All-Union Sci. Res. Inst. of Single Crystals, Scintillation Materials & Ultrapure Chem. Substances, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.848-52 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1008-12 (June 1982). [received: Feb. 1983]
The formation of a real domain structure in crystals of complex niobates, which in most cases are disordered solid solutions, depends on the degree of stoichiometry of the composition and the structural defects. Therefore, in order to obtain high-quality single crystals of complex niobates of the BSN type, it is necessary to carefully observe the thermal conditions, which determine the formation of such defects as screw dislocations with a Burgers vector parallel to the polar axis, where the microdomains are preferentially formed. (15 refs.)

68138 Ferroelectric domains of a new type: closed loop domains at twinning boundaries. L.I.Dontsova, N.A.Tikhomirova, S.A.Pikin, L.A.Shuvalov (Inst. of Crystallography, Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.223-6 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.181-4 (20 Sept. 1982). [received: April 1983]
The ferroelectric crystal guanidine alumosulfate hexahydrate, $[C(NH_2)_3].[Al(H_2O)_6][SO_4]_2$ (GASH), is known to belong to the class $3m(C_{3v})$ over its entire range of existence and to lack a paraelectric phase. It decomposes when it reaches the Curie point [see, for example, F. Jona and G. Shirane, Ferroelectric Crystals, Pergamon, New York, 1962 (Russ. transl. Mir, Moscow, 1965)]. The 180° GASH domains are optically indistinguishable. The domain structure has accordingly been studied by a decoration method [B. Hilczer et al., Phys. Status Solidi a28, k101 (1975), and F. Suda et al., J. Phys. Soc. Jpn. 45, 916 (1978)] and by an electroluminescence method {I.S. Zheludev et al., Kristallografiya 7, 147 (1962) [Sov. Phys. Crystallogr. vol. 7, 121 (1962)]}. (7 refs.)

68139 Equilibrium domain shape in internally stressed uniaxial ferroelectric crystals. V.V.Gene, V.I.Shul'ga (M.I. Arsenichev Dneprodzerzhinsk Industrial Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.600-3 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.25-8 (July 1982). [received: May 1983]
The domain shape in pure intrinsic uniaxial ferroelectrics is altered by the application of an electric field perpendicular to P_s, or by mechanical stress. (7 refs.)

68140 Photochromic effect in alkali halide crystals doped with NO_3^- ions. L.M.Belokrinitskaya, L.I.Berezhinskii, I.N.Khalimonova.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.846-9 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.145-9 (July 1982). [received: March 1983]
The investigations were carried out on KI, KBr, and KCl crystals with NO_3^- ions grown in a platinum crucible in air by the Czochralski method with heating of the melt by high-frequency currents. The specimens were irradiated at room temperature with a DRSh-250 lamp through a UFS-1 filter. The thickness of the specimens was chosen in relation to the intensity of the investigated absorption bands and the concentration of NO_3^- ions and ranged from several tenths of a millimeter to several millimeters. (8 refs.)

68141 Optical properties of small metal spheres: surface effects. P.Apell (Phys. Dept., Univ. of Pennsylvania, Philadelphia, PA, USA), D.R.Penn.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1316-19 (25 April 1983).
It has been assumed that the optical properties of small spheres can be understood by means of a Drude dielectric function that incorporates a boundary scattering rate $1/\tau_s \simeq v_F/R$, where v_F is the fermi velocity and R is the sphere radius. An effective scattering rate $1/\tau_s = f v_F/R$ is calculated and f is evaluated as a function of photon frequency. The largest contribution to f is due to the electron density profile of the sphere rather than the boundary scattering that is reduced an order of magnitude by electron screening. (20 refs.)

68142 Preservation of optical selection rules in an amorphous semiconductor. M.H.Brodsky (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), D.P.DiVincenzo.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.971-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
In amorphous solids, distinguishable region of order exist that can be modeled by regular polytopes in curved (non-euclidean) spaces. Selection rules govern hypothetical physical processes, e.g., optical absorption, in such high symmetry non-euclidean structures. The authors show an analogy between curved space azimuthal angular momentum m and crystal momentum k. The selection rule $\Delta m=0$ corresponds to a vertical $\Delta k=0$ transition in a crystal. In amorphous Si, a remnant of the crystalline k selection rule exists near the 1.1 eV absorption edge. (10 refs.)

68143 Anisotropy of nonlinear absorption of light by free carriers in *n*-type germanium. V.L.Malevich (Inst. of Electronics, Acad. of Sci., Minsk, Belorussian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1313-14 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2035-7 (Nov. 1982). [received: April 1983]
Reports a calculation of the nonlinear absorption of light by free electrons in n-type germanium, taking account of the many-valley form of the electron spectrum and the anisotropy of electron-phonon scattering. The case considered is that in which the photon energy is much greater than the mean electron energy, and the carrier energy and momentum scattering is mainly by acoustic phonons. The electron gas in the semiconductor is assumed not be degenerate. (9 refs.)

78.20D Optical constants and parameters

68144 Nonlinear regression analysis for the Sellmeier dispersion equation of CdS. B.J.Pernick (Res. & Dev. Center, Grumman Aerospace Corp., Bethpage, NY, USA).
Appl. Opt. (USA), vol.22, no.8, p.1133-4 (15 April 1983).
The wavelength dependence of the index of refraction of transparent solids is best represented by Sellmeier's equation $n^2=A+B/(\lambda^2-C)$, where n is the refractive index and λ the wavelength. The constant C has physical significance as the square of the absorption edge wavelength associated with the material's band gap, where $\lambda^2>C$. In practice, the constants A, B, and C are to be evaluated from experimental data. In cases where a priori knowledge of the value of C is not in hand, a linear least-squares method to determine the constants fails. Other formulas relating refractive index and wavelength are essentially empirical relations convenient for linear least-squares analysis and are interpreted as series expansions of the above expression. Consequently, the author presents a nonlinear regression analysis pertaining to the specific functional form of Sellmeier's equation. (7 refs.)

68145 Thermal change of the refractive index of a linear absorber by an intensive light wave. D.Senderakova, P.Vojtek (MFFUK, Bratislava, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.2, p.105-14 (1983).
The paper deals with the possibility of studying thermally induced refractive index changes, which arise when an intensive light wave passes through the index, by the method of phase-modulation of a probe light pulse. The method described here does not depend on the mechanism of inducing refractive index

changes. Thermal perturbations of the refractive index of an absorbing medium, which had been induced by a Q-switch ruby laser pulse, were studied experimentally. In the course of experiments both water solutions of $CuSO_4.5H_2O$ and ethanol solutions of a brilliant green were used. (6 refs.)

68146 Cermets of Cu-PbI_2 thin layers: fabrication and determination of optical constants. J.-M.Theriault, G.Boivin (Dept. de Phys., Univ. Laval, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.4, p.612-16 (April 1983).
The authors describe a method of fabrication of metal-dielectric mixtures (cermets) deposited by vacuum evaporation. The study is mainly concerned with co-evaporated mixtures of copper and lead iodide. The stabilization of the evaporation rate of copper and lead iodide enables the authors to obtain a homogeneous mixture of these two materials whose mass concentration C is determined from a previous calibration. Photometric measurements carried out on these films lead to the determination of the optical constants N (the index of refraction) and K (the coefficient of absorption). They present the results obtained for mixtures of low concentration in copper. These results are compared with those obtained from the Maxwell-Garnett theory. (23 refs.)

68147 Optical constants and thermal radiative properties of CO_2 cryodeposit. S.Tsujimoto (Dept. of Mech. Engng., Kyoto Univ., Kyoto, Japan), A.Konishi, N.Terada, T.Kunimoto.
Cryogenics (GB), vol.23, no.5, p.251-7 (May 1983).
The optical constants of CO_2 cryodeposit were measured in the wavelength range from 2.5 μm to 21.4 μm below 90K. The peak assigned to the Q branch of ν_3 which grew largely at lower temperatures was found and was considered to show that the linearity of the molecule was broken due to the increase in lattice imperfections. The data of the real part of the complex refractive index at 4000 cm^{-1} were applied to obtain the density of CO_2 cryodeposit as a function of temperature. The result showed that the number of voids and lattice imperfections increases at lower deposition temperatures. The measured optical constants were analysed by dispersion equations to be used for the calculation of the optical properties and thermal radiative properties of surfaces with CO_2 cryodeposit. (26 refs.)

68148 Optical characteristics of Ni-Cr alloys in the solid and liquid states. K.M.Shvarev, N.I.Vnukovskii, B.A.Baum, P.V.Gel'd (Ural Polytech. Inst., Sverdlovsk, USSR).
High Temp. (USA), vol.20, no.4, p.540-4 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.653-7 (July-Aug. 1982). [received: April 1983]
The parameters of the complex index of refraction of Ni-Cr alloys with 0-50 at.% chromium are investigated by polarimetry over the wavelength range 0.37-2.65 μm. The electronic characteristics of the alloys investigated in the IR region are evaluated, including the plasma frequencies and relaxation frequencies of the s-like and hybridized s-d electrons. A correlation is established between the optical properties and the electrical conductivity of the alloys. The emissive characteristics of Ni-Cr alloys in the normal direction at 1600°C are calculated. (16 refs.)

68149 Temperature dependence of residual light transmission in lithium niobate single crystals. N.M.Bezdetnyi, A.I.Bezhanova, M.F.Dubovnik, E.A.Drogaitsev, V.G.Sil'vestrov (All-Union Sci.-Res. Inst. of Single Crystals, S.M. Kirov Azerbaidzhan State Univ., Azerbaidzhan SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1011-13 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1199-201 (July 1982). [received: Feb. 1983]
The temperature dependence of residual light transmission (RLT) is characterized by a certain periodicity and the RLT is minimum ($\sim$1% cm^{-1}) at 263-293K and rises by 3-5 times at 213-333K. Upon heating of the specimens in hydrogen their electrical conductivity rises by more than two orders, the RLT variation range diminishes 2-3 times, and the temperature range of RLT stability widens from 223 to 333K. (5 refs.)

68150 Dispersion of the refractive index of InP and ZnTe. B.Jensen, A.Torabi (Dept. of Phys., Boston Univ., Boston, MA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2030-5 (April 1983).
An analytical expression for the real part of the refractive index n near the fundamental absorption edge is given in terms of experimentally known quantities for a given semiconductor. It is derived from a quantum mechanical calculation of the complex dielectric constant which assumes the band structure of the Kane theory. The expression obtained is a function of the bandgap energy, the effective electron and heavy hole masses at the band edge, the spin orbit splitting energy, the carrier concentration for n- or p-type materials, the temperature, and the frequency of the incident radiation. Also involved is the value of n at the fundamental absorption edge, which is not accessible to measurement. However, an equation for n at the absorption edge can be found in terms of experimentally obtainable values of n near the absorption edge and solved to give the desired quantity. The refractive index can then be predicted to a high degree of accuracy over the entire frequency spectrum up to the band edge. In particular, the dispersion near the fundamental absorption edge which has been observed experimentally for a number of III-V and II-VI compounds is predicted and its precise calculation enabled. Within limits of the above statement regarding n at the absorption edge, there are no adjustable parameters involved. This constitutes a significant improvement over previous theories of the refractive index of a semiconductor, which typically involve several adjustable parameters. Theory is compared with available experimental results for InP and ZnTe. A method of determining the heavy hole effective mass from measurement of n in compounds where it is unknown is discussed. (27 refs.)

68151 Measurement of the indices of refraction and the absorption coefficients of dielectric materials in the millimeter wave region. B.H.Ahn (USAERADCOM Night Vision & Electro-Optics Lab., Fort Belvoir, VA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2123-4 (April 1983).
The indices of refraction and absorption coefficients of $LiNbO_3$, $LiTaO_3$, GaAs, and Stycast HiK, a plastic dielectric material, which are used frequently for millimeter wave device fabrication, were measured at 55 and 112.5 GHz using a Fabry-Perot transmission technique in waveguide. (17 refs.)

68152 Electronic and ionic polarizabilities in some rutile type crystals. E.Iguchi, H.Sawatari, H.Satoh (Dept. of Metall. Engng., Yokohama Nat. Univ., Yokohama, Japan).
J. Solid State Chem. (USA), vol.47, no.2, p.239-41 (April 1983).
It has been proposed that certain transition metal oxides with a high dielectric constant as well as large refractive indices such as TiO_2 (rutile), WO_3, and H-Nb_2O_5 use crystallographic shear planes to accommodate nonstoichiometry. In view of the correlation between a high dielectric constant and crystallographic shear planes, the relaxation due to polarisabilities seems to be one of the factors which predisposes such material to this type of stoichiometric change. To reveal this correlation in greater depth, the authors have calculated the electronic and ionic polarisabilities of rutile, because more reliable experimental data are available for this crystal, compared to WO_3 and H-Nb_2O_5. (18 refs.)

68153 Hyperfrequency (35×10^9 Hz) study of the complex permittivity of SiO_2-xNa_2O binaries. A.Dravet, M.Alyari, D.Bourret, R.Sempere, A.Bandhyopadhay, J.Regnier, J.Zarzycki.
J. Phys. Colloq. (France), vol.43, no.C-9, p.115-18 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The interferometric technique was used at 35×10^9 Hertz (Q-band) to investigate the complex permittivity of SiO_2-xNa_2O glasses, with regard to their hydration. Each minimum of the interference fringes has been described by thirty one points. A microvoltmeter driven by a computer allowed a rapid measurement. The glasses have been prepared by two methods: direct melting from silica powder and sodium carbonate, and the bubbling of water vapor and nitrogen in the melt of these compounds. Three compositions: $74SiO_2$-$26Na_2O$; $66SiO_2$-$33Na_2O$ and $55SiO_2$-$45Na_2O$ have been explored with temperature from 20 to 500°C. Variations of ϵ' and ϵ'' are influenced by the Na_2O concentration and the type of preparation of the glasses. Differents quantities of water have been determined by deconvolution of the 2800 cm^{-1} and 3600 cm^{-1} infrared bands. (7 refs.)

68154 Optical and other physical properties of $Al(PO_3)_3$-containing fluorophosphate glasses. J.Yasi, J.Fusong, G.Fuxi (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
J. Phys. Colloq. (France), vol.43, no.C-9, p.315-18 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The optical and some other physical properties of fluorophosphate glasses in binary systems containing $Al(PO_3)_3$ and the influence of various fluorides on the properties of glass with low $Al(PO_3)_3$ content have been studied. The positions of low $Al(PO_3)_3$ content glasses in $n_d\sim\nu$ diagram have been plotted and the partial properties of fluorides in glass have been calculated. (3 refs.)

68155 Absorption of picosecond light pulses by CdTe single crystals. R.Baltrameyunas, Yu.Vaitkus, M.Pyatrauskas.
Opt. & Spectrosc. (USA), vol.53, no.3, p.341-2 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.575-6 (Sept. 1982). [received: May 1983]
Reports a study of the nonlinear absorption of ultrashort light pulses by n- and p-type CdTe single crystals. The authors have identified some distinctive features in this interaction. (8 refs.)

68156 The optical constants of phases in cast aluminium alloys. I.Aydin (Deloro Stellite GmbH, Koblenz, Germany), H.-E.Buhler.
Prakt. Metallogr. (Germany), vol.20, no.3, p.105-17 (March 1983). In English, German.
The optical properties of aluminium and aluminium compounds were investigated using interference film metallography. Most of the compounds belong to the group of highest reflectivity phases, in which a very good brightness contrast can only be attained with high refractive and absorbing sputter coatings. The optical constants (refractive index and absorption coefficient) were determined for a series of aluminium solid solutions and compounds. (14 refs.)

68157 Auger recombination and non-linear refraction in cadmium-mercury telluride at 10.6 μm. J.R.Hill, G.Parry, A.Miller (Royal Signals & Radar Establ., Malvern, England).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.410-12 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Measurement of power dependence of the far field width of an incident beam of 10.6 μm radiation, with a Gaussian profile, after passage through a polished crystal of $Cd_{0.21}Hg_{0.79}Te$ at 175K has led to the observation of a non-linear refractive index change. The magnitude of the change was found to be $\Delta n=-(7.0\pm3.5)\ 10^{-3}\ I^{1/3}$ where I is the incident intensity in W/cm^2. The $I^{1/3}$ dependence is explained by the predominant role of Auger recombination in limiting the saturation of band edge resonant adsorption. The position of optical components prior to the sample is also considered and is shown to be of fundamental importance in the interpretation of the results. (7 refs.)

68158 Optical reflectivity and band structure of black phosphorus. H.Asahina (Dept. of Phys., Tohoku Univ., Sendai, Japan), Y.Maruyama, A.Morita.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.419-21 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The optical reflectivity measurement was performed on a cleaved surface of black phosphorus single crystal at room temperature for linearly polarized monochromatic light in the range from 0.7 to 3.0 eV. The theoretical reflectivity spectra to be compared with the observed ones were calculated using the band structure obtained by the self-consistent pseudopotential method. The theoretical spectra are in good agreement with the observed ones in shape, magnitude, and polarization-dependence. (8 refs.)

68159 Optical transitions in oriented polyacetylene. D.Baeriswyl, G.Harbeke, H.Kiess, E.Meier, W.Meyer (Labs. RCA Ltd., Zurich, Switzerland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.617-19 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Calculations of the conductivity tensor for π-band transitions give new results on the anisotropy of the dielectric function. The intrinsic optical absorption coefficient for linear polarization has been measured on thin films consisting of highly aligned fibers and was found to be in qualitative agreement with the theory. (13 refs.)

68160 Photoabsorption in amorphous semiconductors using a wave guided CO_2 laser. E.Zeldov, K.Weiser (Dept. Electrical Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.983-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A low energy probe beam ($h\nu\sim$0.1 eV) was used in a wave-guided configuration for photoabsorption (PA) experiments on a-As_2Se_3 using intense pulsed excitation. The results suggest saturation of bandtails and give information about densities of states and the recombination constant. (12 refs.)

68161 The effect of charged additives on the mobility gap and thermal activation energy of $As_2Se_3Cu_x$. Y.Sawan, M.El-Gabaly, N.Kollias (Kuwait Univ., Kuwait).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.995-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Presents and discusses the experimental results of the changes in the optical gap, (mobility gap), and the shape of the optical absorption edge, which were determined at room temperature, using the photoacoustic technique on powdered samples as well as changes in the thermal activation energy, E_{th}, for

glassy alloys $As_2Se_3Cu_x$ ($0 \leq X \leq 1$). It is shown that as X increases from 0 to 1, E_g (at room temp.) and E_{th} decrease from 1.82 eV to 1.30 eV and from 0.92 eV to 0.36 eV, respectively. In all samples ($E_c - E_f$) was found to be nearly constant (1.13 ± 0.02 eV), which indicates a gradual shift of E_v towards E_f by increasing Cu in alloys (max. shift=0.52 eV for X=1). Furthermore, the slope of the exponential tail of the absorption edge was found to decrease and its width to increase by increasing Cu. So far, this behaviour is not reported experimentally for any of chalcogenide materials. A model which takes into consideration ESCA analysis results is presented. (12 refs.)

68162 Time-resolved optical measurement of Si lattice temperature during nanosecond pulsed laser annealing. K.Murakami, H.Itoh, K.Takita, K.Masuda (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1024-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Time-resolved Si-lattice temperature during pulsed laser annealing has been measured by an interference method, namely a time-resolved optical reflectivity measurement of Si on sapphire (SOS). The time-resolved lattice temperature can be determined from the time-dependent interference variation induced by small changes in the refractive index due to variations of the lattice temperature during pulsed laser annealing. It is found that the Si-lattice temperature for 2.0-μm and 0.6-μm SOS increases to at least 1040K and 1220K, respectively. The maximum temperatures obtained are independent of the substrate temperatures between ~25 and 300K. (10 refs.)

68163 Optical absorption from polarons in a model of polyacetylene. K.Fesser, A.R.Bishop, D.K.Campbell (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4804-25 (15 April 1983).
The authors present a theoretical calculation, within a continuum electron-phonon-coupled model, of the optical absorption due to polarons in polyacetylene $[(CH)_x]$. The results can be applied to both trans- and cis-$(CH)_x$, as well as potentially to other polymers (polypyroles, polyparaphenylenes) in which polarons are present. They establish that the essential signature of polaron absorption is the existence of three separate absorption peaks in the gap with qualitatively different features. For trans-$(CH)_x$, they compare and contrast this structure with that from the kink solitons, which are expected to dominate the optical absorption at all but the lowest doping levels. For cis-$(CH)_x$ and related polymers, they discuss polaron (and multipolaron) absorption and the relation of polarons to possible excitons in these materials. Finally, they evaluate briefly the existing experimental situation regarding optical absorption in polyacetylene and indicate possible future experiments that could confirm the existence of polarons in $(CH)_x$ and similar polymers. (45 refs.)

68164 Optical response of Cermet composite films in the microstructural transition region. U.J.Gibson, R.A.Buhrman (School of Appl. & Engng. Phys., Cornell Univ., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5046-51 (15 April 1983).
Measurements of the intrinsic optical constants *n* and *k* have been made on Au-Al_2O_3 Cermet thin films with metal-fill fractions above and below the percolation threshold. The simple Maxwell-Garnett effective-medium theory, which is successful at low-metal-file fractions, is shown to be inadequate in the description of the system near this threshold, where the microstructure of the composite undergoes a radical change. A modified effective-medium theory, based on a probabilistic growth model recently introduced by Sheng [Phys. Rev. Lett. 45, 60 (1980)] is found to predict the optical response in the transition region with few adjustable parameters. (10 refs.)

68165 Current state of a semiconductor in the field of a strong electromagnetic wave. Ya.G.Girshberg, N.N.Trunov (A.I. Gertsen Pedagogical Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1646-50 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2905-11 (Oct. 1982). [received: April 1983]
It is shown that the absorption coefficient of a semiconductor with an interband electron-phonon coupling in a strong saturating field increases with increasing field and remains finite in the absence of recombination. The special features of the anomalous photogalvanic effect in a strong field, which occur in the ordered phase of a ferroelectric crystal, are studied. (8 refs.)

68166 Optical permittivity of a covalent crystal. V.Ya.Al'tshul', V.K.Bazhenov, A.G.Petukhov (I.I. Mechnikov State Univ., Odessa, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1657-60 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2925-30 (Oct. 1982). [received: April 1983]
The optical permittivity tensor of a covalent crystal is evaluated making allowance for the local field effects and the effect of a static exchange correlation interaction of valence electrons. A comparison of the calculated results with the standard random phase approximation for homogeneous systems indicates that the local field effects lead to a shift of the characteristic optical bands in the spectrum of a covalent crystal toward higher frequencies, but such a shift can be compensated by the exchange correlation interaction. (12 refs.)

68167 Dimensional effect in optical spectra of anthracene crystals. M.S.Brodin, A.N.Lipovchenko, S.V.Marisova, V.N.Myasnikov.
Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.468-9 (March 1983). In Russian.
The authors found that the refractive index dispersion of anthracene crystals, changes when crystal thickness is reduced. This points towards the effective decrease in the oscillator strength of the excitonic transition in thin crystals. The results are discussed using a theory which takes into account the delay of the electromagnetic interaction in bounded crystals. (5 refs.) *V.G.P.*

78.20F Birefringence

(inc. stress birefringence, flow birefringence, etc)

68168 Birefringence of $Zn_xCd_{1-x}S$ near the isotropic point. W.Gunning, J.Tracy (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA), H.Rufer.
Appl. Opt. (USA), vol.22, no.8, p.1192-3 (15 April 1983).
The birefringence of the mixed crystal $Zn_{0.14}Cd_{0.86}S$ has been measured near its isotropic point and found to be highly dispersive. The region of strong dispersion shifts to shorter wavelengths than observed in pure CdS, and its magnitude near the isotropic point is larger. These results are highly significant for the development of narrowband dispersive birefringent filters in the blue-green region of the spectrum. (11 refs.)

68169 Birefringence study of a phase transition in TGS crystals. W.J.Kusto (Lab. of Appl. Phys., Delft Univ. of Technol., Delft, Netherlands).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.284-5 (March 1983).
Accurate measurements of the optical birefringence over the temperature range 20-80°C have been made for the uniaxial ferroelectric triglycine sulfate (TGS) along the ferroelectric b-axis. An anomaly at the Curie temperature is clearly seen. A slight deviation from Landau-like behaviour is observed in the temperature range $0°C \lesssim T\text{-}T_C \lesssim 7°C$, which is in agreement with recently obtained results on the dielectric, thermal and elastic properties. (11 refs.)

68170 'Four-fold' refringence in quartz. V.K.Semenchenko, I.T.Bodnar, V.A.Isupov (Inst. of Phys. of Solids & Semiconductors, Belorussian Acad. of Sci., Minsk, Belorussian SSR).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.375-81 (1983).
An attempt is made to interpret the simultaneous existence of four refractive indexes (two ordinary and two extraordinary) near the α-β phase transition in quartz from the optical point of view. The theory of thermodynamical stability predicts the appearance of fluctuation areas of the α- and β-phases in the vicinity of the α-β transition. On the basis of this theory the formation of infinite clusters, consisting of the merged fluctuation ranges, is assumed. (31 refs.)

78.20H Piezo-, elasto- and acousto-optical effects

68171 Ultrasonic switching of a bistable liquid crystal cell. W.Hamidzada, S.V.Letcher (Dept. of Phys., Univ. of Rhode Island, Kingston, RI, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.785-7 (1 May 1983).
The response of a twisted nematic cell to a tone burst of ultrasound has been investigated. The cell is more sensitive than an ordinary nematic cell, and because it has two stable configurations, can store the acoustic signal. Over a wide range of acoustic pulse widths, the threshold for switching from one stable to the other depends on the total acoustic energy of the pulse. (15 refs.)

68172 Photoelastic properties of a two-level system in the field of a strong electromagnetic wave. G.N.Shkerdin (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1575-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2782-6 (Sept. 1982). [received: April 1983]
The resonant acoustooptic interaction due to an electron polarizability of a two-level system in the field of a strong electromagnetic wave is studied theoretically. An expression for the permittivity of the system is derived in a situation when an acoustic wave is propagated in a crystal. It is shown that

under resonance conditions the amplitude of the permittivity modulation by an acoustic wave is determined by two mechanisms: the modulation by an acoustic wave of the energy of a resonance transition of the system and the modulation of the population of the levels in the system due to interference of different diffraction order of the electromagnetic wave propagated in the crystal. It is shown that a coupled system of equations for the amplitudes of diffraction orders becomes nonlinear when resonance transitions are saturated. The resulting dynamics of the acoustooptic interaction changes considerably when the saturation of resonance transitions by a diffracting electromagnetic wave takes place. (12 refs.)

68173 Acoustooptic parameters of calcium molybdate crystals. L.P.Avakyants, V.V.Antipov, D.F.Kiselev, N.G.Sorokin, K.V.Zakutailov (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1799-800 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3171-2 (Oct. 1982). [received: April 1983]
Optimisation of the parameters of acousto-optic devices requires the knowledge of the entire matrix of photoelastic constants. The authors measure all of the components of the elastic modulus and photoelastic constant tensors by the Brillouin scattering method. (4 refs.)

78.20J Electro-optical effects

68174 Study of the electrochromic effect in vanadium and tungsten oxides. V.I.Gavrilyuk, I.M.Chernenko.
Inorg. Mater. (USA), vol.18, no.7, p.993-4 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1176-8 (July 1982). [received: Feb. 1983]
Study of the electrochromically colored oxides of vanadium (V) and tungsten (III) by IR spectroscopy and proton magnetic resonance showed that together with the probable injection of positive ions into V_2O_5, the predominant process during electrochromic coloring of vanadium oxide, in contrast to tungsten trioxide, is an electrochemical reduction as a result of which an oxygen-defect layer is formed in the surface region of the V_2O_5 sample. (4 refs.)

68175 Analytical and numerical calculations of the transient and the steady-state electric birefringence for a sudden application of a sinusoidal electric field of sufficient strength. H.Watanbe (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan), A.Morita.
J. Chem. Phys. (USA), vol.78, no.9, p.5311-16 (1 May 1983).
The transient and the steady-state electric birefringence for a sudden application of a sinusoidal electric field $E(t)=E_0 \cos \omega t$ of sufficient field strength was studied. An analytical expression which is valid up to the fourth power of E was obtained. For stronger electric fields, the electric birefringence was calculated numerically by making use of the Runge-Kutta-Gill method. The effect of the field strength on the dispersion of the birefringence was demonstrated for several ratios of the contribution of the permanent dipole moment and the induced dipole moment. The contribution of harmonics in the birefringence signals in the nonlinear region is expressed as the Fourier components of the signals. (7 refs.)

68176 A possible mechanism of light absorption. S.L.Kraevskii.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.824-8 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.116-22 (July 1982). [received: March 1983]
The author discusses the electrochromism effect in amorphous films and glasses, and the opinion that light is absorbed by polarons of small radius (PSR). It is shown that the application of this mechanism encounters appreciable difficulties, and a different mechanism is proposed which takes into account the interaction of injected electrons with each other and with the cation-compensators of an injected charge. (16 refs.)

68177 Initial stage in the redistribution of photoinduced charges and electric fields in $Bi_{12}SiO_{20}$. V.V.Bryksin, L.I.Korovin, V.I.Marakhonov, A.V.Khomenko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1686-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2978-84 (Oct. 1982). [received: April 1983]
The dynamics of the electric field distribution in a photorefractive crystal is discussed for the case of a uniformly illuminated sample and a direct photocurrent. It is shown that for times less than the trap thermal ionization time the field has a maximum as a function of the coordinate, which moves away from the illuminated electrode at a rate which decreases to zero in the course of time. Thereafter, the maximum remains stationary but increases linearly with time. The coordinate dependence of the field was measured for $Bi_{12}SiO_{20}$ samples with exposures corresponding to the arrest time of the maximum with various external fields. Comparison of theory and experiment gave a value for the photocarrier mobility in the conduction band multiplied by the band electron trapping time. (9 refs.)

68178 A more exact formula for Kerr effect in liquids and a comparison with experiment. M.F.Vuks.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.6-14 (Feb. 1983). In Russian.
A more exact formula for the Kerr constant in liquids is derived. The comparison of the theoretical values with experimental ones for many polar and nonpolar liquids shows a satisfactory agreement in the absence of dipole association. (19 refs.)

78.20L Magneto-optical effects

68179 Nonlinear far-infrared magnetoabsorption and optically detected magnetoimpurity effect in *n*-GaAs. C.R.Pidgeon, A.Vass, G.R.Allan (Dept. of Phys., Heriot-Watt Univ., Edinburgh, Scotland), W.Prettl, L.Eaves.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1309-12 (25 April 1983).
Measurements have been made of CW nonlinear far-infrared magnetoabsorption in pure, partially compensated *n*-GaAs. A new optical observation of the magnetoimpurity resonance has been demonstrated. Analysis in terms of a three-level model gives effective lifetimes of ~ 0.5 μs 'off resonance' and 30 ns 'on resonance', implying the possibility of laser action in the former case. (10 refs.)

68180 Laser-induced magneto-optical transitions from deep levels in n-InSb. D.G.Seiler, M.W.Goodwin, K.H.Littler (Center for Appl. Quantum Electronics, Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.167-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Oscillatory structure in the magneto-photoconductivity induced by CO_2 and CO lasers in high purity n-InSb at liquid helium temperatures is shown to arise from deep levels located ≈ 74 and ≈ 170 MeV below the conduction band. (3 refs.)

68181 Magneto-optics of cadmium arsenide. M.Singh, P.R.Wallace (Service des Champs Magnetiques Intenses, CNRS, INSA, Toulouse, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.441-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Using the band structure model of Bodnar (1977) the authors have calculated the frequency and wavenumber dependent electronic dielectric tensor of Cd_3As_2 in the presence of a magnetic field, for arbitrary direction of the field relative to the c-axis of the crystal. This involves calculating not only the energy levels but also the 8-component wave functions and the current matrix elements. The magneto-optical properties of the material in both the Faraday and Voigt configuration are discussed on the basis of this calculation. (5 refs.)

68182 Magnetooptical study of semimagnetic alloys $Cd_{1-x}Mn_xTe$. G.Rebmann (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France), C.Rigaux, G.Bastard, M.Menant, R.Triboulet, W.Giriat.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.452-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The splitting of the exciton state in magnetic field is studied by reflectance experiment on concentrated $Cd_{1-x}Mn_xTe$ alloys. A linear decrease of the splitting is observed as a fuction of x, inferring a zero magnetization for $x_0 \sim 0.61$ corresponding to the antiferromagnetic phase transition. Absorption spectra of concentrated alloys show several absorption bands resulting from the excitation of manganese 3d states. (16 refs.)

68183 Simple methods for analyzing interband magneto-optical data of Kane-type semiconductors: application to Cd_3As_2. J.-P.Jay-Gerin (Dept. de Medecine Nucleaire et de Radiobiologie, Univ. de Sherbrooke, Sherbrooke, Quebec, Canada), E.K.Arushanov, M.J.Aubin.
Solid State Commun. (USA), vol.46, no.7, p.537-40 (May 1983).
Three simple methods are derived for analyzing interband magneto-optical data of isotropic Kane-type semiconductors yielding straight line plots from which band structure information is determined. To illustrate the results, data obtained with cadmium arsenide (Cd_3As_2) are analyzed. (12 refs.)

68184 Interference spectra of magnetic polaritons. V.P.Kochereshko, G.V.Mikhailov, I.N.Ural'tsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1529-33 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2697-704 (Sept. 1982). [received: April 1983]
Optical dispersion of the exciton ground state is studied by the spectrum interference analysis method of thin CdSe crystals. A comparison of the calculated dependences of the dispersion of the refractive index of optical exciton waves on the magnetic field with the observed transmission spectra can be used to determine the dispersion parameters of a magnetic polariton and study their dependences on the magnetic field. The first observation of a magnetogyration effect of optical exciton waves is reported. (11 refs.)

68185 The nature of the Faraday effect in the paramagnetic rare earth garnet $Tb_3Ga_5O_{12}$. U.V.Valiev, G.S.Krinchik, S.B.Kruglyashov, R.Z.Levitin, K.M.Mukimov, V.N.Orlov, B.Yu.Sokolov (V.I. Lenin State Univ., Tashkent, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1596-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2818-20 (Sept. 1982). [received: April 1983]
The authors report the results of measurements of the Faraday rotation and the magnetic susceptibility of gallium terbium garnet $Tb_3Ga_5O_{12}$ which is paramagnetic to 0.8K. The measurements of the Faraday effect and of the susceptibility were carried out on the same samples, which were in the form of 1 mm thick disks, cut along the (111) plane from single crystals that were grown from solution in the melt. The Faraday rotation was measured at the laser wavelengths 0.63 and 1.15 μ in the temperature range 85-300K by the method involving magnetooptical modulation of the angle of rotation. (8 refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

68186 Identification of pentachlorobiphenyl isomers by application of diffuse reflectance Fourier transform infrared spectroscopy. R.A.Nyquist, C.L.Putzig, D.P.Peterson (Analytical Labs., Dow Chem. Co., Midland, MI, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.140-53 (March-April 1983).
The IR spectra presented are useful for scientists engaged in the isolation and identification of polychlorobiphenyl isomers via spectral comparison. The IR correlations presented should also be useful in the identification of other polychlorobiphenyl isomers, especially in cases where the mass spectral data for the corresponding fractions are also available. (5 refs.)

68187 Investigation of Raman spectra of $LiNbO_3$:MgO crystals. Liu Si-min, Zhang Guang-yin (Dept. of Phys., Nankai Univ., Tianjin, China).
Acta Phys. Sin. (China), vol.32, no.1, p.103-7 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
Raman spectra of $LiNbO_3$:MgO crystals has been obtained for the first time and compared with Raman spectra of pure $LiNbO_3$ crystals. No change of the number, frequency, and relative intensity of Raman spectra lines of $A_1(TO)$ and $E(TO)$ mode is found. There are only a very little increase in the line width. It is shown from this result that the more intensive Raman spectral lines of $A_1(TO)$ and $E(TO)$ vibrational mode are contributed by (NbO_6) oxygen octahedra characteristic group of $LiNbO_3$ crystals. (15 refs.)

68188 Raman spectra and structural phase transitions of the perovskite-type layer compounds $RbAlF_4$ and NH_4AlF_4. M.Couzi, P.L.Loyzance, R.Mokhlisse (Lab. de Spectroscopie Infrarouge, Univ. de Bordeaux I, Talence, France), A.Bulou, J.L.Fourquet.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.232-5 (March 1983).
The low frequency (0-600 cm^{-1}) Raman spectra of $RbAlF_4$ and NH_4AlF_4 single crystals have been studied at different temperatures ranging from 20 to 600K, in their various structural modifications. It is concluded that the transition of NH_4AlF_4 occurring at ~150K is purely an order-disorder transition, governed by the reorientational dynamics of the NH_4^+ ions. For $RbAlF_4$, the observed phase transitions at 553 and 282K are both related to displacive mechanisms, as evidenced by the observation of soft-modes, but also to disordering processes probably connected with the AlF_6 octahedra. (12 refs.)

68189 Phase transition and vibrational spectra of l-leucine. D.Bougeard (Inst. fur Phys. & Theoretische Chem., Univ. Essen, Essen, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.279-83 (March 1983).
A phase transition was observed at 80°C in crystalline l-leucine. The transition heat was estimated to 170 J/mol by a DSC measurement. The analysis of the IR- and Raman spectra and some MNDO conformational analyses show that the transition is purely of conformational type without disorder effect, mostly localized in the alkyl side chain and nearly without effect on the double layer structure. (17 refs.)

68190 Surface-enhanced Raman study of the solid/liquid interface: conformational changes in adsorbed molecules. C.J.Sandroff, S.Garoff, K.P.Leung (Exxon Res. & Engng. Co. Corporate Res.-Sci. Labs., Linden, NJ, USA).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.547-51 (22 April 1983).
Surface-enhanced Raman scattering was seen from 1-hexadecane thiol adsorbed on silver-island films. The adsorbed amphiphile in contact with air and water exhibited similar trans, or solid-like structures. In contact with chloroform which wets the thiol-coated film, there was a decrease in the number of trans conformations. (13 refs.)

68191 Novel features in the stereochemistry of octacyanides: phase transition in tetra-n-butylammonium octacyanotungstate(V). A.Samotus, A.Kanas, S.Hodorowicz, J.Czerwonka (Inst. of Chem., Jagiellonian Univ., Krakow, Poland), J.Sciesinski, Cz.Paluszkiewicz.
Polyhedron (GB), vol.1, no.11-12, p.779-80 (1982).
Tetra-n-butylammonium octacyanotungstate(V) has been found to exist in three phases at the temperature range 90-353K. The IR and ^{1}H-NMR spectra as well as thermogravimetric and power diffraction studies support these structural changes. The phase transitions were found in the temperature range 273-283K (T_1) and 33-343K (T_2). (8 refs.)

68192 Characters of local dynamics and local structure inferred from far infra red spectroscopy. A.Gerschel (Chimie Phys. des Materiaux Amorphes, Univ. Paris Sud, Orsay, France).
J. Mol. Liq. (Netherlands), vol.25, no.1, p.51-78 (March 1983).
The author provides a review of molecular liquids which deal with the state of progress, the identification of basic problems and tentative suggestions as how research on basic problems might be organized. He stresses some main uses, teachings and limits of FIR spectroscopy in pure dipolar liquids. He explains to what extent experimental bandshapes and band intensities can be useful to specify some general features of the dynamics and structure in simple molecular liquids. (31 refs.)

68193 Study of the structure of strontium- and titanium-containing aluminosilicate glass by Raman scattering. N.M.Bobkova, N.A.Borushko, L.M.Silich (Polytech. Inst., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.5, p.718-20 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.856-8 (May 1982). [received: Feb. 1983]
Using the method of Raman scattering, it was found that there are $[TiO_4]$ and $[TiO_5]$ groups, but no $[TiO_6]$ group in the structure of strontium- and titanium-containing aluminosilicate glass. Six-coordinate titanium only appears in crystallization of glass in the form of anatase and rutile, as confirmed by the findings of X-ray diffraction analysis. (6 refs.)

68194 Optical absorption below the absorption edge in $Hg_{1-x}Cd_xTe$. J.A.Mroczkowski, D.A.Nelson (Electro-Optics Operations, Honeywell, Lexington, MA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2041-51 (April 1983).
